This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

WALLACE'S MONTHLY.

VOL. XVIII. MARCH, 1892. No. 1.

Entered according to Act of Congress, in the year 1891, by AMERICAN TROTTING REGISTER ASSOCIATION, at Washington, D. C.

TERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

PENNANT, 2:15.

- PENNANT, 1968 ..... 2:15
  - ABE DOWNING, 709 .....
    - Joe Downing, 710, son of Edwin Forrest, 49.
    - daughter of Harrison, son of Park's Highlander.
  - LOUISA DUVALL .....
    - Harold, 413, son of Hambletonian. 10.
    - daughter of Duvall's Mambrino, son of Mambrino Chief, 11.

IT is one of the very encouraging features of the trotting horse breeders' achievement that several strains are being clearly and surely established, as far-sighted, conservative people would view with alarm the in-breeding of the past forty years continued for another score. There is good ground for the belief that the cross of Abe Downing, of virtually strong thoroughbred strains, on the so-called distinctly trotting lines is as potent for highest results on the trotting turf as any yet attained by the distinguished senator of the "Golden Gate" through any of the outcrosses he has made. The continuation of trotting capacity, especially the quality of endurance through three or more generations to come, is demonstrated in the get of Pennant as certain of no impairment, where all other conditions are faithfully observed along the line. The conditions which continually bring a subject into still more favorable light kindle anew, from season to season, the fire of a devotion whose increasing intensity is its best evidence of being genuine. "I like the Abe Downing colts," remarked a gentleman on the outside—one not a horseman and not a breeder, yet one of the people who have passion for the beautiful, combined with utility, in a sense that affords a sort of domestic comfort—"because you can get up to 'em." "I have no interest in those wild dispositioned fellows, whose eye commands one to keep his distance," this speaker further remarked. It is not intended, however, to convey the idea here that all other strains of blood are void of the domestic trait. Many others have it, and it is only mentioned because enough of the higher order of the equine race are without it to cause anxiety about the horse's disposition. For several years Abe Downing and a goodly number of his progeny were shown at the Iowa State Fair, where, besides their unequaled record in the show ring, in which they were exhibited in both the trotting and roadster classes, and in which Abe Downing was never beaten, nor second, except to Pennant (his son), the latter as a show horse, holding an unbeaten record; the masses were always devoted

Digitized by Google

friends of the Willow Lawn stables, on general principles, in part because the beauties were readily approachable. Such a blaze of inborn quality at the surface indicates the real fire of modern merit—one fed by the fuel of some substance, as it were, akin to electricity, only animated and directed by an almost human intelligence. Pennant was but eleven years of age when, in 1891, his trotting record was reduced from 2:17 of 1890 to 2:15. In 1887 his first record of 2:23¾ was made in a winning race at the Twin Cities track, and besides numerous within hair-breadths of a place with the best on the race-course, he has won his way steadily, and trotted heats better than 2:20 nearly every season since his advent into the circle of performers—and there is yet strong probability that with his continued vigor of the prime of life, he will at least rank in the 2:12 list. His speed, too, thus far, is not of the artificial brand, as an amateur who had never before driven a horse faster than three minutes, drove him a mile in 1890, in 2:17. Until 1891 it may be said that he really never had the training of an expert hand, though his performances prior to this time were highly creditable to his drivers. The disposition to go, and an inherent tendency to extreme speed, established by an ancestry of swift ones, must be conceded. Hambletonian 10, through Harold, claims, rightly, a generous share in the greatness of the present premier of Willow Lawn. It has often been the ready explanation of Pennant's extreme speed, by exclusively Hambletonian admirers that, with a dam by the sire of Maud S., 2:08¾, no farther consideration of genealogy in search of speed origin is worth the debating. The critical, fair-minded student of blood lines, must, however, concede other probable sources a good share of the credit for the dazzling record directly attributed to the sire of our subject in hand. That Harold must divide the honors, in some measure, is proven in the fact that two of the get of Abe Downing with records 2:13 and 2:15¾ do not trace in any way to Harold, and have only a remote connection with the great Hambletonian. The record of Pennant is the best of any of the produce of Harold's producing dams, and is very prominent among his descendants in the scale of high speed. Truly, grand and kingly is the record of Harold, but Mambrino Chief shares some of the honors in question as grandsire of the second dam, and Tom Hal, the grand old pacer, as well as imp. Glencoe, are not to be omitted when the contribution of Louisa Duvall to the "make-up" of this game race trotter is considered. But to Edwin Forest 49 due credit must be given, being nearer than Mambrino Chief or Tom Hal, and in equal remove with Hambletonian (barring equivalent blood) through Enchantress, by Abdallah I. As progenitor through dams of So So 2:17, Angelina 2:18¼, Charleston 2:15, Lockheart 2:14¾, Nancy Hanks 2:09, London 2:20½, Mambrino Dudley 2:19¾, Mike Wilkes 2:15¾ (p), etc., and through their sire of the brothers Pat Downing 2:13 and Chronometer 2:15¾ (pacing), Edwin Forest is taking a place among extreme speed producers that commands highest respect. Justified are the many enthusiastic admirers of the great sire whose individual merit claimed freely the confidence of Woodburn's far-famed proprietor. Every unbiased Kentuckian who knew the son of Young Bay Kentucky Hunter remembers his symmetry and is warm in sentiment toward him. Large, powerful, beautiful—embodying every quality of an ideal equine, it is not strange that his owner could scarcely be restrained from madly rushing into certain death to rescue his fond favorite from the flames. Perpetual and all-enduring are his monuments in the living records of the extreme speed of his descendants, second to none, all things considered. His son Joe Downing has a flattering record, as has his producing dam, Lizzie Peebles (grandam also of Kitty Bates 2:19, and Monroe Chief 2:18¼ and great-grandam of Charleston 2:15). Thus it may be confidently claimed that the Abe Downing lines of breeding are heavy laden with the enduring blood, and form a fitting counterpart for the fashionable pedigree of Louisa Duvall. Fortunate, indeed, is it for the interests of the trotting turf that the Messrs. Bowman own this grand horse, as they will give him and his get the widest

Digitized by Google

opportunity. Two daughters, the first trained, Umbria, 2:25¼, dam by Mambrino Paris, and Nerissa, 2:26¼, dam by Almont, are on the way to the 2:15 list—certain, almost, to reach the 2:20 station this year. A good variety of stallions will found in the stud at Waverly, such as Chronometer, 2:15¾ (brother of Pat Downing, 2:13), dam by the great Mambrino Abdallah, 2:20, sire of dams of Mary Marshall, 2:12⅓, and three other 2:15 performers; also a brother, Chronograph, Almont Thorne 5188, by Almont 33, dam by Alcalde (by Mambrino Chief 11, out of a daughter of Pilot Jr. 12), second dam by Abdallah 15, is siring grand youngsters out of Abe Downing and Pennant fillies that are certain to be fast. King Gothard, by George W. Wilkes' great son, St. Gothard (sire of 12 performers), dam by Happy Medium, can but render sure the extreme speed quality in future generations. A weanling son of Jaybird, dam by Mambrino Boy, promises Allerton's equivalent in speed as in blood. Others by Wickliff and Young Jim, crossed on mare by Mambrino Boy, Abe Downing and other great brood mares, sires, along with the three score of mares of the farm, only intensify the highest expectations. With a goodly number of Abe Downing and Pennant mares, as well as several by such sires as George Wilkes, Almont, Mambrino Abdallah 2201, Mambrino Paris, Woodford Abdallah 1654, Mambrino Boy, Almont Thorn, etc., with which the stud has been stocked, there can be no doubt but that Willow Lawn Farm will continue in the prominent place it now occupies. Development of speed is a part of the regular program there. More than twenty-five of the horses and colts are being jogged regularly this winter, and every indication points to lower records and more of them. Mr. C. L. Weeks, the principal driver, who gave Chronometer, Pennant and his two mares, Umbria and Nerissa, their marks, and Mr. George Bates, superintendent of the breeding department, are doing good service for the horse of the future as well as the present. Visitors who appreciate good stock will find a cordial welcome by them, as well as from the large-hearted proprietors, when it is in the way of any of our readers to spend a day at their immense farm, adjoining the beautiful village of Waverly, Iowa.

RAY MARSHALL.

THE FUTURE OF SUNOL.

EDITOR OF THE MONTHLY:

In reply to your note I would state that Charles Marvin is to train Sunol during the coming season for the purpose of lowering her record. I intend to send her to him just as soon as the track will be fit to work on. As you are aware, Mr. Marvin has always handled her, and as I have entire confidence, not only in his ability as a trainer, but in his character as a man, I would not for one moment think of making a change, notwithstanding the published reports to the effect that another trainer was to have her this season.

I have been jogging Sunol nearly every pleasant day during the winter. She is doing splendidly. Her feet and legs are in fine condition, and she is as free from soreness or lameness as any horse I ever sat behind; consequently I have great expectations that she will materially lower her record this year. She was not in condition to do herself justice during the past season, having been lame during the great part of the summer. When she trotted in 2:08¼ she had two preparatory miles only, and that, as you know, was not enough to condition her. Senator Stanford, in a letter to me in December last, stated that if it had not been for this lameness he would have sent her to me with a record of 2:06, or better. During the recent sale of his horses in New York City, the Senator said, and I quote his exact words: "I consider Sunol the despair of all horsemen." He has timed her a quarter in 29½ seconds, and says she did it quite comfortably. When she made her record of 2:08¼ she trotted the last quarter in 31¼ seconds—a 2:05 gait—showing that she was not exhausted. I mention these facts to justify my belief that she will materially lower her record this year. Besides, Mr. Marvin says that she has

Digitized by Google

not only more speed than any horse he has ever seen, but he believes she could beat any horse in the world a race of three in five heats if he were only permitted to match her. He says that he drove her a quarter in her two-year-old form in 30⅛ seconds. The question has been asked, if she had as much speed as that, then why did she not trot faster than 2:18 as a two-year-old? Senator Stanford and Charles Marvin ought to be able to answer that question better than I can, and I will let them do it. The Senator says: "She was not developed in her two-year-old form," and under date of December 3, 1891, he writes: "I am not prepared to say what Sunol might have done as a two-year-old, but I believe that with a thorough preparation she would have done a great deal better than she did." Mr. Marvin, in his book on "Training the Trotting Horse," a book, by the way, that every lover of the horse ought to read, says that Sunol had never been driven a mile at speed in her life until August 1, when she trotted in 2:40½, and repeated in 2:38. Four days afterward she won a two-year-old race in 2:34½, 2:25. About one month ago he said to me: "No other two-year-old ever had her speed. Had I known as much when she was two years old as I know now, there is no telling where she would have trotted." The first man to call my attention to Sunol was Peter C. Kellogg. When he was on a visit to California, in 1888, he wrote to me under date of August 26, of that year: "Horse matters are lively out here and many splendidly bred young things are growing up and trotting fast. Sunol, by Electioneer, dam by Gen. Benton, 2d dam thoroughbred Waxy, by Lexington, is conceded by everybody to be a wonder. As Marvin has broken down nearly everything that he has trained this year, he has grown superstitious, or timid, and says that he will make no more use of her than necessary."

One remark in conclusion, and I think it is due to Senator Stanford, that I should state this: Fifteen years ago, on the night that he bought Electioneer from Mr. Backman, he said to a party of New Yorkers who were present: "Gentlemen, in a few years I expect to bring some of this horse's produce back here and beat you all."

The public can judge how his prediction has been fulfilled.

ROBERT BONNER.

New York, February 18.

PROBLEMS IN FARRIERY.

BY S. T. H.

The Weight-bearing Portions of the Hoof.

PRELIMINARY MENTION: The many private letters addressed to the writer from known and unknown horsemen, and from every section of the country, is a gratifying evidence that Problems in Farriery are occupying the minds of intelligent students almost equally with the breeding question. The concentration of American investigation upon this specialty, which means the focusing of the highest type of mechanical insight, coupled with an intellectual power, that has brought all departments of physical science to their present state of perfection, will eventuate in the advancement of farriery far beyond its standard of to-day.

These letters are carefully filed, and the inquiries therein contained noted in a memorandum book, so that their answers may appear in their proper connection. As the subject alluded to comes in its natural sequence, the writer has no pretensions to the wisdom of an oracle, nor does he assume that he has mastered all the difficulties of horse-shoeing. For more than a decade he has given this subject profound study, not only in its literary phases, but as a daily roadite, and by frequent visits to the forge, where he has spent weeks and months watching the practical operations of skillfully forging shoes and dressing feet, without which practical training all would be intangible theory. He owns more than a dozen road horses, some of which have

Digitized by Google

trotted in and below the twenties, as the result of his own tuition, every one of which has his feet dressed and the shoes fitted and fastened by their owner. In the preparation of these papers the practical knowledge thus gained at the forge, on the road and the track, supplemented by a mastery of the anatomy and physiology of the horse's foot and limb, and a patient digest of all the leading authorities in English, French, German and Italian farriery, has been made to do efficient service. Still, the writer claims to be only on the threshold of this vast, still-beginning, never-ending subject. Like Chaucer's scholar, "gladly would he learn, and gladly teach." He therefore prizes these letters of inquiry, and earnestly urges all of his kindly readers to send to the office of the MONTHLY, to his address, all possible problems that may have come to their minds, either theoretically from their reading, or practically from difficulties in the feet and gait of their own horses. These inquiries are the most effective means of practically compassing the wide field of farriery, and will serve to make these papers more comprehensive and exhaustive than can possibly come within the purview of a single mind.

Two inquiries will be noticed in this connection as a sample of the interest and thought bestowed upon this important subject. One comes from the manager of the Reno Electric Light and Power Company, in picturesque Nevada. He desires to know when the axes of the pastern and the hoof are in a continuous line—"immediately after landing, or just when?" He refers to the rule laid down by the English premium essayist, Mr. George Fleming, on this subject. These axes are in coincidence only when the horse is at rest. Draw a line in front, or what is a more palpable mechanical demonstration, place a straight edge in front of the hoof and pastern. If the hoof has been carefully prepared with reference to the proper length of the toe and the normal height of the heels, the anterior surfaces of the pastern and the hoof will be in a continuous straight line. In no other position can the proper resolution of the weight and concussion at every footfall be perfectly adjusted. Let it be remembered that the weight descends perpendicularly down the limb from the carcass to the ankle in the front limbs, and that *at the ankle* the resolution of the force takes place. *One-half continues in the perpendicular line to the ground behind the hoof and is lost. The other half is deflected and follows the axis of the pastern.* Now, if the axis of the pastern is in a line with the axis of the hoof, the deflected weight and resultant concussion passes down this continuous line, with the least possible damaging results, to the ground, where it is also lost. But if the axis of the pastern forms an angle with the axis of the hoof, then a second resolution of the force takes place *in the hoof*, one-half following a line in continuation of the axis of the pastern, and the other half following the axis of the hoof. This resolution of the force in the hoof is fraught with many serious consequences, among which may be mentioned corns and the various forms of acute inflammation of the foot, that are too often relegated to occult causes beyond the diagnosis of the faculty. It is obvious that the basis of this mechanical action must be when the limb and foot are at rest, for the revolution of the same varies so greatly in different horses, dependent upon the height and length of their stride, that at no other time and in no other position could the calculation be made than when the weight is upon the foot just before it springs from the ground.

Passing now from distant Nevada to one of the most prominent breeding establishments of trotters, nearer to the center of the continent, the proprietor is the fortunate owner of one of the choicest bred sons of George Wilkes, whose speed he seeks to still further develop by a more scientific preparation and armament of his front feet. He thus describes his peculiarity of action: "The horse toes out a little in front "when standing, but in action so far "as I can judge, his stroke is straight, "without twist of limb or feet....His "action is not too high in front in knee "motion, but, to my mind, his ankle and "fetlock action is too rapid, which, in "consequence, shortens the reach of his "forward stroke. Please give instruc-

Digitized by Google

"tions as to the way you would shoe him "so as to lower and lengthen his stroke "forward and correspondingly equalize "his action behind."

The writer's quandary has led him into a palpable contradiction. In one sentence he says *his knee action is not too high*, and in the next he desires instructions how to *lower* and lengthen the forward stroke. To the contradiction of thought he adds confusion of language. The ankle and fetlock are only different terms for the same joint. The ankle action does not determine the forward action. That is controlled by the relative length of the muscles of the forearm reaching to the knee when compared with their tendonous prolongations extending from the knee to the anterior and posterior ridges of the coffin-bone. The flexor muscles of the forearm raise the limb by contraction. The joints of the limb, consisting of the knee, ankle and foot or coffin joint, are instantly articulated, simultaneously backward by the contraction of the flexor tendon. The flexor tendons are merely extensions of the flexor muscles of the forearm. At the same instant the extensors are strained to their greatest tension by reason of the doubling up backward of the limb and foot. When the limb reaches its greatest elevation backward the extensors relieve themselves by throwing the limb and foot forward, which action in turn strains the flexors to their greatest possible extension. Thus the articulation of the extremities is, physiologically speaking, the alternate extension and contraction of the flexor and extensor muscles. Now, as the flexor and extensor tendons that work the ankle and coffin joints, or the fetlock and foot, are simply the prolongations of the flexor and extensor muscles, it is a physical impossibility for the ankle and the hoof to articulate, or for the flexor and extensor tendons to operate independently in the slightest degree of the flexor and extensor muscles. From this resume of the mechanical action of locomotion, our correspondent will perceive that the ankle or fetlock articulation has no agency whatever in determining the length of the forward stroke. Nor can it work quicker than the knee and coffin joints, for all are alike absolutely controlled by precisely the same flexor and extensor muscles. If the ankle joint moves too quickly then the coffin and knee joints also move too quickly. If the horse has high, rapid, trappy, forward action, then the muscles of the forearm are relatively short when compared with their tendonous prolongations, and also with the muscles of the hip and gaskin.

They can only be measurably regulated in their operation. Weight, either in the shoe or in the form of toe weights, only aggravates the height and rapidity of their action, for the will power is thereby additionally taxed to overcome the extra weight, which it does by causing the flexor muscles to raise the extra weight by an extra exertion both quicker and higher than when the feet are armed with light racing plates. The relative length of the muscles of the forearm and their tendonous prolongations taken in connection with the length and obliquity of the pasterns, and the peculiar growth of the feet, cause the peculiarities often noticed in planting the hoofs upon the ground. For instance, some horses spank their heels first upon the road in trotting action, while others land flat-footed. The former are chronically afflicted with heel bruises, while the latter invariably slide forward after the front feet strike the earth. The heel-spanker needs more action for the flexors, while the sliding-footed trotter requires less action for the flexors. If the hoof of the hard heel-striker is permitted to grow out at the toe to the full margin of the wall, and it is sharply lowered at the heels, and then provided with a shoe drawn thin gradually from the quarters to the heels, he will cease to strike the heels violently and the bruises will disappear. If the toe of the slider is foreshortened and the shoe is drawn gradually thinner from the heel to the toe, the sliding will cease and much lost motion will thus be avoided. These precautions remedy the defect of muscles. Comparatively short muscles of the forearm are like the string of a short bow in archery—they work quickly, with a correspondingly limited sweep. There are three methods of measurably remedying this defect, and they all can be summarized in the instruction to properly work

Digitized by Google

the levers that regulate the action. These levers of locomotion are the extremities comprising the head, neck and feet. If the action should be longer and lower, the first means of accomplishing this result is to draw down the head and neck by means of the standing martingale. This operation will impose a special burden upon the anterior extremities by bringing the center of gravity farther forward. Every trotting horse that has the low, gliding, daisy-cutting forward motion that distinguished Lady Thorne, carries the head either out almost in a straight line with the body or only elevated to a slight degree. On the contrary, every trotter with a short, high, bold, lofty knee action carries his head aloft like the primitive Morgans, and consequently loses speed by the excess of altitude of his forward movement. From these two types of trotters, without reference to physiological reasoning, the conclusion must be reached that lowering the head and neck will have a direct influence in lowering and extending the front action. Then the heels must be lowered and the toes permitted to extend to the full margin of the wall. This will increase the ground surface of the foot. An increase of the ground surface means a longer leverage for the muscles of locomotion to overcome, which necessarily decreases the elevation of the action and insures its greater forward extension. The practical demonstration of this twofold result is manifest from the well-known fact that scientific trainers of the trotting horse have long since learned that extended toes invariably insure a greater length of stride, while no remedy so effectually prevents arm-cutting as that of lowering the heel and of extending the toe. When the heels of the hoof are abnormally low, and the horse still strikes his arms, the skillful smith simply draws down the heels of the shoe to the thinness of a knife blade, and the arm-cutting usually ceases.

The last element of this remedial shoeing is in the lightness of the plate. This may be carried to the extreme limit that does not interfere with balanced action. The prevalent notion that the web of the shoe should be thick and stiff enough to dissipate the concussion finds its contradiction in the fact that the iron plate increases the friction and therefore intensifies instead of diminishes the concussion.

Nothing will give to the forward stroke a long, low, gliding movement like a thin shoe drawn down to a feather edge at the heels. If the horse can withstand exposed heels, by reason of strong quarters and stout heels, strengthened by prominent, broad bars, then tips are to be preferred to all other forms of shoes. But the hoofs must be gradually indurated by long jogging in tips before the horse is speeded. Rapid work as soon as tips are at first applied means sudden soreness, and sudden soreness produces a short, tender, groggy, trotting step, frequently changing into a rack or the pace. For it should be remembered that the primitive method in the saddle-horse regions of changing the trot into a rack or pace, was to heavily arm the hind feet and then to ride the horse with bare heels in front over the hard turnpikes till he became sore forward and stepped more tenderly in front, with continued exercise, until the pain forced him to change into the saddle gaits. But if the bared heels in tips are gradually hardened and accustomed to the unusual pressure by a winter's jogging, they will be enabled to withstand extreme speed without resultant soreness.

When thus equipped the merest amateur will be amazed at the radical change in the forward action. Having seen the lofty, skyward ambition of the bold knee-action trotter thus changed into the low, gliding sweep of the line trotter, no one who has witnessed the morning exercise of such a horse in tips can refrain from exclaiming in wonderment, "See how completely he has changed his gait!" The tips should be exceedingly light, not weighing more than three ounces, and drawn out long, reaching to within three-quarters of an inch of the inflection of the wall at the beginning of the bars. This extended length will prevent any danger of soreness, while it will insure a greater sweep to the stride. Then, to compensate for this change of gait and to prevent either forging or speedy cutting by reason of the lengthening and retarding of the forward articulation, the hind feet should be provided with ex-

ceedingly light shoes, weighing not more than four ounces, extended beyond the heels and provided with slight heel calkins to act as checks to shorten the hind strike on landing. Thus provided, this splendid son of George Wilkes may rapidly increase his speed during the coming season.

It must not be overlooked that our correspondent says his horse "*toes out a* "*little in front*, but that his stroke is "straight, without twist of feet or limb." Here is another physical impossibility. Just precisely to the extent that the front feet "toe out" at rest do they "toe in" when uplifted in motion. This is as absolute as the alternate swing of the pendulum in motion. Defects of motion, by sidewise deflection inwardly, as in splay-foot, or outwardly, as in pigeon-toe, hinder and retard speed, because it is motion at variance with the straight line that is the shortest distance between two given points. This splay-foot tendency should be remedied by paring both branches of the front hoof to a mathematical level in accordance with the instructions given in the last number of the MONTHLY. If they are already level, then slightly lower the outside to compensate for any defect in the position or articulation of either the ankle or knee joint till the toes stand perfectly straight. Then the action will be straight at every articulation, unless the abnormal defect of the ankle or knee is so excessive and chronic that no remedial application can overcome its deformity in action. This defect has never been noticed in any inbred Hambletonian like the stallion under examination, but it is to be found in some of the Wilkes' branches that have crossed with the American Star matrons. Lady Dunn, the flea-bitten grey daughter of American Star, toed out so excessively in both front feet that no clamps or splints or bandages or surgical operations could ever have straightened her forward limbs. The defect was plainly located in her ankles. Their articulation, instead of being backward and forward in a straight line, was sharply outward. When seen coming down the avenue, up to her full speed, about two minutes and fifty seconds, she seemed to be moving in a straight line, but when jogging her front feet displayed outwardly like the disgruntled paddles of a wrecked windmill revolving out of line. This chronic defect, in her case, she transmitted to her daughter, Lady Bunker, by Mambrino Patchen, that afterward became the dam of the mighty Guy Wilkes. Whether that splendid son of a more splendid sire had any traces of this defect before he was taken to California the writer can not remember, but Joe Bunker, record 2:19¼, the best son of Lady Dunn, had the same deformity, by inheritance, to an intensified degree, if that could be possible. He, too, speeded with apparently straightforward action, and never brushed either ankles or knees. But this escape was not owing to his apparently correct forward action. All of the progeny of Lady Dunn, like himself, were exceedingly wide in the chest measurement. The fore limbs seemed to be fastened onto the outside instead of under the carcass. This peculiarity of conformation enabled them to swing their upturned front feet inwardly, both while jogging and speeding, without either ankle cuffing or knee-banging. The American Star cross, in a physical point of view, was not one of pure gold to the composite trotting horse of America. His ankles were not only awry but his knees were sadly sprung, so that to some of his daughters, like Lady Dunn, he bequeathed the curse of deformed ankles, and to some of his sons and grandsons on the dam's side, through his daughters, like the swift Startle, he transmitted his own weak knees, which bent over so feebly that they could not withstand the tremendous strain of preparation for active campaigning. Nothing in the entire range of farriery is so difficult to remedy, in swift action, as sprung knees and deformed ankles, both being distorted out of the line, which demands the greatest stamina consistent with the greatest speed and the least amount of interference. These defects forever precluded American Star from becoming the head of a great trotting family in the male line just as the weak feet of Bellefounder stopped him from perpetuating his remarkable trotting gifts except through his daughters. Farriery could not have wrought the desired transformation of

Digitized by Google

abnormal ankles and knees and feet into normal ones, even if it had, in their day, risen to the grade of the art which it now enjoys, but the Messenger blood has proven to be the magical alchemy that has changed, in the majority of instances, these defects into perfect limbs, and, at the same time, preserved the distinctive merits of both the American Star and Bellefounder strains in that marvelous alloy, the present perfected form of the American trotting horse. These illustrations of our subject fill the measure of our space, and the weight-bearing portions of the hoof must be reserved for another paper.

JUSTICE FOR THE PACERS.

BY L. E. CLEMENT.

FIFTEEN years ago I was employed in getting up legal papers and doing the office work of a New Hampshire law office, and my friends were surprised that my ambition did not lead me to be admitted to the bar of the state and live off the misfortunes of other people, instead of trusting my fortunes to the ups and downs of a small breeding farm. For twelve years I have been contributing my mite to the literature of the trotting turf. I have studied the records, not because I expected to be benefited directly by the sale of such horses as Arion, Allerton or Nancy Hanks, but to see what blood or habit of action, or development oftenest made successful race horses and sires.

Is it strange that, if trying to instruct my readers, my writing and my breeding have been in the same direction? Will S. T. H. kindly tell me what opportunities a non-standard sire has at present? Piloteer was made standard in 1890 by the performance of his get, where Prize entered the list. Rego was gelded young. Brook is not yet twelve years old, a gray, and consequently not in demand by progressive breeders. Buckeye Bayard is the oldest son of Bayard, that has sired a 2:30 trotter, and two of the four are out of pacing mares.

It will take more than sophistry to convince thinking men that the family of Bayard will not be greater than the family of his sire, Pilot, Jr. Bayard was nine years old when taken to New Hampshire, and by the advice of Mr. D. Swigert was sent to Maine, where he did nothing, and for two years was buried. The only thing he has to show for his Maine work is Emma B., 2 :22. At Woodburn he did very little, his wonderful half-brother, Tattler, having the call on account of color *and breeding*. Mr. Swigert directed the breeding of that noted farm and advised Mr. Wetherbee *to send Bayard to Maine and use Eagle Mambrino himself*.

So Bayard had fifteen years of active service in the stud, interrupted by a failure of the parties who had him at Springfield, Ohio; made several successful seasons at New Burlington, Ohio—was returned to Alstead, N. H.; thence back to Mt. Union, Ohio, where the last two years of his life were passed in darkness, the cruelty of man having destroyed his sight. Such is the history of the greatest son of Pilot, Jr., and he has left sons that will be greater than he was.

I was not surprised to see in the article of S. T. H., in the February number, Prompter, the youngest of the trio of sons of Blue Bull, that have sired more than one 2:30 trotter, was foaled in 1875. "*So that they are all over seventeen years old, and none of them have a producing son.*" Yet Prompter sired Apex, 2:26, sire of Dot, 2:29¼, and Creole, 2:20, six years old, sire of Joe S., 2:30. *So Prompter has two producing sons* at seventeen years of age, and three trotters and one pacer in the list. I understand that Prompter will be returned to Indiana for the season of 1892.

The readers of the MONTHLY will not fail to remember that it is but few years since any seventeen-year-old horse had sons and daughters in the list, and both sons and daughters in the lists of producers, as has Prompter. S. T. H. asserts that the Blue Bulls are knee-bangers and toe-weight trotters. I do not know about the knee-banging part. Yet the Blue Bulls that I know trot without

weights or boots and do not need them. When S. T. H. states, as he did in his first article, that as performers "they are never first-class," I must doubt his honesty when he says in his last article, "His sole object is to advance the trotting interests of America without fear or favor." I write what I find in the records, and I sometimes write to get partial justice done to an old pacing horse, dead, lo, these many years, but still lied about from Maine to California, and when not flatly lied about slurred at as a sire of colts that did not receive from him the prepotency to transmit the good qualities inherited from him. Does it weaken the effect of my writing that I am putting my time and money into this blood that is so antagonized by the owners of and writers on the more fashionable blood lines? At one time Volunteer was the pet son of the great Hambletonian, and last year Volunteer's most successful son was Kentucky Volunteer out of Kentucky Girl, by Blue Bull, a mare that paced in three minutes and was a successful trotter in hobbles.

The winner of the yearling stakes at Springfield, Ill., in 1892, was by a son of Fairy Gift, whose dam was by Blue Bull.

The best campaigner of his age out of a mare of unknown breeding is Senator Conkling, 2:16½, by Roscoe Conkling, whose dam is Bertie, by Blue Bull.

S. T. H. is as well aware as anyone else that breeders are not using the sons of Blue Bull or Hiatoga or Tom Hal, on their best standard mares, *and they must, as they have made their success on the inferior mares like the saddle-mare dam of Gipsey Queen*, 2:19½, by Rushville, *and Nettie*, 2:19, out of a mare by Col. Elsworth, a horse that never sired but one 2:30 trotter.

The blind horse Roger Hanson, now nineteen years old, is the sire of two 2:30 trotters, one out of a mare by Blue Bull and one out of a mare by his son, Blue Vein. Is a comparison of the results in the stud of Blue Bull's sons on common mares with the sons of George Wilkes a fair comparison as to the prepotency or power to transmit of the two horses? Blue Bull has sons that will have more in the list than he has himself. Grove's Blue Bull, Little Henry and Blue Bull, Jr., will furnish many a stake winner for New York and New England.

Blue Bull blood with any opportunity is breeding on and bringing better relative prices than ever before.

In closing up the long article of S. T. H. on "The Pacer's Contribution," he alludes to the fact that Count Valensin had the wisdom to sell the son of a blind horse and keep the wonderful pacing sire Sidney, the sire of the fastest yearling trotter and the fastest yearling pacer, and the fastest yearling having a record at both gaits, and then goes on to say: "It seems that Sidney will set the thinking minds of the progressive breeders to consider this suggestion, new as pure gold from the mint." Has S. T. H. been asleep and dreaming the passing time away that he has taken no note of Hermit, pacing son of Harold, whose daughter holds the New England record for two-year-old trotters? Nor Happy Russell, 2:22½ *pacing* sire of the wonderful trotters Happy Bee and Happy Lady? Nor Wilkie Russell, sire of Primus, 2:29; both the record of Happy Bee, 2:29¾, and Primus made when their respective *sires were only five years of age*, and Allie Russell, the sire of a two-year-old trotter with stamina to win a seven-heat race from aged horses? Nor Creole, 2:20 pacing son of Prompter, sire of Joe S., 2:30, and himself foaled in 1885? Sidney is not an exception; the pacing gait does not like blindness breed on with certainty. It is useless to cry stop thief because we are getting in more and better pacing blood, and hold our peace when such blood as Epaulet, Lyle Wilkes, Simmons and Roger Hanson is offered.

If S. T. H. is the philanthropist he claims to be, let him not fling mud at the blood that has done so much, but write down the unsound sires wherever they are. The family of Bayard, Blue Bull, Smuggler, Pocahontas and Tom Hal, as sires of prepotent descendants, will go on increasing in volume and be greater with each succeeding generation, and the pacing sons of Mambrino Russell will have longer 2:30 lists than any horse has yet been able to leave. I am willing the readers of the MONTHLY shall be the judges of who is doing most

Digitized by Google

for the trotting turf. I, who am interested financially in seeing the blood of Blue Bull get full and just award of merit, or S. T. H., whose "sole object is to advance the trotting interests of America," and tickle the vanity of the wealthy owners of blind sires and straddle the fence with well-turned sentences, advising the breeders to breed to horses of strong Messenger breeding and from mares of the same lines.

HIPPOPHAGY.

BY R. C. A.

THE evidence lately afforded the world that horseflesh has been sold, and necessarily consumed, as food—which only shows, however, the cosmopolitan character of this city—has led us into an inquiry in regard to horseflesh as an article of diet. Though its sale is certainly against the law, and against the stomachs of the lieges, the question has suggested itself: Should not horse-eating be made tolerable? Our inquiry into the matter has established the fact that hippophagy (*hippo*—horse, *phagein*—to eat), is a highly respectable and ancient custom.

The records of the past, indeed, afford copious evidence of the fact of the regard the ancient races, from whom we ourselves descend, had for the flesh of the horse and his cousin, the ass. The latter has always been esteemed; it has, in truth, "had the call." Who ever saw a dead ass? Commencing at an early period of history we find that great hippologist, Xenophon, has informed posterity that the army of Cyrus, when on the march through Mesopotamia, caught a number of wild asses whose flesh the soldiers found to very much resemble that of the red deer, only that it was far more tender. In Persia the horse was common food. The wild ass was also highly prized, not alone as an object of the chase—it was extremely fleet footed—but for the exceeding delicacy of the flesh. So much was this the case that it was on such account made a luxury at the royal table.

Gibbon describes the ancient Scythians—who had so much to do with the populating of Europe—as devoted in their liking for horseflesh. "They devour it with peculiar greediness," he tells us. T. W. Atkinson, who traveled very extensively in Siberia, speaking of the Kirghis and their neighbors, says of them: "The Kirghis consider the flesh of the wild horse the greatest delicacy the steppe affords." The Kirghis are of the same blood as the Scythians. To the Tartar, Kirghis or Kalmuck gormands, the flesh of the horse served up boiled, broiled or smoked forms the most delicate morsels that could tempt them. Mutton was also served at every dinner; but beef was rarely eaten; only hunger could ever induce them to partake of it. When they were on an expedition they cooked it as the Huns do their beefsteaks. They placed the juicy slice between the saddle and the back of the horse which they bestrode. There it remained as a sort of saddle-cloth till it was sufficiently done, when they removed it and ate it with the relish of satisfaction secured by a short respite from danger, and also by the gamey flavor of the meat. This most dainty diet was washed down with liberal draughts of mare's milk, which in a fermented condition and brewed into an intoxicating drink, known as koumis, was the national drink of all these western peoples. The nomadic peoples of northern Asia still retain their early predlictions for horseflesh. It has always been their favorite dish, though they were rich in flocks and herds. True the more barbarian the tribe the greater horse-eaters they were. They had the idea strong in them—which lingers till the present hour—that to be strong and fierce in war they had to eat strong meats of fierce animals. The horseflesh they ate was derived from the chase. Horse-eating is practiced among the Mongols even till now. The Buddhist priests have exerted themselves continually to eradicate the custom, but we see it still lingering in out-of-the-way places.

Our ancestors in Europe who inhabited these sepulchral caverns and pile-

Digitized by Google

dwellings were nomadic hunters, subsisting on the products of the chase, and as yet possessed no domestic animal except latterly the dog. The horse then roamed wild over Europe. It was the great object of the chase of those early people; it formed their staple food. In one cave the remains of the horse formed a deposit of 10 feet in depth, and more than 300 feet in length. This pile represented the accumulated remains of from 20,000 to 40,000 of the diminutive horses of those times. It has been proved to us by archæologists that these horses have formed the chief food of palæolithic man.

Coming down to later times and to closer blood-relations, we find that the Scandinavians and Germans, worshipers of Odin, reared and kept pastured in sacred precincts a rare race of pure white horses. These were destined to be immolated on the altar of the gods they adored. The sacrifice ended, they boiled the flesh and feasted on it. The people among whom the sacred flesh was distributed had thus the assurance of real fellowship with the gods. It thus apparently served a similar purpose as the sacramental wine of the Christian. The songs and sagas of the north, as largely discovered in Iceland, are full of details of these feasts to Odin; in which the sacred horse and its flesh-consuming occupy a prominent place.

These proclivities for the meat of the horse prevailed till even after the introduction and acceptance of Christianity by these peoples of the north. The practice was hateful to the propagators of the new religion. Popes had to prohibit the use of horseflesh. In a letter in the eighth century by Gregory III to St. Boniface, archbishop of Mayenne, the Pope wrote, on receiving information on the matter: "Do not allow it to occur for the future. Abolish the custom by every means in your power and impose heavy penances on all horse-eaters. They are unclean, and their acts are execrable." Pope Zechariah, successor to the great Gregory, renewed the prohibition. Among the benedictions of Monk Ekkehard, of St. Gallen (about 1000 A. D.), to be pronounced over the meats in the refectory of that monastery, one refers to the flesh of wild horses, which must therefore have been among the delicacies of the times.

The habit remained common for many centuries after in Scandinavia. Indeed the race of white horses, sacred to the custom, has never become extinct. A return to the eating of horseflesh would not, in these enlightened days, be considered as a latent tendency of a return to the worship of Odin. Though we have for over eighteen hundred years had no knowledge of Odin we still retain, as a legacy of that worship, the names of certain days of the week. If ever horseflesh eating becomes tolerated again it would not be inappropriate to make it peculiar to one of these days!

Early Britain we know was peopled by descendants of these Scythian, German and Scandinavian races. Hence we might expect to find traces of horse-eating habits among the ancestors of the modern beef-eating Briton. And we do. We find that the Danish inhabitants of Northumberland were fond of their horse-flesh pots. They devoured the meat in great quantities. This was a source of anxiety to the fathers of the church of those days. St. Egbert, the friend of the venerable Bede, tolerated it. "I do not forbid it, although many families object to it," he said. But later saints set their faces determinedly against the pagan custom. In the eighth century the Council of Culcheth, in Lancashire, prohibited the eating of horses "because it is a thing done by no eastern Christians."

With the supremacy of the Anglo-Saxon in Britain the custom rapidly died out. The Anglo-Saxon seems to have been always prejudiced against it. And today—though we give an instance further on of a Briton voluntarily admitting having eaten it— no epithet is so scathing in its derisive denunciation of a poor quality of beef among the Jack tars of the navies of the tight little isle than to refer to it as "horse beef." It is the superlative of contempt. In a similar way in some countries where its eating had been a sacred duty, the influences of Christianity had made such a reformation that no term of contempt was more resented than calling another a "horse-eater."

Digitized by Google

The flesh of the wild zebra appears to be excellent. Pinto, in his work on Africa, says: "I succeeded in killing a zebra, which supplied us with excellent meat, a good deal better than that of any antelope." The meat of the quagga is not so dainty. According to Harris, "By the roving clans of Bichuana huntsmen and the voracious bushmen hordes its disgusting oily, yellow flesh is esteemed a delicacy." But other authorities do not speak so disparagingly of quagga flesh.

In modern times the patronage of the horse as a dietary resource is remarkably large. It is so, not only from necessity, but choice. In Sweden the habit was rather common than not. The wealthy would eat a piece of salted horseflesh, washing it down with a glass of wine, before meals, as an appetizer. The meat has been regularly on sale in Denmark and Sweden.

During the siege of Copenhagen, 1807, the Danish government authorized the sale of horses in the butcheries. Since then they have continued to supply the abattoirs. Berlin has had 637 shops for selling horseflesh, each animal slaughtered having the certificate of the veterinarian of the police. It shows a considerable increase during the past year. The Austrian government also authorizes the sale and consumption of the toothsome horse-steak.

But it is in France and among Frenchmen wherein and with whom the horse has become most endeared as the provider of a comestible having the real merit of rarity and novelty. Baron de Tott was one of the first noted Frenchmen to sing the praise of horseflesh. In his memoirs he relates that when he was being entertained in his capacity of envoy from the king of France, at the capital of Krim Gueray, khan of the Tartars, he partook at the khan's table of some excellent smoked ribs of horse, whose fine flavor excited his most exuberantly expressed admiration and delight.

In the campaigns of the Rhine, Catalonia, and the Maritime Alps, Baron Larrey, the celebrated army surgeon, resorted to horseflesh to strengthen the wounded soldiers. It was a chief means, in his efforts to save the soldiers. He was always free to affirm that he had "employed it with the greatest success." He continued its use in other campaigns with the same excellent results.

M. Huzard, Senior, the celebrated veterinarian, is recorded as saying that, during the revolution of the eighteenth century, when for six months Paris was fed on horses, the public health was unaffected by such diet.

In 1811, at the request of the Paris police, several of the very highest authorities in the country certified that "horseflesh is very well flavored; is very nutritious, like the flesh of other animals; and that those who have regularly fed on it are as healthy as can be desired." Hence they requested that its sale and use should be tolerated.

Several of the greatest scientists of Paris, at the head of whom may be placed M. Geoffroy St. Hilaire, the noted naturalist, were persistent in their recommendation of the horse as a source of food. Mainly owing to this named savant's continued striving with and combating the national prejudice, the sale of horseflesh at last became legalized. It was regularly sold in the butcher shops. Parent Duchatelet said that the knackers who lived on it had a remarkably robust and healthy appearance.

A *Societe Hippophage* was organized in Paris, and the result was that frequent banquets became the vogue, under its auspices, where the *piece de resistance* was horse. Such names as M. Quatrefages, who was its president, Lecoq, de Choiseuil, de Montalembert, Sanson, Letour, besides St. Hilaire, its apostle, and many others known to fame, were its ornaments. We have a fine report of these banquets that took place in Paris, in 1866, preserved in the files of the *Independence Belge*, on which we make a few notes. M. Quatrefages presided. After the banquet had been discussed, M. Decroix, the celebrated veterinarian, of Alfort, drew the curtain aside a little and said:

"All the horses whose flesh has been eaten at this banquet were old and miserably (!) thin beasts, from fourteen to eighteen years old, and none costing more than 40 francs and one as little as 18 francs." Immense applause followed this statement, which showed the

Digitized by Google

heroic determination of the Parisian stomachs when influenced by enthusiasm. The only reflection and regret was that such being the meat of old horses, how much more acceptable would young "cattle" have been. M. Homon, of the *Pays*, put in a claim for the ass and mule. M. Georges Bell, of the *Presse*, remarked that horseflesh was no novelty. M. Bouilley, another famous veterinarian, who had sat down full of what he afterward termed "an obsolete feeling of repulsion," rose (to the occasion) with "explosions of satisfaction." Skeptics were converted. Gourmands were not till then aware of the excellence of a fillet of horse.

The following is a *menu* of one of these banquets:

POTAGE
Vermicelli with a consommé of Horse.
HORS D'ŒUVRE.
Sardines, Anchovies, Olives, Fresh Butter and Red Radishes, Tunny from Holland, Saucissons de Lyons.
RELEVES.
Fresh Salmon, Sauce Hollandaise, Rump Piece (Horse) garnished with Brussell's Sprouts, Horse à la mode.
ENTRES.
Hash of Horse a la ménagère, Chicken, sauce supreme; Sorbets mousseux au Kirschwasser.
RÔTS.
Tenderloin of Horse served with sherry wine sauce, Salad of Cos Lettuce ornamented, Pate of Horse Liver and Truffles.
ENTREMETS.
Green Peas à la Francais, Apricots à la Portugaise, Glace au capi.
DESERT.
Cakes and Fruits.
WINES.
Madeira, Bordeaux, Sauterne, Beaume, Champagne, Black Coffee and Cognac.

In another "bill" among the entres were: Horse tongue a l'écarlete, Horse liver a l'Italiene, Horse brains fried in butter and lard, Cervalas of Horseflesh and truffles, etc.

In the above *menu*, where we have placed a star, it was remarked that "no joke was meant." To a speaker of the English language the French supplies a rich store for such perpetrations. But all such being *hors de propos*, etc., we refrain. One criticism seems to occur to us: Why was, among "wines," Koumis omitted, which was a fermented "drink" so intimately connected with the animal they were gathered to honor? The whole affair seems to us to have been an occasion on which the votatile Frenchman exhibited rather *unbridled* appetites.

The first shop that had been opened in Paris—on July 9, 1866—was quickly followed by others. M. Decroix declared that the horse sausages were particularly appreciated; forgetting, we fear, that these were but old friends under a new name. The *saucissons de Lyons* were, notoriously, manufactured from the flesh of the horse and the ass. During the last half of 1866 there were consumed, in Paris, 902 horses. In 1867 the number rose to 2,152; in 1868 to 2,421; in 1869 to 2,758; in 1870 to 3,791. Then came the siege of Paris. During the last three months of 1871 the number of horses slaughtered for food was 29,214, and in January, 1871, the number was 10,123. These were consumed by the Parisians alone. Besides the above the army used 15,000 more; and there were also used outside and around the city large numbers. Altogether the siege was responsible for the slaughter and consumption of 70,000 horses.

Parent Duchâtelet declared that the consumption of horse meat "had become a necessity." But though there may be many Parisian epicures who prefer horse to beef, yet the habit can not be said to have overcome the natural prejudice. The French as a nation are not as heavy meat eaters as the English. Anyhow, considering the close connection between France and Rome, and the action of the early popes, it shows how dead the Mosaic law has become, and that the church could tolerate such a practice shows the little foundation there is for the only reason—stomach prejudice—that restrains people from utilizing the horse to-day. As geology proves, the horse was originally cloven-footed. The animal seems not to have been known to the Israelites, for it is not included among the domestic animals we were not to covet. An attempt was made by arranging a similar banquet to tickle the palate of John Bull with horseflesh served up *a la Francais*. But banquets were too sacred to the Britisher to be utilized for such an apotheosis of his dearly loved equine friend. The mere fact that the

Digitized by Google

horse is not an animal to be eaten, seems to us to be one of the great charms surrounding the faithful one. There is the record, however, of one English gentleman who was not afraid to own to having eaten horseflesh. Dr. Humphrey Sandwich, of Kars, was electioneering in Marylebone and was accused of not being a working-man. "I don't know what you call a working-man," replied the doctor breezily, "but I have worked hard all my life, I have groomed my own horse, and what's more, I ate him afterward." The selling of horse-flesh for human consumption in London has been legalized since 1889.

As to the *taste* of horseflesh, it is said to resemble good beef with a sweetish flavor. It is palatable and gamey. On the authority of Liebig, whom we have learned to believe, we know that, being so highly azotized, it is very nutritious—even more so than beef or mutton. Age, we have seen, as well as other things that would deleteriously affect beef, detract not from its culinary value. M. Decroix has declared he would eat the flesh of a glandered horse as readily as that of the healthiest!

That it has been unconsciously—more frequently than we are aware of, in fact—eaten by most of us, shows that it can not be distinguished after cooking from good beef or mutton. Horse tongues pickled are a very common and frequent substitute for the linguals of reindeer, and even other ruminants. The housekeeper can easily guard herself against such deception by examining the shape and color of the tongue she is purchasing. The horse's tongue is straighter, flatter, *whiter*, and (the easiest test) not rough on the upper surface.

It has been remarked by travelers who have observed the horse-eating habit in the natives of certain uncivilized tribes to-day, that these people emit a peculiar odor, so that no white person can stay near them. The same can be said with equal truth of the horsey stable-boy, he smells more of the horse than the horse himself.

It would seem that the reason that horseflesh is tabooed to-day is simply from "prejudice." That is all. But in how many and diverse ways do we not offend against the Scriptural rules!

The horse is the cleanest of all graminivorous animals, still he is called "unclean." He subsists, it may be said, entirely, on the grass order of the vegetable kingdom. Hence he is free from unwholesomeness. He is freer from contagious diseases than the ox, the sheep, or the hog. The tolerating the sale of horseflesh under proper inspection, for food, might prove a happy release—a happy euthanasia—for the equine toiler. It would certainly prevent many a misery, many an ill. On that account we might consider the humanity of the inclusion of the horse among our food-contributing animals.

EXAMINATION FOR SOUNDNESS.—(Continued.)

BY R. S. HUIDEKOPER, M. D., VETERINARIAN.

Specific Work.—Speed at trotting, pacing or running, etc.—A horse is frequently sold subject to a guarantee that it can show a certain speed—a given distance in a certain time. In this case the responsibility of showing the horse lies entirely with the seller, the question of accurate distance and timing being mutually agreed upon by both parties. In other cases, the examiner has to determine that the horse is legitimately what it is represented to be, as to gait. A trotter should not only show a fair square trot up to the limit of its speed, when driven by the seller, but should do the same when driven by any fair driver. If the animal shows an irregular gait when driven by the purchaser, changing to a pace or breaking into a run, the seller, if he considers the purchaser incompetent to handle the horse, has a right to demand a trial and decision by other drivers or riders. The same rule holds for pacing, single foot, etc. In running, hardly any question can arise except as to speed.

Saddle horses should have good manners with any fair rider. The question

Digitized by Google

of special gaits is to be governed as in the case of trotting, etc. A saddle horse must be quiet to mount, bridle-wise, free from vicious rearing, plunging, bucking and kicking, and while the hardness of mouth may be variable, the animal must not be a runaway. The conditions of manners are even more imperative and rigid for a *lady's saddle* horse than for others.

Hunters.—A "green" hunter is bought, according to the weight which it is expected to carry, upon its size, shape, and conformation, being suitable to the work for which it is intended. A "made" hunter must carry the weight it is fitted for, when ridden by the seller or a fair rider over ordinary obstacles, timber, stone walls and water, with energy and without attempting to escape from control of the rider or balking. The general rules for saddle horses apply to hunters.

Harness Horses.—Horses sold as "kind in harness," whether double or single, must be quiet to harness, and while being hitched to any vehicle; they must start willingly, with no evidence of vicious rearing or plunging (consideration must always be given and allowance made for "green" horses and those that have been standing without use for some days, but rigid judgment must be made between them and those of intentional viciousness). They must neither balk, nor jibb nor kick during any part of the drive, but the best of horses may do these for the first time if a too severe curb bit, a tight collar, or a badly fitting part of harness causing pain, has been used. The horse must be willing to go over ordinary highways and pass usual and ordinary objects in a quiet manner, with no evidence of a desire to get beyond the control of the driver. Here again consideration must be made for green horses and those which have been stabled without work.

Draught Horses.—For heavy work, cart horses, brewers' horses and those employed in the great industries, weight of the animal itself is an important essential in addition to the proper conformation of the animal. A still more important factor is the nerve force, energy and willingness of the animal. A draught horse needs intelligence and a gentle disposition. It must not only draw heavy loads without balking and jibbing, but must be able and willing to start the loads, and to draw them up hills, starting quietly after the necessary rests. A nervous horse often becomes irritable when asked to do excessive work, and if roughly handled is *made* balky. In the horse market at Paris, France, there is a steep artificial hill the height of a three-story house, over which draught horses are driven drawing a cart with the wheels locked to test them for pulling and for wind.

Qualities of Safety.—Steam, noise, shying ,etc. The examination of a horse for safety is a most unsatisfactory task, and the result of a decision is, in a great degree, a matter of opinion. The horse varies as much in its psychological character as human beings do, and is as dependent upon other beings around it for moral support, as they are. The horse knows at once whether the rider or driver is the one accustomed to handle him, or whether it is a stranger; he recognizes instantly when any moment for quick decision arrives, whether his conductor will guide and control him, or whether he is left to his own judgment, and when he has been accustomed to obey a firm hand, a timid one may destroy all the confidence he has in himself.

Qualities of safety, like those of specific work, are variable, to a great degree, according to the manner in which an animal is handled. Some horses are perfectly safe in the hands of a good driver, and may become unmanageable under the guidance of others. It is remarkable how horses in the country find objects to attract their attention and frighten them, which they pass unnoticed in a large city. The same horse, which in a country village would start and snort at a railway train a half mile away, will, in a large city, pass a fire-engine under steam, and drive under an elevated railroad with a train screeching over its head, with absolute unconcern. Horses certainly understand perfectly when they are managed by a resolute driver who expects to control them, and when they are under the guidance of a coward, whose lack of confidence they promptly share.

Digitized by Google

Again, a horse that has been standing for some time in the stable will notice many things which it would not if it had been driven daily; a horse on a cold, crisp day, will, like a man, show the invigorating effects of the weather, and prance and play, as it would not in warmer weather; a mare at certain periods, during rut, will be nervous, shy, plunge, and kick, while she may be absolutely quiet at other times. A close study must sometimes be made in order to determine if any evidence of restiveness or unsafe actions on the part of a horse are due to accidental, explicable causes, or are the results of confirmed bad habits or actual vice. Naturally, the driver of a newly purchased horse objects to acknowledging that incompetency or carelessness on his part has been the cause of an accident, and on the other hand, there always rests a strong suspicion that the seller of a horse, which shows a vice, was aware of its habits before getting rid of it. More than a fair driver, an expert horseman, may be tasked to decide upon such questions.

Shying.—Undoubtedly many horses shy on account of defective vision, near-sightedness, opacity of the lens, or humors of the eye, blindness of one eye, etc., which do not allow it to see objects clearly, or which bring objects suddenly into view in close proximity, and threaten contact, before their exact nature can be appreciated. Young and green horses may shy at objects to which they are unaccustomed, to which they will pay no attention later. Any horse may shy at an object which comes suddenly in its close neighborhood and threatens to strike it. Some horses will shy at certain things or places associating them with some previous accident, injury or punishment. Timid horses will often shy when alone, while when driven double, or in company with others, they are perfectly fearless. But whether shying comes from playfulness, cowardice, defective sight, or other cause, it is frequently made much worse, more dangerous and incurable, by the evil habit of some drivers of roughly punishing and whipping the animal for it. This promptly associates in the horse's mind a fear of punishment with the object to be shyed at, and the act is more sudden and violent, whereas a quiet, encouraging word, or a judicious, firm guidance of the horse would have cured it.

Restiveness.—A green horse may be restive when harnessed or when obliged to stand during a drive, but then, must be considered as not broken to harness. Any horse may be excusably restive if it has been standing for some days without use, but in this case the *onus* lies upon the seller, and a bargain should not be consummated until several days' trial has shown the truth of the explanation. A badly fitting harness, causing pain, may cause a horse to be uneasy. The best of horses may be unusually gay, fretful, or even restive in very cold weather, when hungry, and kept away from their stables, or when surrounded by the excitement and unusual sights and sounds of a public holiday.

Rearing.—A rough hand, a severe curb bit and bad hitching may cause any horse to rear by accident; but most cases of rearing are due to absolutely bad disposition, and condemn a horse as not kind.

Kicking.—The fault of kicking may be confined to the stable, or may occur in harness. In the stable it is an annoying habit, as it not only worries the other horses, but wearies the subject of it. It causes injury to the posts and partitions of the stall, and risks injury to the horse itself. It is a habit difficult to cure when confirmed, and though chains, straps or other attachments to the legs or removal to a box stall *may* stop it, yet, these require an expenditure of time, trouble or money, and detract from the sound value of the horse. Kicking in harness is an absolute vice. Though it may have occurred but once, and then due to an accident of an unfastened harness, or a broken wagon, yet, if a horse has once kicked, it will kick again, sooner or later, and with or without provocation.

Running Away.—Running away, like kicking, becomes easily a confirmed vice. When a horse has once learned its power, and has been master of its driver, it has passed from the class of "kind in harness." Of course many a runaway has been driven afterward, and has proved a satisfactory good horse, and a good

Digitized by Google

driver, if a man can take risks for himself with such an animal, but the animal's value is depreciated when it comes upon the market, and the seller, knowing the the horse to have run away — once only — is responsible for future damages, if he has not declared the vice of the horse at the time of sale.

ONE TROTTING HORSE BREEDER'S VIEWS.

EDITOR OF THE MONTHLY:

WALLACE'S MONTHLY, the organ of the American Trotting Register Association, in its issue for January in "explanation" of the action of the board of directors in admitting the pacer to standard rank, refers to all protests heretofore published against said action and the holding of the board responsible therefor, as "capticious criticism based entirely on lack of information, (criticism) projected in ignorance and maintained in stubbornness." It furthermore says: "At the Chicago convention of last April the pacer was *enthusiastically* welcomed into fellowship with the trotter, and the charter of the Register Association was drawn by order of the convention with the express purpose of covering the *two breeds* of horses, the language of that document being 'to improve the breeding and value of the American trotting and pacing-bred horse and to advance the interest of the breeders thereof in all possible ways.' The directors, therefore, had at their first meeting nothing to do with the admission of the pacer *into the Register*. The breeders of the trotting horse had settled that point; the only discretionary power left to the directors was to fix the basis of admission. This they did in a way which it is believed is satisfactory to a large majority of the breeders of the country, if the sentiments expressed *at the Chicago convention* are any index of what those gentlemen wanted." (The italics are mine. W. P.).

Why in all "fairness and honesty," (to use the editor's words) did this writer not quote the *whole* object of the Association as *expressed in the charter*? If that gentleman or any other will refer thereto, he will find that it provides *not* for the publication of *a* or *the* register, but for the "maintenance of *registerS* of trotting and pacing-bred horses." The convention, like the editor, recognized the "*two breeds*" and intended to provide *a* register for *each*. It did not and could not expect any other interpretation to be put on the language used in the charter, any more than Mr. Colman, when he advocated providing for the *registration* of the *saddle horse* by the Association, expected or desired "the coupling of the *three breeds* for the benign influence they would have on each other." Had the convention so understood Mr. Colman's proposition, he would have raised a storm at that meeting. No destroyer of the "trotting standard" would have been for one instant tolerated *in the convention;* why then should this destruction be submitted to because done by the board of directors?

It was not only the right, but the duty of the board of directors to (as the chairman of the committee on by-laws put it) "provide for the registration of pacers," and under article III, section 3, it has the power to adopt rules governing the *pacing* standard, for none then existed; but whence, I ask, did that board get its authority to utterly ignore, to *wipe out of existence* the "breed of Standard Trotters," and in its place to "establish a BREED of trotters AND pacers?"

Now, I don't want for an answer the assertion that some trotters or most trotters sire pacers, nor that some pacers get almost nothing but trotters. I know such to be a fact, and I also know about the trotting-bred Direct having paced in 2:06. I know all that, but there is a great deal more that I don't know. What I don't know is just what interests me most just now. I don't know where the board got the authority I have above referred to; neither can I so much as find its authority to register trotters and pacers in *one* register, nor under *one* standard.

It is not in the charter! It is not in the by-laws! Nor can a man quote a sentence spoken or that can be interpreted, to that effect, by anybody at the convention!

Digitized by Google

Why, even the board of directors, when it amended by-law II, provided for "establishing rules governing the standardS!" Why standardS, if *one* standard was to be sufficient for two breeds? And if for two, then ample for three?

The breeders of the pacing-bred horse were not invited to attend the Chicago convention. The convention was called as a convention of trotting-horse breeders; it met as such; it organized as such and it adjourned as such!

The trotting-horse breeders present, had therefore recognized the trotting standard, and the Wallace Trotting Register. At that convention, they concluded and agreed to purchase that register, and all of its rights; among the latter, that of registering trotting horses under the then existing "standard."

Did any man there or then, express any dissatisfaction with that "standard?" Did anybody ask or intimate that that "standard" should be altered or changed in any way whatsoever? Did anybody ask to have *more* breeds admitted under the *standard?*

Not a soul! The great and only factor that brought together all of those "trotting-horse" breeders, was the desire to get into their own hands and to control the "Trotting Register," in other words, the evidence, the published *proof*, of the great work done by them and their predecessors sors in building up, in establishing most useful BREED of horses, the "American Standard Trotter;" it was to acquire and so to secure beyond a peradventure, that *register of past evidence* and so to control the requirements entitling the *future* evidence to registration of all standard trotters. That the death, the dishonesty, the caprice of no single individual, or of no dozen individuals should or could jeopardize the immense and invaluable interests involved in that BREED of Standard TROTTERS!

Who knows aught of "that BREED" now? The board of directors has decreed that it shall no longer exist, and in order to give that board the color of authority for its action, the organ of the American Trotting Register Association, (WALLACE'S MONTHLY) uses the following language:

"There has been in some quarters of "late a disposition to criticise the ac- "tion of the *Breeders' Convention* in this "city last spring because *it* admitted to "*standard* rank, all pacers acquiring a "record of 2:25 or better," and again

"As far as admission of the pacer to "the *standard* is concerned, it seems "illogical and prejudiced to assert that "when the *Breeders' Convention* gave "the pacer standard rank, * * * "that body of men perpetrated an in- "justice. The question was fully dis- "cussed at the convention. In view of "these FACTS, the present effort to en- "gender strife on this point is entirely "out of place."

Now, Mr. Editor, what were the facts? Surely not what is above stated, because the proposition to admit to "standard rank, all pacers acquiring a record of 2:25 or better," was *never made at that convention.* If the proposition as stated, was not made, it could not "have been fully discussed." Is that not so?

What *were* the facts then? These, and if the stenographic report of the meeting as given by *Clark's Horse Review* be correct, *only* these:

(*a*) After concluding the reading of the report of the committee on organization (*i. e.* the by-laws,) its chairman, Mr. Campbell Brown said:

"I am instructed also by this commit- "tee to say that the question of the "*registration* of pacers was brought up "and that a majority of the committee "*seemed* to be in favor of their registra- "tion, or rather, in favor of *providing* "*for their registration.*"

Are these words to be interpreted as meaning that pacers were to be called trotters? or that *trotters* were to be done away with *as a breed*, in order to admit the pacer into a *new breed* to be established at the discretion of the board of directors?

(*b*) Mr. Allen's motion to amend the title of the organization by inserting the words "and pacing" is scarcely worth referring to, except that the objection to the long title drew from Mr. Colman, of Missouri, these significant words. "Of "course the pacer is *secondary to the* "*trotter.* * * * If we see proper to have "pacers *registered*, it can be done very "easily," and Mr. Allen replied thereto:

Digitized by Google

"I suggested the amendment for the "purpose of testing the sentiment of the "delegates present as to whether the "pacing horse should be recognized *in* "*the Register.*"

Surely Mr. Colman must be away behind the times when he so slights the pacer as to dub him "secondary to the trotter." Secondary indeed! and yet when this secondary consideration gets into the directors' ring, it knocks the "standard trotter" clean over the ropes; the directors call it "a draw," and *divide the purse!* Imagine a featherweight unexpectedly using a club just below John L.'s belt and the judges calling it a draw and declaring the little 'un John L.'s "peer!"

(c) On the last day of the convention, Mr. Allaire offered the following resolution:

"*Resolved*, That it is the sense of this "meeting that a board of directors of "this Association should take the neces- "sary steps to *incorporate the pacing in-* "*terest* under the control of this Associa- "tion, under a proper relative basis of "speed."

The motion was not seconded, Mr. Brodhead saying, "That has been covered by the articles of incorporation."

Again I ask,. Did Mr. Allaire mean, and did *the convention* interpret these words as signifying that pacers were to be called trotters, or that the *breed* of "standard trotters" was to be wiped out of existence in order to admit the pacer *under one and the same standard* as the *trotter* as a new "breed?"

Those, then, Mr. Editor. are the FACTS as to what was done at and by *the convention.*

The convention did *not* "fully discuss the question," and it did *not* "admit to standard rank all pacers acquiring a record of 2:25 or better." *It did not discuss the question at all.*

It simply and purely authorized the publication of a register for trotters, a register for pacers, and the adoption of such rules as would admit trotters and pacers to the *respective* registers to be published *under the control* of the American Trotting Association, *and nothing more.*

I do not think that *any* member of that convention, at that time interpreted the by-laws or the charter in any other way, and I am positive that Mr. Joseph Cairn Simpson, the representative from California, neither understood nor suspected that it was the desire or intention of the convention to relinquish the breed of "standard trotters," and in lieu thereof to "establish *a* breed of trotters and pacers." I certainly believe I know Mr. Simpson well enough to assert, had it been the sense, expressed or implied, of the convention to admit a "pacing bred and pacing sire of pacers" to registration *under* THE *standard* on account of the "benign influence," he was to exert on the breed of *trotters* that the gentlemen present, if they did not protest against the waste of time spent in discussing a subject extraneous to the purposes for which the convention was called, would have had the pleasure of listening to a vigorous, learned, eloquent and instructive disquisition on the still more "benign influence" of injecting large doses of "running foolishness" as believed in. and practiced by, the venerable delegate and others from California. Yet, I gravely doubt if even this "thoroughbred crank" would have suggested that the breeders should hereafter ignore and lay aside the one great object they have heretofore had in view, viz.: the establishment of a "breed of trotting horses on a firmer basis."

To come back to the action of the board of directors (for I presume that by this time, the editor of WALLACE'S MONTHLY will have come to the conclusion it was not the action of *the convention*), I would like to call that board's attention to the fact that the by-laws were adopted April 23, 1891, and that by that board by-law II was amended on May 19, 1891, whereas section 2 of by-law XII provides:

"Notice of *proposed* amendment to the "by-laws or alterations *of the rules*, shall "be furnished to the secretary at *least* "*thirty days* before the meeting at which "it is proposed to consider them, and the "secretary shall cause the *same* to be "*printed* and *distributed to the stockholders* "fifteen days before the meeting."

As the American Trotting Register Association was not organized *thirty days*

before May 19, how did the board succeed in this instance in complying with the by-law XII quoted? And if by-law II as *originally* adopted required amending (as it did) in order to make it comply and agree with the object as set forth in the charter, viz.: to provide also for the registration of pacers, why was it not altered so as to comply and agree *in toto* with the objects *as set forth in that charter?*

Neither, as nearly as I can recall, did the secretary of the Association live up to the spirit and interest of by-law XII, section 2, which says: "And the secretary shall cause the same (viz. the proposed amendment or alterations) to be printed and distributed, etc."

I received a notice of the meeting at which it was proposed "to amend the by-laws," but I have no recollection that that notice stated or caused "the proposed amendment or alteration" to be printed therein, which is my intepretation of the language used in the section referred to. I may be wrong in thus interpreting the section, but if so, then it seems to me that under the charter and for the purpose of improving the *value* and *breeding* of the trotting and pacing-bred horse, the board, by simply calling a meeting to amend the by-laws and not expressly stating wherein such "amendments and alterations" are to consist, may do anything reasonable or even unreasonable, without giving the *masses* who are interested in the breeding thereof" a chance to exchange views, discuss or express opinions as to the proposed action of the board.

If it be "benign influences" that the breeders of trotting horses are looking for, allow me to suggest that the "non-standard" trotter (of the past) seems to have answered that purpose to a very considerable extent, and many of us believe that it *may* continue to do so for some time in the future. Is it not just as reasonable, if not more so, then, to admit a *non*-standard trotter to "standard rank on a basis of a record of 2:35 or better," as to admit the pacer "on a basis of 2:25 or better?" Would it not be more in line if "establishing *the* breed of trotters," which our predecessors have so *unexpectedly* succeeded in doing, in *only* forty years since the birth of Hambletonian, 10, the great progenitor of trotters? If, in those forty years, we have succeeded in so improving the breed, or have so advanced our knowledge of breeding to the extent that instead of producing aged horses to trot in 2:17¼, we now have stallions sireing yearlings that trot in 2:25¼, two-year-olds in 2:10¾, three-year-olds in 2:10½, etc., is it unreasonable, I ask, to believe that by further proper selection, in forty years more we shall have a breed of trotting horses that will sire trotters, and *nothing but trotters?*

Does the commingling of pacing with trotting blood improve the *value* and *breeding* of the trotting horse? Do we find Mr. Alexander breeding Miss Russell or her daughters to a pacer, or to a sire of phenomenal pacers? Will Mr. Bonner breed Maud S. to such? Do you think Mr. Forbes would give the preference should he breed Nancy Hanks to the trotting-bred Direct over Arion or Allerton, even though he did not own either of the latter? Is that where Mr. Forbes would go in search of "benign influences" to get a purer, faster and gamer trotter and to *improve the value and breeding* of the trotting-*bred* horse he expected to be the issue thereof?

Such practices on Messrs. Alexander's, Bonner's or Forbes' part *might* (?) prove one of the "possible ways of advancing their interests as breeders of trotting *and* pacing horses," but, *was such the purpose in view* when the convention of *trotting-horse breeders* was called and when it organized as a *Trotting* Register Association?

Did those gentlemen or their representatives and others present at that convention agree to pay $130,000 to Mr. Wallace for a register of *trotting-bred* horses, with the intention immediately after the purchase thereof to establish a *new breed*, which the Wallace Trotting Register did not cover?

WILFRED PAGE.

[Mr. Wilfred Page is a stockholder in the American Trotting Register Association, and as such is entitled to the use of the columns of the MONTHLY to voice his sentiments and criticise the actions of the officers of the Association. Had he evinced as much concern in promot-

Google

ing its welfare, and come to the convention and aided in its formation by giving timely advice and admonition as he has in trying to pull down what others have unselfishly labored to create, by devoting their time and pledging their individual means, his criticisms would be in better taste and of greater weight.

The charter gives the Association the right to publish registers, but there is nothing mandatory there in saying it *shall* publish registers; it is a right or privilege granted, and it may publish one or a dozen as it may elect. A great many charters give the right or privilege to do several specific things, any one of which may be done and the others held in abeyance or left undone entirely without a violation of chartered rights or of the charter itself.

Mr. Page says: "The convention, like the editor, recognized THE TWO BREEDS, and intended to provide a register for EACH." No one denies this proposition, and it is just exactly what the board of Directors did when it provided the conditions of admission of the pacer.

The board has not "WIPED OUT OF EXISTENCE the 'breed of standard trotters' and in its place established a breed of trotters and pacers," but by virtue of authority vested in it by the convention and charter has adopted a standard by which both trotters and pacers coming within the provisions of the standard can be registered. Mr. Page does not wish to be told that trotters beget pacers and pacers beget trotters. The fact no doubt is unpalatable, but it is, nevertheless, a fact, and all the quibbling of the trotting purists can not wipe it out. Certainly, Mr. Page has a wonderful method of argument, when he asks a question and then lays down the law how it must not be answered. We do not wish to take issue with the gentleman "that there is a great deal that I (he) don't know," but if he will look into the by-laws as closely to find out what the board can do, as he apparently has to find out what it can not do, he will have no difficulty in finding that the board has authority to manage the affairs of the Association.

Whether the breeders of pacing horses were invited to attend the convention or not, is of little importance. They were there, they were recognized and welcomed, and Major Campbell Brown, the most prominent breeder of pacing horses in the world, was appointed chairman of the Committee on By-Laws and made the report to the convention. When the representative of the convention and the representative of Mr. Wallace failed to agree upon the price to be paid for the property, it was Major Brown who was called in to settle the matter of difference, which he did to the ultimate satisfaction of both parties to the contract; and this affront and charge that the hard-worked and genial gentleman from Tennessee was an unbidden and unwelcome guest at America's greatest breeding convention, will be a greater surprise to the members then and there assembled, than to the honored gentleman himself.

Had the gentleman from California taken enough interest in the great convention to be present, he would not have found it necessary in his article to ask whether there was any dissatisfaction expressed with the then existing standard, and whether "two breeds" should be admitted to the distinction of registration? Among the "great deal I (he) don't know," he would have found out that there was dissatisfaction, and that somebody did ask to have "two breeds" admitted to the standard.

The board of directors did not decide that the "breed of standard trotters shall no longer exist," but on the contrary, made provision for its existence forever, by pledging their individual fortunes, to the sum of nearly one hundred thousand dollars, and that their philanthropy and generosity has been appreciated is evidenced by the fact that over four hundred of the leading representative breeders of the country are now stockholders in the Association.

The convention did not and could not organize the American Trotting Register Association at that time, but decided who should be members of the board of directors when it was legally organized, subject to the approval of the stockholders, with the express understanding that the board of directors should adopt all rules and regulations for the management of the affairs of the Association, and

the action of the board of directors thereby became the action of the convention itself.

Section 2, of article XII, does not apply to the board of directors in making amendments. The board of directors derives its power to make amendents from section 1, of article XII, which does not require thirty days' notice of proposed amendents, but, notwithstanding this fact, when a meeting of the board of directors was called, for the purpose of making amendents, the president, out of abundant precaution, notified the secretary thirty days in advance of the called meeting of the proposed amendment, and the notice sent fifteen days before the day of the meeting, specifically set forth the amendment proposed, as the gentleman will see by referring to it, and will prove the truth of the aphorism that "a poor pen is better than the best memory."

Even if Mr. Forbes should prefer to breed Nancy Hanks to Arion instead of to Direct, there is nothing in that fact that should prevent both horses being registered in the same register.]

THE METHODS OF PALO ALTO.

BY S. T. H.

Palo Alto is the wonder of the nineteenth century in its successful breeding of the swift-trotting horse. The fact that at one time, and all in one year, it held the trotting records for all ages, proves that there is not the least exaggeration in the statement. The home of Guy Wilkes only during a single season held the yearling record. The home of Maud S. at one time won the record for all ages; and the homes of other turf performers have held the trotting records for the intermediate ages. But no single stock farm ever before held the combined records for all ages. All this has been accomplished at Palo Alto within the period of fifteen years, although the fast trotting horse has been in existence on the continent ever since the year 1829, when Top Gallant trotted three miles in eight minutes and eleven seconds to harness. This phenomenal success has many elements of wonderment. It has not been made with aged horses, but almost entirely with immature colts, that every season have lowered the amazing records of colts bred elsewhere of the same age. The law of maturity as necessary to the attainment of the greatest physical exertion in the horse, as in the human constitution; the law that early maturity insures early decay; the law that the sire produces his greatest progeny in his prime; the law that developed speed should produce the greatest trotting performances in the progeny of the trotting horse, as it does in the descendants of the blood horse, are, one and all, comparatively defied in the splendid successes of Palo Alto. The owner is not a horseman by descent or lifelong occupation. He is one of the leading business men of the western world, who, in his mature life, after great success had been attained in amassing a colossal fortune, by building a still more colossal railway across the almost insurmountable mountains and deserts that separate the Pacific from the Atlantic ocean, turns his genius to statesmanship for honor, and to breeding the American trotting horse for recreation, and in both spheres his succes is equal to his Midas-like capacity for turning everything he touches into shining gold. To-day the fame of Palo Alto is worldwide. It is better known in Russia, the home of the only other breed of swift-trotting horse, the famous Orloffs, than any other, or than all the other trotting stock farms of this continent put together. This remarkable success, and this far-reaching fame, accomplished in less time than the average duration of equine life, are not the results of following well established trotting-horse precedents and usages, but distinctly the outcome of the novel methods of a single mind—the founder of Palo Alto; which methods he insists upon being carried out to the letter by the wisest of trainers as well as by the novices of the sulky in his employ. Having eclipsed all American trotting-horse breeders, he has perfected his arrangements to commingle his trot-

Digitized by Google

ting strains with that of the Russian Orloff, by the double crossing of the Palo Alto sires with Orloff dams, and vice versa.

But these gigantic enterprises in breeding the trotting horse according to his own methods are not to be limited to the life of their founder, as, unfortunately, were those of the lamented McFerran and Gen. Withers. By virtue of his munificent endowments, they are to be continued into the distant future. Nor is their application to be confided to untried and untrained trustees. The grand college of learning known as the Leland Stanford Jr. University, and the magnificent ranch of 800 acres of land that has become historic as Palo Alto, from whose meadows and slopes the genial sun of California forever banishes the chill breath of frost, are to be the ample means of continuing and perfecting these methods of producing and developing the trotting horse, until he not only compasses a mile in two minutes, but approximates to the speed of the thoroughbred horse.

These methods are not to be the dogmatic *ipsie dixit* of a single mind inflated with accidental success. Their originator has publicly said that this extensive breeding establishment, comprising nearly 400 animals, together with this vast body of land, properly irrigated and furnished, complete in all its appointments, is to pass to the trustees of Leland Stanford Jr. University. The lines of breeding and the methods of development laid down by their founder are to be carried on by the university, with only such modifications as the science of breeding may demand. Skeletons of great breeding sires like that of Electioneer, and of great performers like that of Occident, are to compose the anatomical specimens of the horse museum for thoroughly studying the breeding problem. The learned professors are to be demonstrators of this complicated anatomy, as well as the practical directors of the daily development of the yearly produce. Already the president of the university and some of the professors have become fascinated with this horse field extending beyond the narrow pages of their college text books; and the scheme that the cynic might pronounce Utopian, if its founder had passed away before its realization, is now one of the established conditions of Palo Alto.

The comprehension and thoroughness of this breeding endowment may be appreciated when it is added that no empire on the globe has ever yet attempted to establish so extensive and learned a system of producing blooded horses. The studs of England and France and Germany and Italy dwindle into insignificance in comparison, and the private horse farms of the nobility, or of professional turfmen, who produce and perpetuate the race horse for amusement or gain, are not worthy of mention with this far-reaching enterprise of a single millionaire American citizen.

Strange to add the founder of Palo Alto, unlike that other American enthusiast of the peerless American trotting horse, Mr. Robert Bonner, does not retain for his own pleasure the great trotting performers of his own production. With a broad spirit of enterprise, coupled with an unselfishness as remarkable as any other feature of his breeding establishment, he sells, to all comers, the very choicest of his trotting horse productions, until he has literally restocked the leading trotting-horse stock farms of America with superior breeding animals. Thus catholic in its spirit, novel in its methods, enduring in its endowments, extensive in its fame, and unequaled in its success, Palo Alto deserves to be reviewed in the same comprehensive spirit in which it was conceived and is managed.

In a recent interview, Senator Stanford says: "The principles on which it is "founded are as simple as the alphabet. "When I began breeding blooded horses "I commenced studying the anatomy of "the horse, until, at the end, I could take "the skeleton apart and put it together "with the accuracy of a skilled watch-"maker who deals with the mechanism of "a timepiece. *In my studies of the "anatomy of the horse, I soon discovered "where his greatest powers were, the uses "he made of his muscles, and the secret "why one horse was capable of greater "speed than some other horse. As I "studied and pondered and experiment-"ed, as the years went by, I became im-*

Digitized by Google

"pressed with the fact that extreme speed "came from three things, viz.: Breeding, "physical conformation, and will-power "or nerve force.

"As soon as I was fairly able to get "my bearings, I began to lay deep the "foundations of my breeding stud on an "Oriental basis, and I am, every year, "eliminating from my establishment, as "fast as circumstances will permit, all "traces of cold-blood, wherever it has crept "in, in the far past. But it must not be "presumed that I am not extremely crit-"ical in the selection of thoroughbred "mares. In selecting a thoroughbred "mare I judge largely by the shape of "the head and the expression of the eye. "If the head and eye do not suit me, "although the conformation and breed-"ing may be perfect, I pass her by; for, "although a horse does not trot with "his head, yet without he has a head I "hold he can not trot."

This is by far the most candid and comprehensive presentation of the principles of Palo Alto that its founder has ever presented to trotting-horse literature. The reference here seems to be confined strictly to the matrons he has selected, but that his confidence in thoroughbred blood goes further is evidenced by this radical statement in the same interview.

"I am so confident that the thorough-"bred can be made to trot fast that I "have in training a yearling thorough-"bred filly. I have named her 'Experi-"ment.' If she proves a success I shall "then be prepared to do the proper "amount of boasting."

Thus far he has not installed a thoroughbred horse at Palo Alto as the sire of fast trotters, although he has owned thoroughbred horses for many years. If "Experiment" succeeds as a trotter, then a thoroughbred sire for trotters will be logically in order. What measure of success could be attained upon the strongly inbred trotting dams of the present day can hardly be determined with accuracy from the past. Alexander owned both Planet, the sire of Dame Winnie, and imported Scythian. The former, it was often rumored, could show nearly, if not quite, three minutes on a trot to the saddle, when exercising for his running races. The writer has often seen him in these morning exercises. His knee action, for a thoroughbred, was bold and commanding, while his pertinacity to stick to the trot, despite the jockey's urging to force him into the gallop, has often been noticed. Imported Scythian was a natural trotter. His trotting action had a striking resemblance to the mighty stride of Lady Thorne. It was claimed for years in the trotting-horse circles of the Blue Grass region, that he could trot a full mile in two minutes and fifty seconds. Lexington, too, was thought to be potent enough to cross with trotting mares and produce trotting winners beyond a peradventure. When the trotter was just beginning to be tolerated in Kentucky, where the thoroughbred and his owner reigned with supreme disdain, the only way in which the trotter could hope to be recognized by the autocratic horse majority, was his enrichment by the infusion of racing blood. The blooded sire was used freely, while the blooded mare was the popular rage. The former proved to be a comparative failure, while the latter was much more successful. Exchequer has two standard trotters, both out of pacing mares. Bonnie Scotland has one out of the famous pacing-bred brood mare Waterwitch, while, to the embrace of the trotting sire Belmont she produced three standard performers. Neither Lexington nor Planet, nor imported Scythian are represented in the standard trotting tables, because they never produced a trotter that secured a standard record. Possibly the daughters of Pilot Jr. and of Alexander's Abdallah and of Edwin Forrest and of Norman may not have been sufficiently strong in trotting inheritance to produce fast trotters to the embrace of these notable thoroughbred horses with trotting proclivities; but to the embrace of trotting sires from these trotting-bred mares have come the trotting-turf winners that have brought to Woodburn all its trotting wealth and fame. But until "Experiment" becomes Demonstration the breeding principles at Palo Alto will not be extended to include a thoroughbred sire for trotters. Thoroughbred dams have the earnest of a more general success, but in comparison

Digitized by Google

with half-bred dams they are nearly doubly outnumbered, and they, in turn, receive the same odds from trotting-bred dams when the tables of the standard performers from the loins of Electioneer, the most successful trotting sire, from all classes of dams are carefully studied. He is the sire of 100 standard trotters; the dams of fourteen are thoroughbred; the dams of twenty-six are half bred; the dams of forty-eight are trotting bred, while twelve are out of pacing-bred mares. When the question of supreme speed is considered, six out of thoroughbred dams have trotted in 2:25, or better; ten out of half-bred dams have records in 2:25, or better; five out of pacing-bred dams have trotted in 2:25, or better; while thirty-two out of trotting dams have trotted in 2:25, or better. Thus not quite one-half out of thorough bred dams five-thirteenths out of half-bred mares five-twelfths out of pacing-bred mares, while two-thirds, out of trotting-bred mares, have accomplished the same feat. The average ratio of extreme speed thus largely favors the strictly bred trotting performers. It is undoubtedly true that the Queen Sunol's dam is half bred, while Palo Alto's dam—the champion stallion, is strictly thoroughbred, from which it might be argued with great show of strength that extreme speed comes from either the half-bred or the thoroughbred dam. This position seems to be still further strengthened by the instances of the exqueen, Maud S., 2:08¾, and of Jay Eye See, record 2:10. But in the list of trotters out of thoroughbred dams the falling off from Palo Alto, 2:08¾, to the next best recorder, Ansel, 2:20, is very striking, while the tabulation of better results has improved from the list of trotters, with half-bred dams, to the best showing of performers with trotting dams. The fastest Electioneer yearling is trotting-bred, and so is the fastest two-year old, so that extreme speed, coupled with extreme youth, is decidedly in favor of the pure trotting-bred produce of Palo Alto. The two-year old record of Arion, 2:10¾, is justly regarded as the best trotting performance ever made. Since Senator Stanford has parted with him for $125,000, the highest price ever paid for a trotting horse, he says in the interview above quoted, that he expects him to lower his record next year. Another consideration which the proprietor of Palo Alto seems to have ignored, is the fact that the combination of the Hambletonian sire and the Clay dam in Electioneer has proven to be the very best commingling of trotting strains to produce both extreme and frequent speed. For while Electioneer stands at the head of trotting sires, the next best stallion, by the record, is George Wilkes, bred in precisely the same blood lines. This prepotency of trotting blood must have largely controlled the action as well as the speed of the sons and daughters of Electioneer out of thoroughbred mares, for neither Gen. Benton, nor Piedmont, nor Nephew, his companion stallions at Palo Alto, have been able to produce anything like the same average of standard performers out of thoroughbred mares. Gen. Benton has only one out of his fourteen standard performers; Piedmont has none out his eight, while Nephew has also none out of the same number of performers. But the great desideratum in the problem of breeding the trotter is the power of transmission. To be valuable this potency must descend in a constantly increasing ratio. Palo Alto is the pride of the ranch, because he has won the champion stallion record, and because his dam is thoroughbred. He is nine years old, and yet he has not a single representative in the standard list. Ansel, twelve years old, has three standard representatives, while Whips, nine years old, has only two standard representatives.

This completes the list of the successful producing sons of Electioneer out of thoroughbred mares. His sons out of half-bred mares have done much better. Anteeo has placed seven standard performers in the tables. But Palo Alto's sons out of trotting-bred mares both outrank and outnumber those of half-bred mares. Thus there are thirteen of these sons that are successful sires. Elector has seven, and Eros has six, one of them having secured a record of 2:16, faster than the produce of any of his half-bred or quarter-bred sons.

Digitized by Google

But the student of trotting statistics

can only arrive at a fair conclusion by comparing this half-bred and quarter-bred produce showing of Electioneer, as to their capacity of breeding on, with the trotting-bred descendants of George Wilkes. To make this comparison perfectly just, it is eminently fortunate that both were bred in the same blood lines, both having Hambletonian for their sire, and both having dams of the same Clay family, the one being a daughter of Harry Clay 45 and the other of Henry Clay 8. It is equally pertinent for the purposes of this comparison that while Electioneer was largely mated with thoroughbred and half-bred mares, the harem of George Wilkes was confined almost exclusively to trotting-bred matrons. Electioneer leads George Wilkes, as a sire, in both the number and speed of his standard performers. Other conditions, such as their comparative ages and vitality when their stud careers began aside, Electioneer should have thus gained the supremacy: for his dam, the wonderful Green Mountain Maid, has presented seven standard performers to the turf, besides producing Mansfield, who has sired three standard trotters, while the dam of George Wilkes, the road mare, Dolly Spanker, never would have been in the tables of great brood mares had she not produced him. Ansel, the half-bred son of Electioneer, leads the list in this class of breeding. He has three standard representatives. Red Wilkes leads the list of the sons of George Wilkes out of trotting-bred mares. He has sixty-five standard performers, but he is six years the senior of Ansel.

Anteeo leads the successful sons of Electioneer out of half-bred mares. He has seven standard trotters. Onward is the next best son of George Wilkes, of trotting lineage. He has forty-two, or six times as many standard representatives as Anteeo. Onward is four years older than Anteeo. Electioneer has no grandson sired by a half-bred son, and only one grandson, Anteeo Jr., whose sire was out of a half-bred mare, that has produced a standard performer. George Wilkes has thirty-eight grandsons by trotting-bred sons out of trotting-bred dams, that have produced standard trotters. Thus the trotting-bred sons and grandsons of George Wilkes so greatly outnumber the half and quarter-bred sons and grandsons of Electioneer that the owner of Palo Alto must have that confidence in the future capacity of thoroughbred dams, for breeding trotting produce, with average uniformity, which is not warranted by trotting-turf statistics up to the present time.

The further methods of Palo Alto will be reviewed in a succeeding paper.

HORSE-BREEDING IN RUSSIA—THE ORLOFF TROTTERS.

BY HEATHERBLOOM.

Russia is a country of vast extent, varied climate, many peoples. It is, when numbers are considered, the greatest horse-breeding country in the Old World. There, therefore, the horse occurs in multitudinous forms.

The native breeds have size and substance, with driving action. Besides these native breeds, Russia has her tens of thousands of Caucasian ponies and Oriental Galloways. All these are of very indeterminate character. On inquiring into the statistics of horse production in the different states of Europe, it will be found that Russia stands pre-eminent. She not only produces largely on her own vast southern plains, but, from her vicinity to the great equestrian races of the East, she has imported very largely.

Those Eastern horses—and indeed Russian horses generally, although with much blood, and useful wiry animals—are, in general far too small, either for modern warfare or for purposes of luxury, and accordingly, among the Russian nobility, there is scarcely one who has not had an extensive breeding establishment for the purpose of improving the original stock.

Pre-eminent among these is the Orloff family, who have succeeded in establishing two distinct breeds, that have gained so high a reputation, and toward which attention has lately been directed.

Google

The native horses of Russia, according to the Duke of Newcastle's famous treatise, were small, of ordinary shape, and quite disregarded by other nations, yet active, hardy, and of great strength of constitution. But the horses of Russia have been greatly improved during the eighteenth century, not only by the admixture of superior blood from the Eastern provinces of the Empire, but by the establishment of large studs in various parts, in which Turkish and Persian stallions have been introduced, as well as Danish and Holstein, but of late years, English thoroughbred and half-bred horses have been generally preferred. In the former part of the reign of the late Empress Catharine, or perhaps somewhat before that period, an imperial stud was formed upon the river Ruduia, intended to supply the guards with horses. It consisted of four hundred mares and about fifty stallions, chiefly of the above-named countries. These stallions cost, at that time, nearly $1,000 each. The Russian court, and the nobles in general, have since been liberal customers of Britain, sparing no expense in the improvement of their studs, some of which are very extensive. Good trotters are found in Russia, and there was in England a gelding from thence, which trotted a single mile in three minutes, performing in good style. The dangerous custom prevails in St. Petersburg of driving in the streets at full speed, regardless of the pedestrians. The Russian trotter above cited was good for about two miles. Lawrence mentions several distinct breeds of Russian horses. The Kalmuck Tartar horses, which "are the best;" they are excellent swimmers. The Nogay Tartar horses are used for carriages. The Taberkesse, of the Caucasus, for cavalry. The Azof Cossacks are hunted for their flesh. The Tarpans, the Roolan and the Turkans are also mentioned.

The above is, in short, what was known of the Russian horses during the last century. The originator of the Russian trotter as known to-day was the stalwart, unscrupulous Alexis Orloff, whilome private in the guards, and brother of the celebrated Gregory, the lover of Catharine II. For the "chivalrous" conduct of Alexis to the family of the Pacha commodore, having captured the same in his victory over the Turkish fleet in 1772, the Pacha, to evince his gratitude, soon after presented to Count Alexis the celebrated Barb Smetanska, progenitor of the two celebrated Orloff breeds, and whose skeleton is reverently preserved in the Orloff Museum to this day. Count Alexis commenced his stud in 1770, and Russian horse-breeders give the following list as the first occupants of his stable:

	Stallions.	Mares.
Arabs	12	10
Turkish	1	2
English	20	32
Dutch	1	8
Persian	3	2
Danish	1	3
Mecklenburg	0	5

Smetanska, from a Danish mare, got Vulcan, who was the sire of Barss, out of a Danish mare. Barss exhibited extraordinary trotting powers, and all the modern trotters of Russia trace their lineage to him, and daughters of Smetanska, out of English and Arab mares. Count Orloff also obtained from England two sons of Eclipse, two sons of Highflyer, and the winners of the St. Leger in 1792, and of the Derby in 1794, Tartar and Dædalus, besides many others.

The race of trotters thus produced became a distinct type in about thirty years, and curiously enough, since that period, all attempts to improve the breed by fresh blood, whether Arab, English, French, or Dutch, have failed. Count Alexis was most unwilling to sell any of his best sires, and at his death, in 1808, he provided by his will that none should be disposed of. It was not till 1845 that the prohibition was removed, when the Russian government bought from his daughter and heiress the Krenowaya stud. And now it is calculated that there are no fewer than 1,600 private studs in Russia, with nearly 6,000 stallions, and upward of 50,000 mares, from which the Orloff trotters are produced.

The trotting performances of those animals are very remarkable, and their stoutness is equal to their speed. The Orloff trotter does not appear to gain the perfection of his powers till he is eight or nine years old. The French stud officers who attended the horse exhibition of Russia in 1869, found that

Digitized by Google

these animals were selling at from $600 to $1,400 a head, which were remunerative prices to the Russian country gentlemen. It does not appear, however, that these celebrated trotters at all come up to the mark which is required for a first-class equipage either in London or Paris.

Besides the Orloff trotters, the Orloff saddle-horses are equally celebrated. These are also descended from Smetanska, and from another Barb called Sultan, crossed with Anglo-Arab blood. According to Russian writers, they combine the good qualities of both their parents, and, without equaling their English progenitors in speed, they exceed them in beauty, soundness, docility and aptitude for all military purposes. Like the trotters, they maintain a distinct character, and every attempt to introduce fresh doses of English or Arab blood has failed as signally as in the trotting family.

In addition to the private studs above enumerated, the Russian government, like, indeed, all the governments of the European continent, maintains large studs at the charge of the state. Some idea of the horse resources of the empire may be gained from its being found necessary to divide into fourteen classes the animals brought forward to compete for prizes at the annual exhibitions. The list is as follows:

1. Thoroughbreds, English and Arab.
2. Saddle horses, half-bred.
3. Orloff trotters.
4. Carriage horses.
5. Carabaghs. Saddle horses, crossed from Arabs and Trouchmens.
6. Trouchmens. A fine breed from Central Asia, much resembling the Arab.
7. Horses from the Don. The well-known irregular cavalry horse of the Cossack.
8. Cart horses.
9. Betugs.
10. Finlanders.
11. Smouds.
12. Baschkins.
13. Ponies.
14. Horses from the Caucasus.

The five enumerated last are not of much importance. The above particulars were secured from Mons. J. Morder's work on Russian horses, published 1868, at St. Petersburg.

Interest regarding the Orloff trotter has been stimulated in this country just now by the fact that the Czar of Russia, through the proper officer of his government, has proposed to exchange ten head of Orloff horses for an equal number of animals carrying the blood of Electioneer.

"I doubt not," remarked Senator Stanford, in an interview lately, "that the Czar's intentions in proposing the deal between us are to attain great speed. Sometimes it is necessary for the Czar to travel fast. When I was in Russia two years ago I stood at the imperial tracks and timed some of the Czar's roadsters. They made the distance in 2:30 to a drosky." Continuing the senator remarked, "It required a special ukase from the Czar to the people, which was proclaimed through the master of equerry, in order to make our contract perfectly legal from a domestic standpoint. The czar would not have dared profane the sacred breed without explaining the full purport to the people and showing them that it was only to be a carefully guarded experiment. You doubtless observed that the czar specified that all the horses he would send would be stallions. That would prevent the continuation of the Orloff breed in this country, so that each generation of the progeny of the American importation would get farther away from the Orloff, and finally be swallowed up in our domestic stock. On the other hand, if the czar is pleased with the blood of Electioneer, we may see a revolution in the equerry of Russia and the long line of the house of Orloff supplemented by the pride of Palo Alto."

A gentleman who recently visited Russia describes the Orloff breed as "short, thick and stubby; coal black and glossy. They possess much vitality. They are driven unreined, and put their noses close to the ground, and fairly run when hitched to the Russian drosky."

In reference to Senator Stanford's remarks as to the general swamping of the Orloff blood in the American trotter, it might be asked, if it would be desirable to maintain its integrity, could not this be attained? We think so; by setting apart certain mares as a foundation stock and using none but Orloff stallions on

Digitized by Google

them and their produce, as long as such stallions could be used, and selecting as successors males with the greatest amount of Orloff blood to head the stud so produced. Continuing in this way, a distinct family, at any rate, could be procured. This, it will be noted, was the method adopted of establishing the Orloff strain itself. The experiment would be worth trying, and interesting also.

The Orloffs are "large" horses, generally of a brown color, the next commonest color being gray. They are fast, according to European notions, with a shooting action of the forelegs which is not admired in eastern countries. But this peculiar action may be well calculated for sledge driving. They are not now so highly esteemed abroad as formerly, as there, in harness horses, action is more required than pace. In pace they can't compete with the American trotter. Under the conditions existing, it will be interesting to watch any experiments in America in training the Orloff horse, if an importation should result from the negotiations between the Czar and the proprietor of Palo Alto. As traveling will in Russia continue to be done mainly by the horse, the national importance of the breed is at once apparent.

The turf has been established for over sixty years in Russia. Any "crookedness" at once insures a free passport to Siberia—a most effectual check, it will be admitted, on all connected with the sport. The best time made in Russia, corrected to agree with our way of timing, is one mile in 2:31. This was some time ago. But it must always be borne in mind that improvements in racing appointments in Russia are rarely, if ever, made. The droskys to which the horses are hitched are light sorts of road wagons weighing seventy pounds each.

The lesson learned from a study of the method of breeding the Orloffs is simple. After the breed had become fixed, which is generally accomplished in every breed by the influence of one or two particular animals' blood) no sire of outside origin was used or introduced. The sires were derived and selected solely within the stud. Mares of foreign breeds, however, have been admitted experimentally.

This explains the preference expressed for mares of the American trotting breed by the Czar, in his proposed interchange of animals with Senator Stanford.

The Use of Toe-Weights.

A THOUGHTFUL, INSTRUCTIVE AND INTERESTING LETTER BY A WELL-KNOWN DRIVER.

EDITOR OF THE MONTHLY:

Toe-weights properly and judiciously used, are one of the necessary and useful articles found in the equipment of a training stable. They are a great aid in developing as well as in assisting to keep a horse sound and always ready for his lessons.

Numerous arguments could be presented in favor of their use, but I consider the facts that, with them we can avoid the necessity of having horses so often in the blacksmith shop, the loss of valuable time traveling to and from, and the risk of injury while there, both by accident and the unnecessary taking off and putting on shoes, the most important. Many a would-be successful horse is turned out on account of his feet, whereas, had he not been to the shop so often, but, instead, a toe-weight had been used to help balance him, he would now be a bread winner.

Toe-weights in the proper hands become an appliance that saves much time and labor, lessens the expense of training and is a guide to go by, so that when the trainer has his horse shod he knows almost exactly what the weight of the shoes should be, and when this is the case great good has been accomplished. It is possible the day will come, and perhaps is approaching fast, when horses that are obliged to carry over five or six ounces will not be trained for speed, but at present there are a great many that require twelve to twenty ounces to keep them in balance. Horses in training are given many more slow miles than fast ones, therefore, by the use of toe-weights, the horse may be relieved of several ounces, which is quite an item in a week's jogging of from thirty to fifty miles. It is the constant dropping that wears away the stone. Shoeing seems to be a "necessary evil," and until some one discovers a more perfect way which will serve the purpose

Digitized by Google

better, it follows that the less frequently a horse goes to the shop the better for him, up to the point where it becomes a necessity.

Again, by the use of toe-weights, we teach the horse to go with lighter shoes, as the weights are not used in slow work. Constant practice in any one direction develops skill, and so, driving constantly with light shoes helps to teach the horse to travel without heavier ones and to preserve his balance. I mean by this jogging work or slow work, it being given with a light shoe on, with an occasional brush up to the limit of a perfect balance, and not beyond it. This will teach a horse to speed in lighter shoes—the same as an athlete, by constant practice, is able to perform his wonderful feats.

There are many erroneous notions abroad in regard to the use of toe-weights, and like many other absurd things they come from people who never give any study or thought to the subject which they condemn or praise. One season while at the track a gentleman drove in and introduced himself. He said he was looking after a good road horse, and wanted one that could go along in 2:40 or better. I showed him one which suited him exactly in color and style. The price was agreeable if the speed was all right. I ordered him hitched, drove him to the track and showed a mile in 2:38 without a sign of a mistake of any kind, but upon unhitching him the man discovered he wore four ounce toe-weights. His smiles turned to expressions of disappointment. It was impossible to explain to him anything more. I hardly think he would have taken the horse as a gift. Two weeks the same gentleman drove in to see me and to show his new road horse, that could go without toe-weights. He had bought him a few days before and had timed him a mile in 2:40—without weights. I noticed he had quite a shoe on without taking up his foot, and quietly sizing him up inquired how much weight he had in the shoe. He did not know exactly, but thought thirteen or fourteen ounces, but did not care what it was, as he would have him shod with about twelve-ounce shoes, and would drive up and give him a mile. The following afternoon he was on hand with a few friends to show them the new purchase, borrowed a light cart, went out, and the horse, to his utter humiliation could not go a mile in three minutes. He consulted me about it and wanted me to try him. "Oh, no! not with those shoes. You have taken off at least twenty ounce shoes and have not got more than twelve ounces on, and he is not in balance." He declared he had been swindled and deceived and would not keep him.

"Did you ask the man you bought of how much weight was in the shoes?"

"No, all I wanted to know was if he needed toe-weights, and was told no; that he neither wanted toe-weights nor boots." The fact was, the horse had on twenty-one ounce shoes in front. Here was a man intelligent, thrifty, and probably able to write a good essay on political economy, and yet condemning toe-weights wherever he had a chance, apparently not knowing their use. I have no doubt many trainers could tell you their experience is the same. Toe-weights properly used and carefully put on, are a great benefit to the trainer, but like many other good things, improperly used become dangerous. When a horse has graduated and goes out as a road horse, put the weight in the shoe, but while in school, if it is necessary to carry more than twelve ounces, certainly use toe-weights.

T. J. Dunbar.

The Use of Stallion Shields.

Editor of the Monthly:

Among the many curiosities of the stable, I desire, as briefly as possible, to call attention to the stallion shield.

We find it in the stable of the humblest driver, the professional, and in the private barns, and a large majority of the stock farms. It is carried by the baby colt and the aged horse alike.

As soon as the colt arrives at an age when nature asserts itself, or from exuberence of his being, is assailed with carnal concupiscence, and in consequence extends his organ of generation to air it, which, by the way, is healthful, he is at once marked to bear the shield.

The prostate gland secretes a thin, transparent fluid, which flows into the urethra for the purpose of lubricating the

Digitized by Google

canal before copulation. A horse will often discharge a few drops, when an ignorant groom will immediately report that the horse is abusing himself. If the emission should contain spermatozoa, would it not be a symptom of the disease termed spermatorrhœa, and by the use of a shield would you not be treating symptoms instead the disease itself?

First find the cause, remove it, and then the disease will cure itself. The chief cause of spermatorrhœa is idleness and overfeeding. Give the animals from two to ten miles daily, with due allowance of grain, and give the shield to some one who believes those symptoms should be treated.

It is safe to say that not one horse in 2,000 suffers from spermatorrhœa, and yet, if we may believe the grooms, a majority suffer from it. Where the disease does exist, an owner may well become alarmed, for it is a serious affair, and one demanding careful treatment.

SAN JUAN.

Blue Bull 75.

RECENTLY the writer requested Green Wilson, of Waldron, Ind., to relate his early recollections of Blue Bull 75, that reigned for several years as king of trotting sires. The former owner of the grand hero cheerfully complied.

"Well, you see my old Tom Crowder had died, and I was advertising for another fast pacing stallion. This was at a time when horsemen congregated at the Fifth street stables at Cincinnati, Ohio. I went down there on Monday. All the talk was about the great dash of speed made there on the track the previous Thursday. I learned that Daniel Dorrell, of Rising Sun, Ind., had been over there and blowed big about his fast pacing young stallion that could go a mile in 2:32. It didn't take long for him to get a bet. Bull Baby, as he was then called, was to go against time and beat 2:35 for $300. Bets were six to one against him. He was to pace under saddle (sulkies hadn't come around then).

"Mathew Smith, Ben Higdon and George Crane were in the stand. The rider weighed 158 pounds. At the one-half mile Ben Higdon said no horse on earth could come fast enough to win, but Bull Baby passed under the wire in 2:32—last half in, at least, 1:09. Well, Fifth street was all excited over it yet when I got there. When Andy Bussell told me all about it, and other people on Fifth street were telling the same thing, I thought, 'There's my chance.' So I followed on to Rising Sun and saw Dorrell and the horse. He said the horse was by Blue Bull, of Ohio, and he by Blue Bull, of Pennsylvania. He showed me one of his bills with this pedigree. Also on the bill was the affidavit of six men that the dam of Bull Baby had traveled eighty-five miles in nine hours. I think it was when some of Dorrel's family was sick.

"The horse was now four years old. He was sold as a weanling for $35. I learned when he was a yearling they had him down to alter. But, as one testicle could not be found (and never did appear), they let him up and he remained a stallion. I traded a Gen. Taylor stallion for a half interest in him, and think I gave $150 to boot. Dorrell sold the Gen. Taylor horse for $900.

"I took Bull Baby home with me and kept him two and a half years and called him Young Lexington. While I kept him he sired the $7,000 chestnut mare Kentucky Girl, owned by John Beggs, of Cincinnati.

"I sold a Jew nine head of horses, one, Lady Stansifer, for $450, by my horse. I told him she was worth all the rest. Col. Gilrooth was commanding a post near Vicksburg, where Lady Stansifer made a record, trotting in 2:22½. But she was never credited to my horse. Dorrell and I traded together a good deal. We had two common horses in partnership. I gave him my interest in the two at the Fifth street stables and $500 for his half of our horse.

"After I owned all of him I took him to Indianapolis and paced him on the Sugar Grove track against 'Buckshot,' a horse that had never been beaten, $300 a side. Blue Bull beat him and was held in. Blue Bull could just beat any of them. He often beat old Legal Tender (sire of Red Cloud) at the fairs. I took him up to Loder's track, at Raleigh, Rush county, just to see what he could do. I sent him a mile, and Ike Loder

was in the stand and timed him. He went the last half in 1:01. I was telling about it at Indianapolis, and L. W. Moses, the 'spectacle man,' just put up $20 that it couldn't be done. I called up Loder, and Moses said Loder's word was sufficient and had the $20 paid to me. After Blue Bull's knee cap was broken he paced a half over Ike Loder's track in 1:04½.

"The day old John Brough was elected governor of Ohio we had a big race at Dayton. There were seven horses in the race. I had Blue Bull; Cooney, from Circleville, Ohio; Joe Ern, owned by Woodman, of Dayton; Pocahontas Girl, owned by Little Paul, of Fifth street, Cincinnati; Old Red Buck, owned by Sim Cord; Byram, owned by Joseph Miller, of Wabash, and I can't think of the other one. We were selling heats at $150. One time we scored an hour and twelve minutes. My brother Jim was betting on Red Buck. I said: 'Jim, Red Buck can't haul oats for my hoss.' The second heat Blue Bull won in 2:27 and Red Buck was distanced, although I did not want it done.

"The race was won by Blue Bull, and was finished after dark. Blue Bull was seven years old. I sold a half interest in him to brother Jim for $500 that day.

"Yes, sir, Blue Bull was the greatest horse that ever lived. The trouble was he did not have millions to back him like horses have nowadays. That has a heap to do with it." D. L. THOMAS.

Rushville, Ind."

Facts About a High Jumper.

EDITOR OF THE MONTHLY:

I have been reading your valuable journal since my return home from my summer campaign, and am surprised that you seem anxious to do away with high jumping at expositions and as an attraction for places of amusement.

To be sure Mr. Pepper had bad luck with his riders and horses at the Fat Stock Show in Chicago in November last, but because one person has his misfortunes in that direction, it is no reason that high jumping should not be allowed.

Say, for instance, the trotter goes lame, runs away, breaks a leg or drops dead during the mile, the public is not going to stop the trotters.

In one of the papers I read that the falling of horses and sprawling of men was the order of the day at Madison Square Garden at the Horse Show in 1891. I do not blame the horse for this; because a man or woman can ride a horse across country, over fence or ditch, it does not qualify the rider to go over high bars at seven feet or more, and if they undertake it they must expect a fall. I think where the greatest mistake is made in riding over the high jumps, is that they do not allow the horse to use his own judgment. There they take the horse back three times the distance from the jump they should, head him for the jump, and using whips and spurs with all the force they can, he reaches the jump at a race-horse clip and is under such headway and so anxious to get away from the punishment that he has no time to gauge himself and measure his take off. Then if he falls they blame the horse.

I am the owner of the celebrated high-jumping horse, Filemaker. I purchased him in the latter part of September, 1890, of a Mr. Lewis, of Chester, Pa. He was sunburnt and very thin in flesh, and in fact I thought him the worst looking horse I ever saw. And such a temper! He had the reputation of being a bad horse wherever he was known, and every one said I would never be able to ride him. In fact he took every one for his enemy and was looking for war all the time. But I began with patience and kindness, and yet it was a long time before I could make him understand that I was his friend, and even now, at times, when he gets nervous he shows some of his old temper; but if I stop him still and talk to him, then start him, as a usual thing I am mistress of the day.

I commenced to ride Filemaker on the 9th day of April, 1891. I rode him every week, giving exhibitions until November 21, 1891. At Three Rivers, Mich., June 18, at their spring meeting, I rode him over the bars at seven feet three and three-fourths inches. I rode him several times during the season at seven feet two and one-half inches. At Taunton, Mass., October 7, I rode him over the bars

Digitized by Google

seven feet four and one-half inches, which gives us one inch higher than any horse ever jumped in public in the world. Then in Chicago, in November, at the Fat Stock Show, I rode him seven feet three and one-half inches. The weight that Filemaker carries when I ride him is 149 pounds, including myself, saddle, saddle-pad and bridle, and not to my knowledge has any other horse ever jumped seven feet and carried over 125 pounds; and when Tom Potter rode him in Chicago, November, 1890, at the Fat Stock Show, Filemaker then carried 168 pounds seven feet two and one-half inches.

My experience in riding over high jumps, is that it is necessary to handle the horse as quietly as possible to obtain best results, and not to take him back over thirty or forty feet. I never carry a whip or use a spur on Filemaker. I can carry a whip until the jump is six feet, then he gets nervous and I do away with the whip. If he goes slow he measures his take-off and is more sure of a good raise and uses more judgment than when he rushes.

One more essential thing about these exhibition jumps. I think the iron pins used to hold the bars should be straight, set in the upright slanting up a little. The bar should be a three and one-half inch bar, white wood or pine, so that it will break if held on with the straps.

I have Filemaker here at my winter quarters. I keep him up nights and turn him in the paddock day times. He stands seventeen hands and one inch high, weight 1,370 pounds, and feels like a colt, and I believe he is as capable of carrying heavy weight across country as any horse living and with as few mistakes. He is not as pretty a horse as a great many, but he shows good breeding and he is not the crabbed, sour-tempered, sunburnt old horse that he was when I bought him and he was afraid of his life. I love the old fellow for the way he has carried me over the bars, and I believe it will be many a day before another horse and rider equals us in our "championship of the world."

MADAME MARANTETTE.

Mendon, Mich , February 15, 1892.

Pacers' Standard.

I WAS tempted to write "Tempest in a Tea-Pot," as the head for this essay, but came to the conclusion that there was little question that some of the writers on this turbulent topic imagine that it was a huge lake, an inland sea or maybe a veritable ocean which they were stirring into big billows. They may possibly be right in their view and I a long way out of the way in mine, and therefore will compromise by the caption adopted.

In comparison with other mooted questions I regard the admission of 2:25 pacers to the Trotting Register and with standard rank granted them on that condition, provided the applicant is a mare or gelding, and with further qualifications if a stallion, as of little moment. The idea which originally prevailed in the minds of a number of objectors was that it made standard trotters out of horses that had no pretensions to trotting rank either by inheritance or performance. As I understand it, the revised standard is something analagous to the conditions which govern in the thoroughbred Stud Book, or to apply the proper title, *the* Stud Book, in admitting Arabs, Turks and Barbs to its pages. In the first volume of the English Stud Book they are given a part by themselves, although, of course, they figure in the pedigrees of nearly all that are included in the book. In the fourth volume of the American Stud Book are the two horses presented to General Grant by the sultan of Turkey, and some others, and the Keene Richards importations of Arabs in previous volumes. The get of Leopard or Linden Tree from a thoroughbred mare and the produce of Esna or Saieda by a thoroughbred horse, however obscure, would be as much entitled to a place as the foal I saw by the side of Miss Woodford which had the grand Salvator for a sire. Now the Arab can not *race* in the sense the word is used now, and the sons and daughters of Arabs, although the other side of the house may be of winning strains, can not race with any success against those which have kindred crosses further back, and consequently the breeders of

Digitized by Google

race horses and the purchasers of race horses will not breed or buy them. The late A. Keene Richards gave the Arabs a fair trial. They were selected with care by expert judges, and price was not questioned when the animal was satisfactory. I can not recall where the first progeny gained even the shadow of distinction, and without taking the trouble necessary to state authoritatively by a search through the stud books and racing calendars, am under the impression that Transylvania by imported Arab, Massoud, her dam Peytona, by Glencoe, was the most successful as a brood-mare. She was foaled in 1855 and had her first foal in 1860, and from that until 1879, when she "slipped" twins by her son, Limestone, she never missed. Nineteen living foals by such sires as imp. Knight of St. George, Lexington, imp. Mickey Free, War Dance and Melbourne Jr., and in 1872 and 1873 foals by Mambrino Patchen. Again trusting to memory I think that Limestone was her only representative which would be accorded a place as a race horse. Objectionable as a near cross of Arab would now be held, what injury has come from admission into the Stud Book? No demand has been made for excluding them, and if such had been made no attention would have been paid to it by the compiler. The admission did not lower the standing of others, thoroughbred did not lose its significance. In admitting Leopard, Linden Tree *et al.* not a word is written of their blood lines, not a sentence descriptive of performance. This is a stud book, recognized by every breeder of thoroughbreds and by the courts, notwithstanding the incorporation of that which is rated inferior, but the good sense of breeder and buyer leads them to discriminate—there are thoroughbreds and *thoroughbreds.*

Somewhat analogous is the term I used, and still there is a small portion of analogy when merit is compared. A few breeders of fast trotters stand on the same ground, when pacers are mentioned, as the breeders of race horses occupy anent the Arab. A large majority of trotting-horse breeders regard the blood in a measure desirable; quite a number who rate it very good; a few who claim that it has no superior, while the remainder extol it as the *ne plus ultra*, an indispensable element in establishing a very high rate of trotting speed. The objectors to admission to the standard under the present rule can be classed with the first division. If of as little account as the Arab, no one would advocate admission. Those who would exclude them from sentimental feelings, and those who do not care whether they are admitted or not, may be rated among the second class. The third would favor admission; the fourth advocate the cause of the pacer with enthusiasm, and the last argue that the pacer should "rank" all the others. There are reasonable grounds to justify any of these positions, excepting the first and the last. The only argument having weight enough to call it an argument, which the first could advance, would be that from a fast pacing sire or dam the progeny would be more apt to pace than to trot, and clinch that by saying, "I despise a pacer." An answer to that is that all the great sires of trotters, with the exception of Electioneer, have got quite a proportion of fast pacers, while Blue Bull, a pacer himself, stands well up with fifty-five trotters and eight pacers to his credit, the Year Book for 1890 being the authority. When the Year Book for 1891 is received, I will be able to make a better comparison, though it will not be out of place to state that among all the pacing and pacing-bred mares which had foals by Electioneer not one of them paced. The dam of his single pacer being by Thorndale, or a son of Edwin Forrest, her dam by Alexander's Abdallah. The course of tutorship at Palo Alto may have more influence in deciding the gait than inheritance. With the second class it is more of a matter of sentiment, and accordingly stand neutral while the war is going on.

The third division will be the corps I will join, and, therefore, give individual reasons for taking that position. It would evidently be beyond the bounds of a short essay to present even a small portion of the examples which the past has presented of the advantages of pacing strains in breeding fast trotters and the close analogy between the two gaits.

Restricting the field to California, and

Digitized by Google

there are abundant proofs of the value of pacing blood, and also of its relationship to trotting, as shown by readiness to exchange the lateral motion for a diagonal movement, and *vice versa*, the St. Clairs, Signals, Chieftains (Hiatoga) and others, especially the St. Clairs, have taken a good place in the trotting annals. There is little necessity for going to the records to substantiate that claim, and as I consider it of more importance to show the *close* relationship between trotting and pacing, when admission to standard rank is the issue, will present a few illustrations. Chieftain got Defiance, who paced in 2:17¾ and trotted in 2:24. Director got Direct, pacing 2:06, trotting 2:18. Steinway got Cricket, pacer, 2:10; Cæsar, pacer, 2:16½, and Charles Derby, trotter, 2:20. Sidney, however, presents such an array of *facts* to support the position that it will be superfluous to offer further testimony. From the same mare he got Adonis, pacer, 2:11½, Cupid, trotter, 2:19, both race records. From the same mare he gets Faustino, trotter, 2:14¾, at three years of age, Fausta, pacer, 2:22¾, when a yearling. He shows the champion yearling trotter, Frou-Frou, 2:25¼, and from the breeding of their dams, who would have thought or dreamed that that should be the result? Frou-Frou, with a lot of Flaxtail blood, the dam of Fausta by Crown Point, a square trotter and "trotting-bred," and the next dam by A. W. Richmond. And now there is another puzzle. I brought Richmond to California, knew him from the time he suckled his dam, and am also familiar with many of his near relations on both sides, and never knew one to pace at either a slow or fast gait. All of his known blood was thoroughbred with the exception of the sire of his second dam, her breeder calling it Arabian, as was the custom in some parts of the country to designate a breed of peculiarly marked horses, while farther south Opelousas was the name. Richmond was a square trotter when free from lameness, and his sister, Nourmahal, had as perfect trotting action as I have ever observed. Richmond was bred to a mare three-quarters thoroughbred, and then came Arrow, pacer, 2:13¼, and Elwood, pacer, 2:17¾. From Gretchen, Richmond got Romero, trotter, 2:19½, and Gretchen's great grandson is Rupee, pacer, 2:14¾, by Guy Wilkes. The Chieftain mare, Daisy, was bred to Nutwood, the produce Mt. Vernon, trotter, 2:18; bred to a son of Nutwood, Hawthorne, and then came a two-year-old, Chief Thorne, which paced in 2:20. To these could be added many illustrations, but these I trust will be sufficient, and pondering over them, and cogitate examples, come to the conclusion that pacing and trotting are so nearly allied that a slight variation in the conditions when the foal is in embryo, or even prior to that time, one of the spermatozoa when nourished by the ovum, the basis to form the pacer, the next minute particle under the same influence takes the nearly allied type. Whether the influence rests with the male or female is difficult to determine, but I am inclined to the belief that in some cases the sire preponderates, in others, the dam.

There may have been such a preponderance of the trotting spermatozoa in the case of Electioneer, that whatever the envelope might be, it could not be overcome, while in Sidney they are equally divided. In Tom Hal, Tempest and others, the trotting germ is not found, judging from the data found in the Year Book. The gift to trot and pace fast, as exemplified by Direct under this view, might come from the male germ and the ovum, exerting almost the same influence, so that there was nearly an equal balance.

Rather too fanciful to be of any practical benefit are theories which are based on suppositions, and I am free to confess that my knowledge of the mysteries of reproduction is far too slight to build even a theory upon. Very fortunate, however, that nature has hidden her inner workings behind a screen, which will never be penetrated, but so far as this question is concerned, it is sufficient to know that pacing and trotting movements are so intimately connected that either may predominate, and that there is not a single family of trotters which can be depended upon to reproduce that action with absolute certainty. It is also admitted that education is a potent factor, and the time may not be far away when the science of teaching will be so far

Digitized by Google

advanced that the change from pacing to trotting or from trotting to pacing will be readily accomplished. Direct could be *forced* to trot, heavy shoes, weights, etc., being the means employed. The incumbrance to natural action and the evils following disgusted the pupil, and when that was removed, back he went to the manner of progression that *was natural.* Had he been educated at Palo Alto, his first lessons on a small circle, with the "footing" so deep that pacing was out of the question, the bias might have been overcome. But few will deny that a trotting record of 2:12 would have failed to give the distinction he has won by taking the first place in the pacing world.

What great injury comes from the admission of 2:25 pacers to the standard? The standard is debased, cries one; there is no standard, is the reply of the other. When a strain is admitted to the Stud Book, which is universally admitted to be inferior, it does not depreciate the blood of those who are far removed from the objectionable class. Why should it follow that a good mixture should prove so detrimental? For myself, I should greatly prefer a mare to breed fast trotters from that had paced in 2:25—especially if that record had been made in a "hotly-contested race," from one of equally good form, that could not trot if even she had seven or seventeen classes of standard blood. Individual merit is my choice, and all the glamourie of royal ancestry does not weaken it. No one who has greater respect for birth and breeding in man or horse, provided man or animal sustains the position birth *should* give, but when there is papable degeneration, throw it out and use another strain.

But in following analogies, which are found in the ranks of both divisions of fast light harness horses, one must not lose sight of another resemblance still closer, if possible, than is shown by the above mentioned characteristics. If in the prodigious numbers of spermatozoa, one spermtazoid will form the nucleus for the pacer, and the adjacent germ the foundation of the trotter, or, in compound instances, when both proclivities are inherited, and that so nearly balanced that the bias in either direction can be easily overcome, the laws—rules which govern trotters and pacers—are identical. Everything alike. Rearing, training, management in races, artificial appliances to correct the action, every strap in the harness, every point of the vehicle absolutely the same. Uses the same. While a large proportion of "road-drivers" favor the trotter, fashion has a good deal to do in establishing the preference. "Before the war," in many of the Southern cities, New Orleans especially, pacers were all the rage, and one of the most successful livery stable proprietors in the last named city, told me that the fast pacers in his stable were in more demand by those who hired horses than in his fast trotters, and that they were readier of sale at equal prices. That was in 1859, not long after the days when Pocahontas, Hero, Silvertail, Dolly Spanker and others were delighting race-goers with their flights of speed and keenly-contested races. There is a good deal of prejudice and not a little sentiment in denouncing pacers as unfit for the road, and it strikes me that there is "a right smart" share of these feelings which prompt exclusion from the standard, or rather which lead advocates in the direction of exclusion. While an "overwhelming majority," as they term it in politics, may be in favor of trotters for road-horses, when actual racing is the measuring-rod there is not nearly so many objections. Marvin might look out of place behind a pacer. Goldsmith drives Hazel Wilkes, Una Wilkes, Rupee and Allanah with the same degree of fervor, and Hickok brings his whole energy to bear, whether it is one of his fast trotters he urges to victory or the speedy and game Adonis he cheers to the front. It may have been fancy, but I thought there was a deeper glow on the cheek, a brighter sparkle in the eye of George Starr when "Direct's" name was mentioned in offering him congratulations on his return from the campaign of 1891, and notwithstanding that Vic H. and Little Albert had done wondrously well, the pacer was his pride, and it is the longest kind of odds that Mr. Salisbury shared in that feeling. The bulk of the spectators which throng the tracks, when big events are to come

Digitized by Google

off, are more interesting in exciting battles and rapid and close finishes than the gait which accompanies the strife, and it is fairly safe to assert that Direct and Hal Pointer would bring nearly as many people together as the champions of the trotting division.

So far as I have seen published, the argument advanced adverse to the admission of 2:25 pacers into the standard is, that the standard would be lowered, but on what ground that opinion is founded has not been clearly demonstrated. It can not be on that of numbers, as there will be such an overwhelming majority of *diagonalities* that the *lateralists* will be in a "hopeless minority," hundreds against thousands when the computation is made. The argument, if such it can be called, which ascribes a lowering of prices at auction sales to the admission of pacers into the standard, does not require much consideration to warrant dismissing it without reply. Just as reasonable to say that Arion would *not* have brought $125,000, his brother $25,000 at auction, nor $25,000 paid for the brother to St. Bel and the $75,000 refused for Advertiser if pacers had been kept out of the fold.

Should the admission of pacers prove so disastrous to the trotting interests, and the denunciations of that course be justified by future results, then the business of breeding and raising trotters stands on a precarious foundation, liable to be overturned by a tremor.

When Mr. Wallace separated the two families, heretofore united in the Year Book, I thought well of the change. Since this agitation I cordially agree with the editor of the *Kentucky Stock Farm* that it is far more convenient to follow the old plan. When comparisons have to be made there is the additional trouble of going from one department of the book to the other, and if there were two registers and two year books that would be increased, and at an increased expenditure for two books in place of one. The convenience for reference which the former plan affords will be granted by everyone who has to "go to the books" for information. In Vol. V, Y. B. 1889, page 391, Nutwood is found, and his "list" at the close of that is twenty-seven trotters, four pacers; on the next page Onward, twenty one trotters, three pacers; page 335 has Blue Bull, fifty-four trotters, five pacers, and owing to the names being arranged alphabetically, there is little delay or hindrance in the search. In Vol. VI, 1890 Y. B., page 407, Blue Bull stands fifty-five trotters, nothing to suggest that he ever got a pacer, on the page; page 470 Nutwood is shown with forty-four trotters, and on pages 471 and 472 Onward with twenty-eight trotters, in both volumes the caption "The Great Table." Following that division are "Table of Sires of Dams," "Table of Great Brood-mares," "Table of Champion Trotters," "Table of Fastest Records," "Fastest Records at Different Decades since 1800," "Alphabetical List of 2:30 pacers to close of 1890," and then "Table of 2:30 Pacers Under Their Sires (corresponding with Great Table);" page 571, Blue Bull appears with eight pacers; page 578 Nutwood seven pacers, and on the same page Onward four pacers. This is sufficient to prove that the search for data to make comparisons is simplified when the old system prevails.

I have no hesitation to assert that if anyone, no matter what his impressions may have heretofore been, will give close study to the breeding of light-harness horses, the history of light-harness sport, he will come to the conclusion that the admission of 2:25 pacers to standard rank was wisely ordered, and though it may be very difficult to surrender positions which have been strengthened and sustained by previous arguments, oral and written, candor will compel acquiescence in the decree.—JOS. CAIRN SIMPSON, *in Breeder and Sportsman.*

How the Sires are Wintered—Continued.

THE CARE AND EXERCISE GIVEN THE FAMOUS HORSE RED WILKES.

LEXINGTON, KY., February 7.

TO THE EDITOR OF THE MONTHLY:

With the exception of the breeding season our management of Red Wilkes varies but little throughout the year. He is kept in a strongly-built, well-finished frame box-stall, twenty-three feet square,

Digitized by Google

which has large sash windows on all four sides, with ventilating shaft and cupola in center of roof, thus having every provision for plenty of light and fresh air, and by means of which an even, regular temperature is maintained, according to season.

This stall stands by itself, entirely away from other buildings, in an elevated spot, and is protected from heat of the sun, snow and driving rain by a shed twelve feet wide, running all around on the outside. Its flooring is of stout oak plank, the interspace between which and the ground is aired thoroughly by a current passing through ventilators specially built for that purpose. We feed him six quarts of the very best oats daily, divided into three meals; three times a week the last one of the day is mixed with an equal quantity of bran, scalded up and well cooked and given as a mash. He has regular access to salt and a pail of fresh water in his stall all the time. Every night he has also an armful of the best timothy hay to pick over. During the winter he is ridden twice daily by a light-weight colored boy around a large paddock for upwards of an hour each time. In the summer he is turned to graze in a grassy paddock for two or three hours early in the morning as well. Our season with him commences in the early part of March and extends to the latter part of August, during which period he covers from forty to fifty mares. The services are as far apart as possible, and usually in the evening, particularly in hot weather. As with most horses of easy lymphatic temperament, he is a trifle slow at evening, so is never hurried at his work. He makes a vigorous and effectual cover, and is very sure.

Red Wilkes is a very hardy horse, and is never blanketed at any time of the year. During the time he has been at Highland Farm—since October, 1886,—he has not missed a meal, and though daily inspected by our veterinarian, Dr. W. F. Smith, no occasion has yet arisen for a single dose of medicine, being a perfectly sound horse, of such excellent vigor and constitution—which, by the way, he imparts to all his offspring. We consider "Old Red" good for many years to come. He is bedded with rye straw, and wears no shoes, having a stout, strong, natural foot, which is kept evenly trimmed from time to time, as may be necessary. Of course he has quite a big number of visitors, and is a big attraction to all lovers of the trotting horse. Red Wilkes is one of the most gentle and amiably-disposed stallions we know of—a trait particularly transmitted to all his produce. He has for companions in his stall two little dogs, to whom he is much attached. W. C. France & Sons.

HOW HAMBLETONIAN WILKES IS KEPT.

Chicago, Feb. 24, 1892.

Editor of the Monthly:

As to how Hambletonian Wilkes 1679 is treated in and out of stud season will say: His stall and the breeding pen are separated from the other stables, being enclosed in a three acre paddock by a six-foot tight board fence. In this paddock Hambletonian Wilkes is turned out during the late fall and early winter on pleasant days for from four to six hours, as the weather permits. In the paddock there is plenty of fresh water and salt at all times. The stall is 20x30 feet. There are two windows on the east side and two on the west side of the barn, ten feet from the floor (which is plank) and a cupola in the center of the roof, so that he has plenty of fresh air without a draft touching him when the windows are open. He runs in the paddock until February 1., when we commence jogging him previous to doing stud duty. which begins about March 1st. He gets about five miles a day to start on, and gradually increases until he gets ten miles a day. When the warm weather comes he is jogged briskly twice a week and scraped out. He is jogged in the early part of the day and serves the mare in the evening. He is limited to one mare a day. His feed consists of good oats, timothy hay, plenty of bran and carrots during the winter, and oats and plenty of grass during the summer. The yearlings at the farm by him are a strong substantial lot, and a visit to the farm will show that by the above usage he has got a very large percentage of the mares with foal that were bred last year. We have one man to take care of him and try mares. The mares are tried once a

Digitized by Google

week for six weeks after service. Of course there are mares sent to Hambletonian Wilkes with directions from the owners as to when and how often to breed them while in season. With these mares we always go according to owner's directions if possible. Yours truly,

W. P. MALONEY,

Supt. Murphy's Stock Farm, Park Ridge, Ill.

ALCAZAR 2:20¼ EXERCISES HIMSELF IN THE WINTER—A SURE FOAL GETTER.

TRUESDELL, WIS., Feb. 18, 1892.

EDITOR OF THE MONTHLY:

Replying to yours of a few days ago regarding the way Alcazar is kept, I will, in as brief a space as possible, tell of the daily routine of his life.

He is housed in a fire-proof building called "Alcazar's barn." This building is 40x40 feet. It is built and finished as well as a dwelling-house, covered with galvanized iron, shingled with iron shingles, finished inside with hardwood, and also provides a sleeping room for a man.

The horse's box is 30x40 feet, with high ceiling and ventilator in the ceiling. The windows are high and are so arranged that they can all be opened and no draft fall on the horse. Adjoining the barn is a paddock 40x100 feet, with high, tight fence. This paddock is filled one foot deep with tan-bark and cinders. The door is left open, and Alcazar goes in and out at will. He is always busy walking or trotting around the paddock, therefore, takes plenty of exercise.

The 1st of March he will be driven about ten miles daily, on the road or track. Two or three times a week in summer he is brushed along a quarter. His food in winter consists of a small quantity of oats, hay, bran and apples. In mare season he is fed ten quarts of oats, hay and all the grass he will eat. Alcazar is about the surest foal getter I ever saw. Last season he served sixty-two mares, getting fifty-eight of them with foal and his foals are all very strong and sound. I see he is the first horse to put a colt in the 2:30 list in 1892.

HENRY LAUGHLIN.

I have no desire to respond at any length to Mr. Wallace's last letter, on the pedigree of Sunol's grandam. In that letter Mr. Wallace states that he had asked me whether or not the words "Keenon Mare" in the Welsh-Swigert contract were in the handwriting of Mr. Swigert. My knowledge of Mr. Swigert's handwriting is based entirely upon an inspection of the two copies of this contract, one found in the possession of Anderson's administrator in California and the other found in the hands of the representatives of Mr. Swigert in Kentucky. The handwriting, however, is very peculiar and could not easily be mistaken for any other. Every word of each copy of the contract, excepting the signatures of Welsh and the witnesses, are in the same handwriting, which I do not entertain the shadow of a doubt is Mr. Swigert's. Of course this includes the words "Keenon Mare" in each copy of the contract.

The other matters discussed by Mr. Wallace in his last letter do not appear to me to have any special relevancy to the question at issue, and I do not care to take the time of the reader in replying to them. Jim Eoff may have been a very bad man, and may have played any number of smart games, but whether he did or not does not, in my judgment, very greatly affect the merits of the present controversy. I think that with the unbiased reader, who has carefully perused the testimony which I have offered, there can now be very little doubt that the second dam of Sunol was by Lexington, out of the "Keenon Mare" by Brawner's Eclipse. Except for the purpose of ascertaining and establishing the truth, it is not very material whether this particular animal was the grandam of Sunol or not. It is admitted even by Mr. Wallace, I believe, that she was probably "running bred." It is not part of my system of discussion to deny facts. If I can not account for them satisfactorily, so much the worse for my theories. I have, therefore, no disposition to throw any doubt upon Sunol's pedigree. It sometimes has happened that one or two crosses of first-rate trotting-blood has been sufficient to make a great trotter.

—*Iconoclast in Kentucky Stock Farm.*

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1888, '89, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00

Packer, The Bogie Man.

THE spectacle of a small boy with a jack o' lantern, endeavoring to terrify older and wiser people than himself on a dark night is about what the antics of Secretary Packer of the National Association of Trotting Horse Breeders amount to in his present will-o-the wisp dance behind the skeleton of the stud book that came into existence in New York the other day.

As a Bogie man Mr. Packer is not a success. Nobody is in the slightest degree deceived or alarmed by his candle-in-the-pumpkin demonstration. The whole affair is so shadowy as to not deserve serious attention. In the first place, there is no such thing as a "National Trotting Stud Book of America Association," and, therefore, it could not tender to the "voluntary" organization known as the National Association of Trotting Horse Breeders supervisory control of registration in its proposed bargain-counter stud book. It is also a fact, and a very siginificant one, that not more than four members of the executive committee of the last-named association took any part in the recent proceedings in New York, whereby it was attempted to give the latest stud book bantling a conveniently accessible godfather, and even this quartet sang its song in a very wobbly manner indeed, not once striking the key-note of intelligent action. This, however, is not surprising, as the four gentlemen who are endeavoring to amuse the public with a double song-and-dance which has evidently been insufficiently rehearsed, have not even the backing of the extremely limited membership of the National Association of Trotting Horse Breeders. Even those who are still by courtesy members of that organization, take no interest in the concern, know nothing of the actions of their executive committee, and care less.

The situation is really a most ridiculous one. Here are four men, not one of whom is a breeder of trotting horses, who get together like the historical tailors of Tooley street, shake hands all around, agree that they are the people, and then lend their supposititious endorsement to a mythical stud book for the purpose of supervising the registration of animals belonging to thousands of breeders, many of whom have hundreds of thousands of dollars invested in trotting-bred horses. This being done, Mr. Packer, proprietor of the celebrated Moonshine Farm, situated in the beautiful valley of Nowhere, is sent out with his jack-o-lantern, which he bobs up and down vigorously in the dark, meanwhile imitating the weird notes of a screech-owl with the idea that sombody is going to be thrown into convulsions of terror by his performance.

It won't do. Mr. Packer's committee of four can "endorse" things until it is black in the face if it has a notion to, but no serious attention will be paid to its actions by the breeders of trotting horses.

Trotting-Bred Mares Lead.

THE overwhelming superiority of Electioneer as a sire of 2:30 speed from dams of all sorts of breeding is now so thoroughly established that there is no question as to the prepotency of the dead California stallion. No other trotting stallion ever had such varied opportunities in the breeding ranks as were afforded Electioneer by reason of his becoming the property of Senator Stanford. That

Digitized by Google

gentleman, in addition to having given a great deal of attention to the theories of breeding, was also from his youth a practical horseman of no mean pretensions, and when to these qualifications was added the possession of practically limitless wealth and the ambition to excel as a breeder of light-harness horses it will be seen that Electioneer during his lifetime was fortunate in other directions than that represented by his undoubted individual excellence. Not only did Electioneer get a fair percentage of trotting speed from mares of radically different blood lines, but also in nearly every instance produced at least one or more representatives with extreme speed—the standard in that respect being placed at 2:15. From the thoroughbred mare Dame Winnie he sired Palo Alto, 2:08¾. From a mare half thoroughbred came Sunol, 2:08¼. From the trotting-bred mare Manette he sired Arion, 2:10¾, as a two-year-old, the greatest trotting phenomenon ever seen; while from a mare with a considerable portion of pacing blood in her veins Electioneer sired Manzanita, the champion four-year-old of her day, with a record of 2:16, and Wildflower, whose two-year-old mark of 2:21 stood unchallenged for seven seasons.

In view of this remarkable showing of Electioneer as a sire of great prepotency, irrespective of the blood-lines of the dams of his trotters, it is interesting to place the facts in such shape that their bearing on the general breeding problem will be readily seen, and with this idea in mind, the ten fastest trotters by Electioneer out of each of the classes of mares mentioned above are herewith grouped; the record of each, the age at which said record was made, and the average record and age of the ten being given. Under this method of getting at the facts we find that the fastest ten trotters by Electioneer from strictly thoroughbred dams are are follows:

Palo Alto (9)	2:08¾	Aldeana (9)	2:25
Ansel (7)	2:20	Emaline (5)	2:27½
Azmoor (7)	2:20½	Hugo (4)	2:27½
Express (7)	2:21	Whips (8)	2:27½
Gertrude Russell (5)	2:23	Cubic (5)	2:28½

Average record, 2:23.

Average age of performers, 6 6-10 years.

From half-thoroughbred mares Electioneer's fastest ten trotters are:

Sunol (5)	2:08¼	Antevolo (4)	2:19½
Anteeo (6)	2:16¼	Cecilian (2)	2:22
Amigo (6)	2:16¾	Truman (3)	2:22
Electricity (7)	2:17¾	Susette (7)	2:23½
Suisun (6)	2:18½	Coral (3)	2:25

Average record, 2:19.

Average age, 4 9-10 years.

The fastest ten trotters got by Electioneer from trotting-bred mares are:

Arion (2)	2:10¾	Norval (7)	2:17½
Advertiser (3)	2:16	Mont Rose (3)	2:18
Adair (7)	2:17¼	Bell Boy (3)	2:19¼
Campbell's Electioneer (5)	2:17¾	Hinda Rose (3)	2:19½
		Del Mar (4)	2:20
Lot Slocum (6)	2:17½		

Average record, 2:18.

Average age, 4 3-10 years.

The fastest ten from pacing mares are:

Manzanita (4)	2:16	Fred Crocker (2)	2:25¼
Ladywell (5)	2:16½	Aleck B. (9)	2:25¾
Bonita (7)	2:18½	Lucyneer (3)	2:27½
Wildflower (2)	2:21	Pomona (6)	2:28¼
Fay (11)	2:25	Alma (7)	2:28½

Average record, 2:23¼.

Average age, 5 6-10 years.

To recapitulate the facts in the case, which are certainly very interesting and ought to be remarkably instructive to people who take an interest in such matters, it may be said that in brief the showing is as follows, the trotting-bred mares having a great deal the best of it both in respect to the average record of their ten fastest trotters by Electioneer, and also as to the age at which these trotters made their best records:

Dams.	Av. rec.	Average age.
Trotting-bred	2:18	4 3-10 years.
Half thoroughbred	2:19	4 9-10 years.
Thoroughbred	2:23	6 6-10 years.
Pacing	2:23¼	5 6-10 years.

It will be noticed that trotting-bred mares in every particular which is taken notice of by this tabulation are ahead of all others, having produced the greatest average rate of speed, and also accomplished this at the earliest age by their sons and daughters, next to them coming the half thoroughbred mares, then those strictly thoroughbred, and last the pacing-bred mares, although the pacing dams beat the thoroughbred matrons a little as to the average age at which their trotters by Electioneer became standard by performance. In other words the ten best trotters by Electioneer out of trotting-bred mares had an average speed of 2:18, and reached their best records at an average age of four and three-tenths years, while the others are quite a distance behind them in all respects.

It should not be forgotten, however, that Electioneer's fastest trotter, Sunol, is out of a half thoroughbred mare, and that his next fastest, Palo Alto, is from a strictly thoroughbred mare. But to offset this show-

Digitized by Google

ing comes Arion, a representative of the trotting-bred mares, with his unparalleled record of 2:10¾ as a two-year old, which is unquestionably a greater performance than the 2:08¼ of Sunol at five years of age, or the 2:08¾ of Palo Alto when nine years old. Therefore it can not truthfully be said that in respect of producing extreme speed the thoroughbred or half-thoroughbred mares have shown themselves thus far in any way the superior of the trotting-bred mares, unless one undertakes to argue that the records of Sunol and Palo Alto as aged horses are better than that of Arion as a baby. Another point that does not appear in the above tabulation is the fact that Electioneer's one yearling trotter that has beaten 2:30 is out of the intensely trotting-bred mare Beautiful Bells, and this is certainly worthy of presentation and consideration, because only four horses in the world have sired yearlings with trotting records better than 2:30, they being Sidney, Electioneer, Matadon and Sable Wilkes, and in each instance it is a significant fact that the dams of these yearling 2:30 performers were trotting-bred mares. It will be readily enough conceded by those who have given the breeding problem attention and study, that in the matter of getting speed from all classes of mares irrespective of their blood lines Electioneer has never had an equal, inasmuch as he stands far above any other horse as a sire of 2:30 speed, having now 99 trotters in the list, and as he also has more than ten from each of the classes of mares mentioned above the comparison that has been made is a fair one, because with ten examples in each class it is evident that there can be no juggling of facts or figures to fit any particular theory. The result is a plain enough showing to the effect that no matter from what standpoint the observation is made, Electioneer has done better with trotting-bred mares than with those of any other blood lines, both as regards average speed production and age at which the 2:30 limit was reached or passed.

Hambletonian Blood in Pacers.

News comes from New York that the pacer, Goldleaf, a daughter of Sidney, that made a record of 2:11¼ as a four-year-old, is to be bred to Direct, whose record of 2:06 is the best to the credit of a pacer. Mr. Shults, who owns Goldleaf, is one of the modern school of breeders who believe that horses are not likely to impart to their progeny a quality that they themselves do not possess to any marked extent, and therefore, except when buying animals whose lack of age is reason enough for their not having been trained, he demands a certificate of merit in the shape of properly attested speed. Following naturally in this same line of thought, it is the theory and practice of Mr. Shults that the mating of fast animals is more likely to result in the production of speed than a mare and stallion neither of whom had shown extra capacity in the desired direction, would accomplish. It is reasoning on this line that he proposes to breed Goldleaf to Direct, and while the wisdom of uniting the blood of two such remarkable pacing performers is so apparent as to need no comment, it is worthy of note that both Direct and Goldleaf are, with the exception of one strain which comes through the dam of the mare, almost entirely free from pacing blood. Direct is by the trotter, Director, 2:17; he in turn by Dictator (brother to Dexter, 2:17¼), and out of the famous Mambrino Chief mare, that has three sons and one daughter in the 2:30 list, their average record being 2:21½. The dam of Direct is the trotting mare, Echora, 2:23½; she by Echo, a son of Hambletonian, and as Dictator, the grandsire of Direct, is also a son of Hambletonian, it will be seen that Direct traces on both sides of his pedigree to the founder of the greatest trotting family the world has ever known. Naturally enough with this sort of breeding Direct had trotting speed, as his record of 2:18¼, made at that way of going when four years old, is ample attestation, but in spite of his breeding he took of his own accord to the pace, and, as everybody knows, eclipsed all records made in races or otherwise. Goldleaf, so far as her sire is concerned, inherits a lot of trotting blood, the crosses being piled one on top of another in profusion, and more than this the strains are pretty much all of the performing variety, as her sire, Sidney, is by Santa Claus, 2:17½; he by Strathmore; dam Sweetness, 2:21¼, by Volunteer; second dam by Edward Everett. Here is a horse sired by a grandson of Hambletonian, out of a daughter of Hambletonian, second dam by a son of Hambletonian, and yet Sidney, although a reasonably fast trotter when a colt, preferred the pacing gait and made his record of 2:19¾ as that way of going. He sires a lot of pacing speed, as well as some phenomenal colt trotters, and this versatility in the matter of getting different styles of speed could never be better illus-

Digitized by Google

trated than by the fact that last fall two of his get captured the yearling record for both trotters and pacers with respective marks of 2:25¼ and 2:22¾, added to which is the further fact that the baby which set the yearling pacing mark at 2:22¾ had only a couple of weeks previously made a trotting record of 2:40, so that her performances as a yearling at both ways of going are unquestionably phenomenal, it requiring only the addition or subtraction of a little of the weight from her forward feet to make her assume either gait at will, and perform with far more than average speed for her age. The blood of Sidney and Flaxtail through such a phenomenally fast pacer as Goldleaf, united with that of Direct, which embraces in its current such strains as come from the lines of his pedigree noted above, will result in the production of a colt in which the preponderance of Hambletonian blood will be absolutely overwhelming, tracing as it does five times to "the old horse." There is something remarkable about the manner in which the Hambletonian blood will not infrequently produce pacers of the highest class as well as record-breaking trotters at all ages and ways of going. Just now there is considerable being said and written concerning the prepotency of the blood of the pacer, Flaxtail, which animal sired the dam of Goldleaf, and it would be manifestly unfair to ignore that horse in considering the marvelous speed of the daughter of Sidney at the pacing gait. But on the other hand it would be equally absurd to overlook the fact that Sidney himself, although trotting-bred, was a 2:19¾ pacer, which is a considerably faster record than Flaxtail could ever secure when at his best. The fact also that from other mares than the dam of Goldleaf Sidney has sired some phenomenal pacers is not to be set aside, and when the entire proposition is boiled down it resolves itself into an unusually clear and strong presentation of the greatness of the blood of Ryskyk's Hambletonian in producing pacers as well as trotters.

That Potent Margrave Blood.

MR. COVEY, who resides in California, has discovered that the excellence of a considerable number of well-known trotters and sires and dams of trotters comes from the fact that they are related through an ancestor who figures in the misty past to a thoroughbred horse called Margrave, that won the St. Leger in 1835 and was brought to this country two years later. It might strike some people that considering the infusions of other blood that have been necessary to make that of Margrave trot a little the chances were rather against the theory that the 1837 running horse was particularly potent in producing 1891 trotters, but the gentleman in California has apparently gone over these trifling obstacles much as a good steeple-chaser does a three-foot hurdle, and he lands safe and sound on the other side.

He says of Margrave: "His blood not only flows in the veins of the greatest trotting horse of the day, Palo Alto 2:08¾, but is also prominent in such sires of trotters as Alcantara, Alcyone, Hambrino, Edward Everett, Nephew and Whips, whose produce aggregate more than 100 2:30 performers. No arguments can refute the wisdom of the introduction of thoroughbred blood into the pedigree of the modern trotting horse, and the closer the union the more marvelous has been the result."

This is as refreshing as the dew of a June morning. But in spite of the fact that Mr. Covey has declared in advance that "no arguments can refute the wisdom of thoroughbred blood into the pedigree of the modern horse," he will perhaps not take it amiss if benighted individuals in other parts of the country than that whose wonderful climate has produced such a choice exotic in the way of an argumentative gentleman as himself make a few remarks on the subject concerning which he writes in such an *ex cathedra* manner.

The blood of Margrave, according to Mr. Covey, "is prominent in such sires of trotters as Alcantara, Alcyone, Hambrino, Edward Everett and Whips." Now let us see how much of actual cold-blooded truth there is in this statement concerning the "prominence" of Margrave blood in the veins of these well-known sires, and what proportion of the statement is the figment of an oriental imagination which makes rose leaves out of shavings. Beginning with Alcantara, it is found that this horse is a son of the trotter George Wilkes, record 2:22, which horse was sired by Rysdyk's Hambletonian and out of a mare by Henry Clay. It is on the female side of Alcantara's pedigree that the all-powerful grand old Margrave running blood that mysteriously makes trotters in 1892 on account of having produced a runner in 1835, comes in, and it doesn't come in remarkably soon at that, as this precious strain is derived through the second dam of Alma Mater, which latter

mare produced Alcantara. In other words Alcantara's great grandmother on his mother's side was sired by the 1837 running horse Margrave, which fact, according to the logic adopted by Mr. Covey, accounts for his trotting in 2:23 and becoming a great sire of trotters. It has already been related that the sire of Alcantara was a famous trotter with a record of 2:22, and it may also be mentioned in passing that the dam of Alcantara is by Mambrino Patchen, a horse that sired quite a number of 2:30 trotters and that was himself the brother of the famous Lady Thorne, whose record of 2:18¼ was not by any means the measure of her speed. Most people—that is most people who have not the sibyl-like faculty of peering into the past possessed by Mr. Covey, would in their hum-drum matter-of-fact way reach the conclusion that Alcantara trotted fast and early principally because his sire was a trotter with a record of 2:22 and his dam was sired by the brother of a 2:18¼ trotter, but of course they would be mistaken. The fact that the sire of Alcantara has also given the world about seventy-five other trotters and pacers with records of 2:30 or better, cuts no figure in the matter, although some people will doubtless fall into the error of imagining that it does. The further fact that Alcantara's dam was sired by a horse many of whose sons and daughters have trotted fast, must also not on any account be figured in when a person desires to know why Alcantara was a trotter and a sire of trotting speed. The way to solve the question is to hark back to Alcantara's great-grandmother. She was a horse that couldn't trot any but was a first-class runner, ergo, Alcantara is a trotter. It is all very easy and simple and beautiful and rose-colored when you come to find out how it is done.

As to Alcyone, what has been said regarding Alcantara will fit his case, he being a full brother to that horse. Hambrino is the next stallion that, according to Mr. Covey, derives his principal virtues as a trotter and sire of trotters from the Margrave blood in his veins. In this case the potent thoroughbred infusion comes in on both sides of the pedigree, Hambrino being by Edward Everett, a stallion that was sired by Rysdyk's Hambletonian, and whose dam is given in the books as "said to be by imp. Margrave." Of course a little thing like "said to be" doesn't stand in the way of such a beautiful cross-country thinker and arguefier as Mr. Covey, but the mere fact that according to the best authority nobody knows positively that Edward Everett has any Margrave blood at all in his veins would by some people be at least alluded to. Edward Everett has sired quite a lot of trotting speed, as have over a hundred other sons of Hambletonian. The general impression is that the Hambletonian blood is what made Edward Everett a sire of trotters, and this is a reasonable view of the situation, inasmuch as when the thing happens 110 times with different individuals it may be taken as indicative of a general tendency in that particular strain of blood to produce that particular result. Edward Everett, therefore, according to Mr. Covey, got trotters because his dam was said to be by imp. Margrave. This is certainly a powerful argument.

Nephew, another horse in Mr. Covey's galaxy of equines, who owe their eminence as trotting sires to the presence in their pedigree of Margrave blood, is a son of Hambrino, which horse, as has just been shown, was at best only "said to be" a grandson of Margrave in the paternal line. This is stretching the matter a little, to lug in a son of Hambrino on this "said to be," and it is hardly necessary to point out the fact to men of a reflective turn of mind that to Mr. Covey and his beautiful theory should be given credit for the fact that the grandam of Hambrino in the maternal line is by imp. Margrave, which fact, by the way, he seized upon as a basis for the statement that "Hambrino has a double cross of Margrave blood," again ringing in that "said to be" as an established fact.

Whips, the last stallion mentioned by Mr. Covey as an exponent of the idea that the Margrave blood is great in the production of trotters, is a son of Electioneer and out of the thoroughbred mare Lizzie Whips. It appears that the grandam of Lizzie Whips was by Margrave, so that Whips gets his infusion of this valuable strain through his great-grandmother. His mother was not only bred for a runner, but performed creditably at that gait before being taken to California after her purchase by Senator Stanford. Mated with the intensely trotting-bred stallion Electioneer, she produced Whips, that has a record of 2:27½, and Linnet, two-year-old record 2:29. Whips has sired a couple of 2:30 trotters. Inasmuch as Electioneer had at the close of 1891 a cool hundred with records of 2:30, or better, to his credit and as a sire of early speed has never been approached, hav-

Digitized by Google

ing produced a yearling trotter with a record of 2:26¼; a two-year-old with a record of 2:10¾; a three-year-old with a record of 2:10½; a four-year-old with a record of 2:10½; a five-year-old with a record of 2:08¼, it might without any terrific effort of the imagination be thought by most people that it was his blood that made Whips a trotter and a sire of trotters, and not the blood of his great-grandmother, who was by Margrave, his grandmother, who was also a thoroughbred, or his mother, who was a successful performer on the running turf.

The Breeders are Drawing Out.

SINCE the publication of the new standards proposed by the secret committee meeting of the N. T. H. B. A., we have received several expressions of dissent from members of that association. They strongly deprecate the proposed action, and as a sample, the one published below is so thoroughly to the point that we think it will not only have a marked effect upon the members of the N. T. H. B. A., but will also rally breeders who have not yet done so to an active support of the American Trotting Register Association. This is emphatically the breeders' battle. It is against their interests to have two stud books, with the inevitable confusion which such a result would entail. The letter of Mr. S. C. Wells, a prominent breeder and proprietor of Dreamland Stock Farm, Le Roy, N. Y., is as follows:

"LE ROY, N. Y., Feb. 15.—*W. F. Redmond, Treasurer N. T. H. B. A., New York, N. Y.—Dear Sir:* Your notice of membership dues received. You can drop my name from the membership of the association for the following reasons: I do not approve of the course adopted by the executive committee in fathering an opposition trotting register. The members of the association have not been consulted, and I do not believe a majority will approve of a course so ruinous to their interests. The whole scheme is the invention of a few disappointed men, who are willing to act on the principle 'to rule or ruin.' It is a grave misfortune to the breeders that there are a few men who are not willing to submit to the large majority in a matter so vital to their interests and are bound on opposition, discord and confusion. One trotting register is ample enough, and let a majority of the breeders say what that shall be and then let us all support it heartily, loyally, and the financial interests of the breeder as a whole will be subserved. I may be the only member of your association who will take this view of the matter, but will be greatly disappointed if a majority of the members do not revolt against the movement.

"Yours truly,

"S. C. WELLS."

We are informed from an excellent source that the names of several prominent breeders, which have been used as in favor of the new scheme, have been used without their authority, and the signs are not wanting that this smallest of all the stud-book boomlets is already in a moribund state.—*Spirit of the Times.*

"CHICAGO, Feb, 20, 1892.—*W. F. Redmond, Esq., Treasurer N. T. H. B. Assn., P. O. Box, 516 New York.—Dear Sir:* I have yours of 1st inst. regarding dues. I wrote Secretary Packer some time ago that I understood the National Association of Trotting Horse Breeders were to start a new register, or have it done through their instrumentality. If such is the case, please present my resignation, as I could not consistently remain a member.

"Yours truly,"

[Signed] "F. S. GORTON."

FRANKLIN, VENANGO CO., PA., Feb. 24, 1892. *Mr. L. D. Packer, Secretary National Trotting Horse Breeders' Association, 1 Broadway, New York City.—My dear Sir:* Please present my resignation as a member of the Executive Committee to your board at its next sitting. The reasons impelling this resignation are known, doubtless, to you, but may be briefly stated as arising from the fact that the starting of an additional register is opposed to my interests as a breeder, and not to mine alone, but, in my judgment, to the interests also of the great mass of breeders. In any event, it is proper that any enterprise seeking success should be officered and directed by those in sympathy with the movement, and deeming, as I do, this movement unwise and destined to provoke conflict, it would be manifestly improper to embarrass your plans by remaining as a director in a company whose object is so contrary to my views of what constitutes "the highest good to the highest number." I have just emerged (with no great glory and some financial loss) from one conflict in behalf of a single register, and that one controlled by, and the property of all breeders. Hailing from the State of Pennsylvania, "I am a man of peace."

At this time, permit me to express, through

Digitized by Google

you, to all my associates on the board the highest esteem for their personal qualities and sincere devotion to their conception of the highest good to the breeders' interests—but from my standpoint a mistaken conception—and to close with the hope that they may yet see that those interests can be better served by the expenditure of their talents and energy in some other direction.

Very respectfully yours,

J. C. SIBLEY.

What Mr. Simpson Thinks.

IN this issue of the MONTHLY there appears an article from the pen of Wilfred Page, a California breeder, in which the action of the American Register Association directors, in admitting pacers to standard rank on the basis of a 2:25 performance is criticised at considerable length, and following the letter in question is an analysis and dissection of its statements. In the course of his elaboration of his views on the admission of the pacer Mr. Page undertakes to say in advance how the well-known breeder, turfman and writer, Mr. Joseph Cairn Simpson, of California, will view the subject. As it happens, it is possible for the editor of the MONTHLY to permit Mr. Simpson to speak for himself on this important point, which he does, in a letter from Oakland, Cal., under date of February 17. Says Mr. Simpson: "I have yet to find a man who, upon being questioned, did not admit that he would rather have a 2:25 pacing mare to breed fast trotters from than one standard-bred which could not trot, and I certainly would choose a fast pacer for a sire of trotters in preference to a trotting-bred trotter which could not trot—both untried. The last *Rural World* I saw had a very sensible editorial in relation to this question, and it is only a matter of time, not long at that, when the opposition will have to give way." Anent this subject of the admission of the pacer, we give place in another part of this issue to an article by Mr. Simpson, which appears in the current number of the *California Breeder and Sportsman*, in which paper Mr. Simpson conducts a most interesting department. In his consideration of the subject it will be noted that the California writer presents the matter in the light of logic and reason, stating facts to uphold the position he takes, and it will prove instructive reading, whether or not one is arrayed on either side of the subject at issue.

Don't Overtrain.

JAMES ROWE, a young man who as a boy was a jockey, and who, by reason of having a little different shape of head from the average youth who rides race horses, was able, when he reached man's estate to branch out as a trainer of thoroughbreds, in which field he has achieved marked success, recently contributed to an eastern turf journal a very interesting paper on the training and management of race horses.

From a perusal of what Mr. Rowe has to say on this subject, it appears that, like trotters, a good many of the fastest and most reliable thoroughbreds need but little training outside of their races. On this point, Mr. Rowe says: "I do not think it is well to ask too much of a horse in the way of trials before his races. He does not need much strong work, and a trainer frequently makes the mistake of having a horse run his race in his trials. Unless a horse is gross and sluggish, when he is raced twice a week he won't need much exercise beyond trotting and cantering."

These words can be read and pondered over with profit now that the season for training trotters is close at hand by a great many men, who during the next six months will have in their charge valuable horses for the purpose of developing the speed of such animals to the greatest possible extent. "Don't overtrain" should be painted in large letters on the front entrance to every driver's intellect, and if these two words were heeded by at least eight trainers out of every ten in the country there would be more fast records made by trotters than is now the case and a far less number of animals would be made cripples from injudicious work and speeding. Anyone who was familiar with the methods of training employed only fifteen or twenty years ago can see that at the present time a man who would go back to the ideas in vogue when Dan Mace, for instance, was in his prime, and Flora Temple, Dexter and Goldsmith Maid successively lowered the trotting record would not have much chance of success. Of course there are some drivers who are way behind the tail-end of the procession in this matter of training, but they have never amounted to anything, and never will. The day of constantly using the sweat hood, "working out" at least twice a week, jogging around the track from ten to fifteen miles every day and a long walk in the latter part of the afternoon has departed for good, and in its place we see rational treatment of the trotter—a system

Google

of moderate exercise calculated to bring out the highest flights of speed, the natural courage and ambition of the horse produced by breeding being relied upon to carry him through a succession of mile dashes called heats when the race day arrives. The most successful trainers of the present day are those who as a rule do not give their horses anything like the amount of work that would have, a dozen years ago, been deemed necessary, and even in the olden times it was noticeable that in many instances trotters made their best performances when, according to the old-fashioned ideas of how they should be prepared, they were "short of work." Instances innumerable showing where horses have gone the fastest miles of their lives when their drivers thought that on account of lack of training they could not possibly be at their best could be given, and it is safe to say that at the present time the average trotter does not receive over half the "training" that would have been given him had he been on earth fifteen or twenty years ago. It is seldom indeed that a horse suffers from too little training, whereas it is within the personal knowledge of everyone who has to do with the trotting turf that overtraining is an ever-present evil.

The Return of Foxhall.

THE American-bred stallion Foxhall, a son of King Alfonso that was taken to England something like ten years ago and that in his three-year-old form stamped himself not only as the best horse ever sent across the Atlantic from America, but also as the best one seen in England for many a decade, has been repurchased by Mr. J. R. Keene, who owned him at the time of his great performances on the turf, and is now on the ocean *en route* to this country. Foxhall's career as a race horse on the other side of the water was a gloriously triumphant one. He was of the same age as Iroquois, and the year the last-named American horse advertised himself and the place of his birth all over the world by winning the Derby and St. Leger, Foxhall, although his victories were in events of a less classic character than those of Iroquois, performed such prodigies in the way of weight carrying and speed as to stamp him infinitely the superior of any three-year-old in training in France or England, and that he was several pounds better than Iroquois was never doubted by intelligent turfmen who saw both of the American bred colts perform as three-year-olds. Foxhall was not entered in the great stakes which Iroquois won, and beginning early in the season he crossed the channel to France where the French Derby, technically known as The Grand Prize of Paris, fell to him so easily as to at once stamp the big son of King Alfonso as a race horse far above the common. Coming back to England, Foxhall won the Grand Duke Michael stakes at Ascot, and his victories later in the season in the Cesarewitch and Cambridgeshire handicaps were of such a remarkable character that he went into winter quarters eulogized the world over among horsemen and race critics as the greatest three-year-old that had ever looked through a bridle. In the two big handicaps of the fall racing season in England, Foxhall gave away weight to nearly every notable horse of his age in that country and some Derby winners of former years were behind him at the finish of those races. It was not deemed possible that the American colt could, after romping home in front of a large field in the Cesarewitch, possibly win the Cambridgeshire, as that race in its history of more than a hundred years had only once been captured by a three-year-old, that being in 1845. The horse in question carried forty pounds less than the weight at which Foxhall was in, and so confident were the bookmakers that the American colt had no chance in the Cambridgeshire that fifteen and twenty to one was freely laid against him at the post. But Foxhall won the race just the same, coming first past the post ahead of as fine and large a field of English thoroughbreds as had ever faced the starter, and some years after this in writing a book on the thoroughbred race horse the eminent English trainer John Day had no hesitation in saying that Foxhall was the best race horse he had ever seen. Coming from the source it did, this was praise of the highest order, and it warmed the cockles of every true American heart to read from the pen of an English trainer, a man who would naturally be prejudiced in favor of the horses which his own country produced, that our big bay colt outclassed the world. And this, too, in a year when another American race horse, and bearing a distinctively American name, Iroquois, had captured what Lord Disraeli long ago aptly denominated "the blue ribbon of the English turf." It was a great year for American horses in England, and the glory obtained through their prowess has never faded. Iro-

Digitized by Google

quois was brought back to this country by his owner, Mr. Pierre Lorillard, and is now at the head of the Bell Meade stud in Tennessee. Foxhall was purchased by an English nobleman, and in the breeding ranks has shown that the blood which bore him to the front in many a hard-fought race is still potent, as his sons and daughters have won their share of the races in which they started. Foxhall was named for Mr. Keene's son, and it is gratifying to note that one result of that young gentleman's trip to Europe is the repurchase and shipment to this country of a horse whose achievments reflected honor on this country in a field of endeavor that is open to the world.

Foxhall's breeding is thoroughly American, as in addition to being sired by a horse that was foaled in this country, he is out of a mare by Lexington, whose performances on the turf and the deeds of whose progeny did much to bring the American thoroughbred into good repute all over the civilized world. King Alfonzo, the sire of Foxhall, was got by Phaeton, a stallion that when owned in England was condemned as practically worthless by so high an authority as Admiral Rous, who was practically master of the English turf. It was mainly on account of this adverse verdict concerning him that Phaeton was practically expatriated, being sold for export to this country at a very small price. He proved himself, however, a great sire, and had he done nothing after reaching America other than getting Ten Broeck, who in his day lowered the records at one, two, three and four miles, Phaeton would have been a cheap horse at the price paid for him, but in addition to Ten Broeck, others of his get ran well, and King Alfonso has sired many other winners besides Foxhall.

Doble on a New Rule.

Budd Doble, looking even more youthful than usual with a newly started mustache in place of the familiar one of so many years' standing, felt pleased with himself and the world in general, as he sat in his office the other day and received the congratulations of some friends over his good fortune in securing Drextell, the brother to Axtell, for $7,500, at one of the recent Kentucky sales.

"Yes, I think it was a good buy," said Doble, "and yet, when I went to Lexington, I had not the slightest idea of bidding on Drextell, or for that matter, any other horse in the sale. The day I reached the Kentucky town, however, two or three people spoke to me about what a fine looking colt the brother to Axtell was, knowing that I would naturally be somewhat interested in him, owing to my having his brother with a 2:12 record as a three-year-old, in my stable. That evening I heard still more about Drextell, and on my return from a trip to one of the stock farms the following day, I resolved to take a look at him, and before going to bed that night, saw Russell Railey and asked him if he would go out in the morning with me and look at a colt. He agreed to do so, and when Drextell was led out for our inspection, Railey was immensely pleased with him, saying he was certainly a grand individual. I then told him what colt it was, and he said right away, 'You ought to bid on him.' I made up my mind that I would, and the next day at the sale mentioned the fact to Mr. S. A. Browne and asked him if he would bid for me. You remember that the first horse of the Williams consignment offered was Barnhart, and when Mr. Henry bid $15,000 for him the first crack it sort of stunned the people and there was not another offer on the horse. Before the crowd had got over its surprise Drextell was brought in and it was quite a little time before he was started, and even then there was not a great deal of competition, as Mr. Brown got him for me for $7,500. That night Williams, who evidently felt that the colt had gone for much less than his value, said to me that if he had not thought Drextell would sell for $20,000 or $25,000 he would not have brought him to Lexington. I shipped the colt to Terre Haute, and my brother Charlie, who is in charge of my horses there, is very much pleased with him, as indeed, is everybody who has seen him. He is about as handsome coated a horse as I ever saw, a solid bay in color, with black points, and yet his coat has a peculiar changeable quality, sometimes seen, so that by standing him in a certain light he looks to be a chestnut, while in another you would think he was a red sorrel. He is what I call a first-class individual.

"No, I shall not train him as a yearling, and for the matter of that he will not be asked to do anything in the way of racing as a two-year-old, as you know it has always been my idea that little good is accomplished and sometimes great harm done by trying to drive trotters a mile at the top of their speed before they are fully matured as to bone and muscle. If Drextell has speed as a two-year-old I shall prob-

Digitized by Google

ably let him brush along a little, if people want to see him go, but no campaigning or trotting races for me with a two-year-old colt. I bought this one to keep, not to sell, and if he makes a fast record it will be when he is four or five years old—that will be time enough for him. Of course, I know that in these days when colt trotters are the fashion, that in most cases it is better to sample a horse's speed, if he has any, as soon as possible, and I am handling colts for other people with the idea of making them go fast, just as soon as they are able to do so. As you know, I gave Monbars a two-year-old record of 2:18, which has been beaten by only one other trotter of that age. By the way, you may say if you like, that Monbars will not be in my stable this year, although I understand he is to be trained after making a season in the stud.

"You want to know my opinion of the rule passed at the recent Congress of the National Trotting Association, which provides that a driver shall be permitted to lay up only one heat in a race, and that he must give the judges notice before hand of his intended action? Well, I think it is a bad rule, a senseless one, and that it will not be possible to enforce it. What an absurdity for judges to undertake to tell me or any other competent driver that he shall, under penalty of punishment, try to win every heat in the race! There are dozens of times every season, when after taking the word with the intention of driving for the heat, a man is obliged from various causes, to change his mind and lay it up. His horse may make a break, some other horse may get off with such a lead that to attempt to overtake and beat him would be foolish, and there are dozens of other things liable to occur at any stage of the race that would make it the height of folly for some of the horses to be driven in a fruitless attempt to win. Perhaps a man could sometimes tell before-hand whether he wanted to lay up a heat or not, but it would not very often come that way, and if he notified the judges of his intention to lay up, as the new rule provides, of course he would be expected to carry out his statement, when, as a matter of fact, it might be possible, through other horses breaking, for him to win the heat that he had intended to not try for. The talk about protecting the people who bet on heats is well enough in its way, but look at the injustice that the new rule will work to drivers. I never bet a dollar on heats, and seldom have a bet on the result of a race. My interest lies in winning the purse money, in enhancing my own reputation by having my stable as successful as possible, and in adding to the value of horses driven by me and owned by other men. Would it be at all right for the judges to make me drive out a horse that had no chance to win a heat, thereby ruining his subsequent chances of success in the race, and perhaps lowering his market value by an injudicious drive under circumstances that would place the horse in a false light? That rule ought to be reconsidered and abolished. It will work harm to every honest driver if it is attempted to be enforced, and so far as the dishonest ones are concerned, the judges can protect the public against them, and are expected to do so, by the application of other rules than this one in reference to laying up heats. If the judges are supposed to know enough about driving a race so that they are to decide when a man shall drive for a heat and when he shall not, it would naturally follow that they would also know when any driver was pulling a horse. The best thing to do with that rule is to repeal it.

"I saw an article in an eastern paper, not long ago," continued Doble, "which gave something of the early history of the chestnut gelding called Dot, that was in my stable along back in 1869, and it told how he was brought up in the maritime provinces and badly abused before Wesley P. Balch of Boston bought him for Colonel Russell. Dot was the smallest horse I ever drove, and I guess the smallest that ever showed speed enough to beat 2:30 trotting, as he stood only thirteen and one-half hands high and weighed barely 600 pounds, so that you see he wasn't very much, even for a pony. The first I ever heard of him was when I received a telegram one day from Col. H. S. Russell, of Boston, saying that he had shipped Dot to me. I didn't know what Dot was, and was rather surprised at finding a mere pony when the express car reached Philadelphia. I soon discovered, however, that Dot was a genuine trotter. He was a chestnut in color with a white face, and I think three white feet, and a prouder or more up-headed little horse you never saw. He seemed to know that he was great goods for his inches, and acted as though he were sixteen hands high instead of thirteen and one-half. I trotted him quite a little the summer of 1869, starting in June and going the last race at Baltimore in November, when he beat George M. Patchen Jr. Dot's record while in my hands was 2:32½, but I drove him

Digitized by Google

a mile in 2:29, and one time when the owner of a little stallion called Ironsides, that was also a Philadelphia horse, was arranging to get a match against Dot, both horses to go with running-mate, I hitched Dot that way and he stepped a mile for me in 2:21. I had learned that Ironsides had gone in 2:23 rigged the same way, and therefore, when the other people came around looking for the match, I accommodated them, and beat Ironsides easily enough. Dot was subsequently burned to death in a fire that destroyed a good many horses, being at that time, in John Turner's stable."

A Logical Reply.

From the Spirit of the Times, January 30.

It is with the utmost satisfaction and confidence that the unbiased and unprejudiced breeder of the trotting horse and the admirer of trotting sport reads the long list of stockholders of the American Trotting Register Association, recently published in the Monthly. It is in itself a calm yet overwhelmingly logical reply to the false yet reiterated accusation that the association was a monopoly in the hands of a few wealthy shareholders. When the convention of trotting-horse breeders met at Chicago in May, 1891, it was for the distinct purpose of taking the registration of trotting stock out of the hands of the one man monopoly of the Wallace Register Company and of placing it in the hands of an association composed of and governed by the breeders themselves. At that convention every great breeding section was represented, and it was admitted to be absolutely and thoroughly representative of the great breeding interests. The great work of organization was completed with unanimity and enthusiasm, and the spirit and sentiment of the convention was conscientiously carried out by the Board of Directors in the organization of the association. In spite of legal delays, the American Trotting Register Association was soon in active operation, and it is now transacting the great business of registering the eligible trotting stock of the country in so prompt and reliable manner that, instead of carping criticism, it is entitled to the loyal support of all honorable horsemen. The Jesuitical statement that there is no trotting register simply because the pacer has been admitted to the standard is a specimen of verbal hair-splitting unworthy of the source from whence it emanates. The trotting register of to-day is a greater fact and a more progressive one than at any time in the past history of the breed, for it is backed, endorsed and owned by the leading breeders of the land. There should be no jealousy on the part of those who declared their inability to do that which the Register Association has successfully accomplished. The demand of the vast majority of the breeders of the country was unanimous for immediate action, and the door is open to-day for every breeder who has not yet joined the present association to do so. The Board of Directors of the American Register Association are men of national reputation. They are a body of which any association might well be proud. The office sought them, not they the office. At great sacrifice of time they have devoted their vast business abilities and their great experience "in all honesty of purpose" to the interests of breeders of the trotting horse. Every trotting horse breeder to-day can register his stock at one-half the fee paid to the Wallace Company by becoming the owner of one share, and in addition he becomes a stockholder and has a voice in its management. The policy of the association is to scatter the stock so that every breeder will be a stockholder, and breeders who have not yet done so are cordially invited to apply for stock. The association is doing a great work and doing it well. It is not the duty of this journal to inquire into the motives which have caused the attacks upon the executive which began immediately after the election, it is enough to say that to the impartial mind no reasonable motive is discernable. It is certainly unjust and unmanly to subject the officers of the association to a running fire of hostile comment before they are warm in their seats and months before they will be able to give an account of their stewardship at the first annual meeting of the shareholders. We are quite satisfied when that day does come they will enjoy then, as they do now, the support and confidence of the trotting-horse breeders of the continent.

What the Turf Journals Say.

The convention was a remarkably harmonious one. A spirit of fraternity prevailed throughout its sittings. There was no factional fight in any of the proceedings. The directors were elected with unanimity, and the Executive Committee was elected with the same unanimity. Everything has gone on since the convention adjourned with even

Digitized by Google

better results than was anticipated by the most sanguine members of the convention.

In so large a body of men it is surprising that so little fault has been found. Of course all men don't and can't see alike. There is a diversity of opinion on all subjects, but that the directors have carried out the views of a large majority of the breeders there is no doubt. The majority must rule. The minority can not rule in a country like ours.

The work of registration has gone on splendidly. Since the clerical force in the register's office at Chicago got into working order they have done more work in the same time, and as good work, as was ever done by Mr. Wallace's trained clerks, and if the volumes that are now being issued don't contain less errors than those that preceded them, we shall be greatly mistaken. The registrar is doing his work splendidly. He is a most diligent, systematic, methodical man. He is thoroughly impressed with the great responsibility resting upon him, and the directors believe he is doing his work in such a manner as will commend it to the approbation of the breeders of the entire country. Should he fail to do that, there is not a director that would not try to find a more competent man.

In the convention of breeders it was expressly stipulated and stated that the object of the convention was to establish rules for the registration of trotting and pacing horses. We think this was in the report of Major Campbell Brown, of Tennessee. This report was unanimously adopted. This convention was the highest law-making power. The directors were elected by the convention to carry out its will. If there was opposition to the registration of the pacing horse, then and there was the time to express it, and strike out the pacer, but it was not done and the directors had no other course left them but to carry out the will and decree of the body that had elected them. —*Coleman's Rural World.*

IN spite of all the lessons of the past, the Committee of the National Association of Trotting-Horse Breeders has decided to extend its official authority to a new stud-book on the plea that the admission under certain conditions of the pacer to the standard is distasteful to a large number of the breeders. The secrecy of the preliminary steps of this movement will not commend it to the American people. It was discussed and informally agreed upon at a meeting of the committee on Wednesday, January 27. On the following Wednesday, February 3, it was finally decided, and on Thursday its rules for the recognition of records and its new standards were given to the press. We believe we are right in stating that these half-dozen gentlemen did not call a meeting of the association to ratify such important action, and they certainly did not take the breeders of the country into their confidence. We willingly give the association all the credit which is due to it for the good work it has done in the past. In charity, we pass over its vacillation during the legal difficulties which for a brief period prevented the American Trotting Register Association from obtaining control of registration, but in the light of history we can only see failure in its attempt at an opposition stud-book, and we hope that a policy of conciliation and co-operation will yet prevail. The triumphs of peace are grander and more enduring than the victories of war, and there is no question in dispute before the breeders which can not be honorably and amicably settled at the next meeting of the stockholders of the American Trotting Register Association.—*Spirit of the Times.*

WORD comes from New York that the National Association of Trotting Horse Breeders have resolved to open a registry of trotters, and have chosen C. G. Gue as registrar. This announcement, in the opinion of *The Review*, bodes no good to the interests of the trotting-horse breeders. What is wanted of two registers is not easy of explanation. It can only lead to confusion, for with two registers with different standards, the words "standard and registered" will have lost their significance unless accompanied with an explanation. The founder of the registry was J. H. Wallace, who carried it on until April of last year. Mr. Wallace was the man of all men for the work in its early period, but he had many qualities which caused bitter enemies, among them the powers that be in the National Association of Trotting Horse Breeders. Growing out of the quarrel between Mr. Wallace and that association was the convention of breeders held in Chicago last April. At that convention breeders from all parts of the country were in attendance, and by those breeders the American Trotting Register Association was organized and the Wallace plant purchased. The new register was to be of the breeders, by the breeders and for the breeders, and every breeder in the land was invited to take stock in the corporation and assist in its management. The effort was honestly made to

Digitized by Google

have it representative of the breeders from the whole country, and some hundreds are now holders of stock. The board of directors chosen comprise the best representatives of the business, and they are all gentlemen of the highest character. Mistakes were undoubtedly made, as is likely in the organization of such an institution, but they are easily remedied and no doubt will be rectified. * * * Upon the breeders of the country depends the welfare of the register. However much they may see in the American Trotting Register Association to censure, they must still remember that it is their own association, and each and every breeder has his share of responsibility. Let each and every man do his duty and take an interest in the affairs of the assotion—not leave it to others—and then the registry will fully and amply represent them. Until we become more fully advised as to the intents and purposes of the new candidate for the patronage of breeders we refrain from comment on their action and their proposed methods of doing business. We reiterate, however, that we see no reason for the establishment of a new register, especially if the ne now in existence will take cognizance of is needed and will so shape its affairs as ive to the breeders of the country that it dealizes the situation, and by clean, clearsiness methods demonstrate its ability pile the complex and multifarious details come under its jurisdiction.—*Clark's se Review.*

NOT INDORSED BY TRACY AND STANFORD.

It was stated by whoever gave to the press the report of the Executive Committee concerning the establishment of a National Trotting Stud Book that "H. W. T. Mali, L. D. Packer and W. F. Redmond are behind the movement, while it is endorsed by Secretary Tracy, Senator Stanford and other prominent breeders." The reporters who made use of the announcement can inform their editors who their authority was. It is certain that the truth was not fully stated. Secretary Tracy does not indorse the proposed National Trotting Stud Book. He said to us that the scheme is Quixotic. The American Trotting Register is too strongly intrenched with the breeders of the country to be overthrown. Two registers are not desired because they would create great confusion. In a letter to us, Senator Leland Stanford says: "Until the receipt of your letter I had not given the matter consideration, but I certainly do not feel disposed to lend my support to two registers unless it is for some good reason that has not yet been explained to me." Senator Stanford is a stockholder in the American Trotting Register. The proposed trotting stud book seems to have the support of just three men, Mali, Redmond and Packer. It exists only on paper.—*Turf, Field and Farm.*

THE MALI-PACKER COMPANY.

The little Mali-Packer concern, that is making such a noise about the registration of trotters, will not seriously disturb anyone. Many members of the old association, miscalled the National Association of Trotting-Horse Breeders, will have nothing to do with the projected movement, and those who are undertaking the job are not formidable factors in the breeding business. The high-sounding title which this body has assumed was no doubt adopted in irony. They called themselves National because they were sectional, and trotting-horse breeders because they bred none. Neither Mr. Mali nor Mr. Packer was ever known as a trotting-horse breeder to any alarming extent. If either of them has ever issued a catalogue or bred a 2:30 trotter the fact has escaped our notice. The association never had a vestige of authority except what it assumed of its own volition. It represented nothing but its own membership, and did not represent that well enough to hold on to the powers which it had usurped.

The real trotting-horse breeders of the country have organized a registry of their own. They thought themselves fully as capable of conducting their own affairs as were a little band of dilletante horsemen in New York or any other state. They have bought out the Wallace company at great expense, elected competent officers who are performing their duties in a very satisfactory manner, and they are now receiving the support of the trotting horsemen of all sections of the country—*Kentucky Stock Farm.*

"A CLUMSY SUBTERFUGE."

The American Registry Association is the most thoroughly democratic and representative organization of the breeders which has ever been propagated in the United States. If there is anything in the policy it represents antagonistic to the real interests of the trotting horse, it may be set down as a fact not to be disputed that a suitable manifestation of disapproval on the part of the breeders will be

Digitized by Google

wholly adequate to procure the application of corrective measures. The Registry Association has never been asked in a formal way, by any person or faction entitled to consideration, to amend its rules in regard to the pacer. Until a demand of this sort has been made in some manner to indicate that it is the voice of a respectable proportion of the breeders, who are solely interested, any alliance that sets up an establishment of its own and makes the rule in question a pretext of its apostasy, can not easily clear its skirts of the imputation that it has plunged the government of the turf into needless and entangling complications. This is the indictment that will stand against the National Breeders' Association, if its own reasons for its course are to be accepted. But, as previously outlined, its declaration is a mere sham—a clumsy subterfuge to conceal its vaulting ambition. It was defeated (whether wisely or not, we shall not discuss) in its demand for recognition by the assembled breeders at Chicago, and it has resolved upon radical measures to restore its waning power in the control of affairs, not stopping to consider whether its headstrong course were likely to result in illimitable and unnecessary injury to the trotting turf, or whether it had received a call to till the field which it enters with such confident footsteps. It is significant and inspiring to observe that its arbitrary assumption of authority finds but one defender among all the turf papers, and that *The Horseman*, which is willing to become the "stuffed prophet" of anything that promises to encompass the humilation of the present standard, regardless of what else may be wrecked by the process. Assuming that the turf press fairly reflects the sentiment of its readers, the new domination has not much favor to expect from that source. —*The American Trotter.*

THE VERIEST PRETEXT.

THE howl about the pacer being admitted to the standard comes a little too late to be in good taste. Both Mr. Mali and Mr. Packer were members of the Chicago convention, and were doubtless present when the charter of the new Register company was adopted, which instrument provided for the registering of pacers as well as trotters. Their shrieking and wailing should have begun then. This is true, also, of some journalists who are now claiming that there is no trotting register because pacers are also admitted. Some of these gentlemen, probably all of them, voted for the charter which recognized the pacer. Why were not their clarion voices raised in protest at that time? What was the necessity of waiting to see whether or not the appointment of a registrar would be satisfactory to them before they made their objections?

The talk about the pacer is the veriest pretext. It is a sham, and only used to create prejudice; and it is a sham that these gentlemen should use very charily. It comes with especially bad grace from the gentleman who presided at the meeting that let the pacer in.

There is not the slightest disposition on the part of the breeders to again put themselves in the hands of a body of men that were too imbecile to hold power when they possessed it, and they weigh, at their precise value, the vaporings of writers about the pacer, when they know that these same writers were participants in the deliberations of the body that admitted the pacer to the standard. The American Trotting Register Association will still continue to do the business, without being greatly disturbed by these malcontents or the little local concern that is foolish enough to attempt to become its rival.—*Kentucky Stock Farm.*

ANARCHY, directed by intelligence, is is all a bad sort of curative agent for so[illegible], though it may be more or less energeting- results. It is bitter to the opposing pow[illegible]is- may result disastrously to the bomb-th[illegible]ly but the effect, generally speaking, may be [illegible]ficial. So, also, with the turbulent, even ma[illegible]nant assault upon the present administration of trotting-horse breeders. By this somewhat caustic criticism, it may be benefited in the long run, and certainly there need be no fear that it can be injured. The whole matter rests with the breeders, and while they, as a body, may make errors, they will eventually "square themselves again," and settle the standard in all its departments, in a manner at once commendable to their judgment and in consonance with the rise and progress of the trotting horse of America. Co-operation must be the basis of success. Any man, or set of men, who will deliberately pull out of the parent association, asseverating that there is not now a register, is no friend of the trotting horse. In New York, certain pessimists have exulted in the hope and belief that the American Trotting register would fail to meet the views of the turbulent element of the horse world, and have actually established, or at least printed rules, etc., of what they have christened a National Stud

Book. We do not care to discuss their improved standard, for the reason that when the Chicago plant fails to satisfy our requirements, we can change cars at Albany and go to Boston, or—what's the matter with Dunton?

Let the New York affair die in embryo, for there is room for but one trotting horse register, and the breeders of the nation will not intrust the custody of their honor—and all pedigrees are based upon honor—to the man or set of men who are so antagonistic to unison and harmony as they must be, who will endeavor to inflict upon the people such confusion and uncertainty as other patronized registers would surely do. In this connection, we are reminded of Pope's sapient remark:

"Tis with our judgments, as our watches; none
Go just alike: yet each believes his own."

* * * * * * * * .

We have the utmost faith in the American Trotting Horse Breeders' Association and the officers thereof, in perfecting the rules, laws and regulations in such a manner that they will reflect the industry in its highest form. Never before in the history of the light-harness horse has there been so much interest manifested as at the present time, and it is but perfectly natural that there should rise up a number of people to oppose and people to endorse: there are bound to be elements on both sides that surge strong and hard, some from purely philanthropic motives and some from selfishness. However, water will seek its level, and we look for the American Trotting Horse Register Association to rise strong and rapidly, and to be the gleaming headlight, guiding the breeder on his course to perfected results.—*Western Resources.*

Notes and News.

THE stallion, Mark Field, a son of George Wilkes, dam Corinne, by McDonald's Mambrino Chief, died the other day at Aurora, Ill., of spasmodic colic. He was foaled in 1874, and his fastest representative was the bay gelding, Veritas, 2:18¼.

JAMES K. NEWBRO, who has for a number of years been well known as a trainer and driver of trotters, died on February 10, of pneumonia, at the Fashion Stud Farm, Trenton, N. J., with which he was connected. Mr. Newbro's death was entirely unexpected by horsemen, as it was not generally known that he had been attacked by sickness, and the regret concerning his taking off will be general.

THE stallion Electrite, a brother of Sphinx 2:20½ and Egotist 2:22½, all three of these horses being by Electioneer and out of a daughter of the famous Pilot Jr. mare Waterwitch, has been sold by the Allen farm to Mr. Henry Exall, of Dallas, Tex. Electrite was purchased when a yearling at Palo Alto for $5,000. His new owner is a banker and has spent a good deal of time lately looking at various stallions in the North, his first idea having been to secure a son of George Wilkes.

THE London *Field* in an article on "The Horseshoe Problem as Related to the Stone Pavements of English Cities" refers at some length to a recent article in the MONTHLY by "S. T. H." saying: "In this connection there is an excellent paper entitled "Problems in Farriery" in the January number of WALLACE'S MONTHLY. The American expert in horses is nothing if not practical—all experts ought to be—and in the article alluded to are some very sensible remarks which might well be pondered over by English horse owners."

A CORRESPONDENT in Royal Oak, Mich., writes: "I notice much talk regarding the licensing of drivers, some going so far as to suggest that horses also be licensed. It may or may not be best to license drivers, but we have prospered quite a while without it and we might prosper longer with it. One thing is certain, the small breeder who wishes to attend a county fair and take his trotter out for a day's sport, with the prospect of capturing an honest dollar, or, perhaps, making a sale, will not submit kindly to the ordeal of securing a license. As to licensing horses let me illustrate: B has a license for his bay gelding, Hopscotch, fully described. C has a faster horse of the same description, and they trade. Off goes Mr. Ringer with the certificate. He is loaded for a bear, has a license, and how will you stop him with this extra fortification?

IN the present issue of the MONTHLY appears an article regarding Sunol, the fastest trotter in the world, by the records, which article is contributed by Mr. Robert Bonner, whose name has always been a tower of strength to the trotting-horse interests, and who has certainly done far more than any other man to place the ownership, breeding and racing of the light-harness horse on its present high plane. The MONTHLY naturally takes pride, as well as pleasure, in presenting to its readers something from the pen of Mr. Bonner, as heretofore that gentleman has de-

Digitized by Google

clined to write over his own signature for publication, although requested to do so by the most prominent periodicals in this country. What he has to say regarding the future of Sunol as a contestant against her own champion record is valuable news, as are also the other facts he gives regarding the great mare.

THE Wallace Year Book for 1891, Volume VII, is now ready for delivery. Price postpaid, $2.50. It is believed to be the most complete and valuable history of trotting and pacing performers ever issued. The Great Tables contain all the 2:30 trotting and 2:25 pacing performers to date of January 1, 1892, with all that is known of their history and breeding. All authenticated trotting and pacing performers of 1891 are published, without regard to time made, and a complete index of places of trotting and pacing, and of performers' names and records attached. The volume contains about 1,000 closely printed pages, and is indespensable to the breeder, owner and trainer of light-harness horses. Orders will be filled as received, and as the first edition is comparatively limited, those wishing to receive volume VII without delay, should order at once.

Volume X, Wallace's American Trotting Register, is now in press, and will be issued about March 15. Price per volume, $5. Order early to avoid delay.

THE late Sir Edward Bulwer (Lord Lytton) gave a very pleasing account of an Andalusian pony, which he purchased merely to satisfy a whim. He was in London, at Broadstairs, when his eye was caught by the singular beauty of an Andalusian pony, exposed for sale in a mart across the street. The pony was so perfect in every particular and such an elegant specimen of the breed that his curiosity was aroused to know what such an animal would bring under the hammer. He inquired the price, and finding it very low, immediately purchased it. Bulwer was then at the age of twenty-one. Of the pony he says in his pleasant way: "Few friendship have I formed among my fellow-men so intimate as with this black-maned Andalusian. It lasted me more than twenty years, and died then, not of old age but of an inflammatory disorder, preserving its beauty and spirit to the last. It was small, but of the Arab form and constitution, which can go extraordinary distances without evincing fatigue. I have ridden it seventy miles a day, and the next morning it was equally fresh and full of fire. I never found another horse which I had the same pleasure in riding, and indeed, I have cared little to ride at all since its loss."—*Exchange.*

THE way blind horses go about is remarkable. They rarely, if ever, hit their heads against a fence or stone wall. They will slide off when they come near one. What is it that warns them? It can not be shade or shelter that warns them. On an absolutely sunless and windless day their behavior will be the same. Did you ever watch a blind horse looking for water in a pasture or along the road? He will walk along with his head straight before him until he comes near the water, and then suddenly drop his head down. Their sense of smell seems so sensitive when deprived of sight that they can detect water at a distance of a hundred yards. There was at one time in a family of the writer a blind horse. He would walk into the open door of the stable and never miss it. Passing down the row of stalls, he would enter his own, and never make a mistake. He was turned into a field bordered by a railroad, and a watch put upon him to see that he did not get upon the road. In the course of the watching it was found that he would not go upon the track. He would walk straight toward it, and when a few yards distant, would suddenly veer away from it. When this fact was ascertained, he was left alone day and night in the pasture, and no harm ever came to him. Some one says that none of the five senses has anything to do with singular perceptive power, but that the impressions are on the skin of the face, and by it transmitted to the brain, and this unrecognized sense is called facial perception.—*Exchange.*

NOT long ago Messrs. Miller & Sibley, of the Prospect Hill farm at Franklin, Pa., of which establishment Charles Marvin is now the head trainer, found that in order to carry out some plans they had formed in regard to that enterprise it was desirable to secure more representatives of the Electioneer blood, and they communicated with Senator Stanford in regard to the purchase of Cecillian, that in 1891 made a two-year-old record of 2:22; Election Bell, by Electioneer and out of Beautiful Bells; and Belleflower, two-year-old record 2:24¾ in 1891, a sister to Election Bell. The dam of Cecillian is by General Benton, second dam Cuba, a thoroughbred daughter of Australian that is also the dam of Cubic, 2:28½. When the

Digitized by Google

sale of these three animals was first suggested to Senator Stanford, that gentleman said that they were not for sale at any figure, but after Messrs. Miller & Sibley had explained their reasons for wishing to own the animals he consented to let them have the horses, and that they should fix the price for the three. It is doubtful if in the annals of business transactions in horseflesh a similar proposition was ever made to would-be buyers, and the action of Senator Stanford was the greatest compliment to the absolute fair-mindedness of the Pennsylvania gentlemen that could be paid. They considered the matter and then voluntarily paid $50,000 for the three colts, figuring Election Bell (whose name they have changed to Belsire) at $25,000; Cecillian at $15,000; and Belleflower at $10,000. The two last named are certainly great three-year-old trotters, as evidenced by their performances last season, and they are to be entered freely in all free-to-all stake races for trotters of their age. Cecillian will be bred to about thirty of Miller & Sibley's choicest mares.

THERE has been a good deal written of late in regard to uniformity of color in the progeny of certain stallions, and notable instances of this character have been given. An interesting case in point is that of the stallion Tempest, a son of Almont and out of an Edwin Forrest mare, his second dam being the famous Pilot Jr. matron Waterwitch. Tempest is owned by W. H. Raymond of Belmont Park, Mont., and out of 200 living foals he has sired 195 bays or browns, not a single black, chestnut or roan, the remaining five being grays, out of gray mares. Tempest is in color a duplicate of his sire Almont, being a solid dark mahogany bay. Siren, his dam, was a rich bay, and so was Waterwich. Edwin Forrest was a bay, his sire, Young Bay Kentucky Hunter, was a bay, as was also Alexander's Abdallah and Rysdyk's Hambletonian. Tracing as he does to bay ancestors through four or five generations on each side, Tempest has a license to transmit the bay color and is a good illustration of the fact that color can be reproduced with a reasonable degree of certainty which in this case amounts to almost absolutism. There is no question that at this time a great deal of attention in the breeding of the light-harness horse is being paid to producing a high type of animals in regard to color, size, substance, symmetry, style, beauty and docility. In the way of speed practically everything has been accomplished that can reasonably be expected, and of course in the effort to obtain that much-desired quality other essentials have in many cases been neglected, but from this time on it is inevitable that beauty will be sought for as well as the ability to trot fast, thereby enhancing the valuable qualities of an animal that is already the pride and wonder of the world.

PEOPLE, who at the beginning of the auction-sale season that is now coming to a close, were confident that the trotting-horse market would not stand the pressure to be placed on it by the unusually large offerings of well-bred stock, have by this time, no doubt, reached the conclusion that while the cheaper grades of horses are not bringing as fancy prices as they did a year or two ago, there was never a time when the really high-class ones were selling for as much money or being as eagerly sought for as at the present time. This was amply demonstrated when Mr. Forbes went to California and paid $125,000 for Arion, and while it might possibly be said that this transaction was one in which the value of the animal that changed hands was fixed arbitrarily by one rich man and concurred in by another, Mr. Forbes made two other purchases, which showed that even when a really sensational performer was not the goods disposed of, prices ruled high for first-class material. Mr. Forbes paid $25,000, for instance, for the four-year-old Electioneer filly Mont Rose, 2:18, as a three-year-old, and Starlight, that beat 2:30, as a two-year-old last season. It is true that these animals were exceptionally were well bred in the female line as well as the male, one being out of a mare with a four-year-old record—Beautiful Bells. These were long prices to pay in California for animals that must be shipped east before they could begin earning back the money paid for them, and yet it was not more than they would have brought in the open market, if offered for sale in that manner. The public sales of trotting stock this season have demonstrated that the market was never in better shape, but there has been a marked change in the ideas and methods of buyers. Not long ago there were plenty of men investing in horseflesh every season who would pay long prices for pedigrees alone, but at the present time it is found that in order to command top figures horses must not only be trotting-bred, but must also be trotters, or the progenitors of trotters. Of course particularly distinguished relationship

Digitized by Google

is worth a good deal in the auction mart for horses, as evidenced by the fact that a brother to Arion, 2:10¾, brought $25,000; a brother to Sunol, 2:08¼, $14,500; a brother to Allerton, 2:09¼, $15,000, and a yearling brother to Axtell, 2:12, $7,500. A performer was never so high priced as at the present time. For instance, one breeder, a Pennsylvanian, paid, at a recent sale, $41,550 for three brood-mares and one yearling colt, but the mares were Mary Marshall, 2:12¾; Palo Alto Belle, 2:22½; Lizzie Mac, 2:25¼, while the yearling colt was by Alcantara, 2:23, and out of Palo Alto Belle. In addition to having fast records, these mares are among the highest bred ones in the world, and still young in years. The sales of the present winter have demonstrated the fact that real merit—which means speed or producing qualities—is in demand.

THE latest act in the Nelson-Noble drama, so far as the National Trotting Association is concerned, took place at the meeting of the Board of Review in New York City, February 10, when Noble and the stallion Alcryon were expelled, similar action regarding C. H. Nelson and his namesake, the stallion with the record of 2:10, having been taken a long time ago. George Robens, who drove Alcryon in the famous stallion race at Boston, over which all the trouble regarding Nelson and Alcryon arose, was present at the board meeting in New York city and made a statement in his own behalf, saying that, so far as he was concerned, the Boston race was trotted on its merits, as his instructions from Noble were to win with Alcryon if he could. It is understood that Robens' manner impressed the board favorably, and his case was continued until the May meeting, when the chances are that he will be reinstated. Robens, whose name has, during the last few trotting seasons, been mixed up, either justly or otherwise, with a good many rather shady turf transactions, was, a dozen years or so ago, about as innocent and truthful a young man as ever held the lines behind a trotter. In the summer of 1879 Robens came to Chicago with the bay gelding Russ Ellis and started him in a race for trotters of the 2:27 class, the balance of the field consisting of Deck Wright, Rose of Washington, Lida Bassett, Alley, Monroe Chief and G. T. Pilot, every one of which horses subsequently made fast records. It was an exciting race all the way through. Monroe Chief, being owned in Chicago, was a local favorite, but Frank Van Ness, who drove him that day, was a little shaky in his nerves, owing to having, in another race, met with an accident on the back stretch while driving Scott's Chief, that horse choking down and falling through the fence with Van Ness. This left a hole, and in the Monroe Chief race when Van Ness reached that point in the mile again he lost his head completely and drove the Chief against the fence, the sulky being capsized and the driver pitched out. This was in the fourth heat of the race, Alley having won the first in 2:19 and the second in 2:20¼, while Rose of Washington had taken the third in 2:21¾. When Monroe Chief ran into the fence and dumped Van Ness overboard he was behind the other horses and, of course, started to run away. As the drivers came down the home stretch there was a good deal of excitement and shouting by the crowd to the drivers to look out for Monroe Chief, who wanted to knock the whole outfit against the fence. In the scuffle to get out of his way which ensued Deck Wright managed to win the heat in 2:23¼, Monroe Chief being distanced. In the fifth and deciding heat Russ Ellis, who started in the race a little lame and had been getting worse all the time, found himself so far behind the others when the half-mile pole was reached that it was only by virtue of a long run that he landed inside the flag. If he stayed in the race he was certain of fourth money, and it was apparent that the judges really didn't know whether or not the horse was out. The distance judge was also in the dark. Finally Robens was called over to the stand and asked by one of the judges how far his horse ran. Under the circumstances it would have been the most natural thing in the world for Robens to have given a non-committal answer, but instead of doing this he replied with evident truthfulness, "About a quarter of a mile," which statement, of course, left the judges no alternative but to distance Russ Ellis, thereby knocking him out of fourth money.

Questions and Replies.

L. H. McG., MORTON, MINN.—1. Please give description, age, pedigree and breeder of all registered geldings named Chester. 2. Give best record in 1891 of bay gelding J. W. B., by Chrosroes, and where, when and in what class made. 3. Is there any penalty against him on American or National Association tracks?

ANSWER.—1. There are two only, viz.: b g foaled 1886; by Hambletonian, 10; dam by Seely's American Star; bred by Gabriel

Digitized by Google

Wood, Middletown, N. Y., and ch g foaled 1867; by Patrick Henry; dam Molly, not traced; bred by William T. Sawyer, Hartford County, Md. 2. Best record, 2:42, at Corydon, Iowa, as per the following summary:

Corydon, Iowa, Sept. 23. 1891—Purse $50. 3:00 class.

J. W. B., b g, by Chosroes.....	1	1	1
Chancy T., b h, by Little Crow....	2	3	2
Rowdy Boy, ch h, by Dick McNair	3	2	4
Benny C., —, by Ensign.....	4	4	3
Winnie B., br m., by George Milo.	5	5	5
Lady Bestow, br m, by Walter Lewis.....	6	6	dr

Time, 2:42—2:44¾—2:46.

3. No penalty or claim against the horse on books of the American Trotting Association. Cannot inform you in regard to the National Trotting Association. Address, M. M. Morse, Secretary, Hartford, Conn.

H. McK., Kinsman, Ohio.—1. Is there a registered son of George Wilkes named Forward: if so, give number and pedigree in full. 2. Is there a new 2:30 performer named Oklahoma, by Judge K. Wilkes?

Answer.- 1. Yes, No. 1961, bl h foaled 1875: byGeorge Wilkes 519; dam Lou Coons, by American Clay 34; 2d dam Nokomis, by Mambrino Chief 11; 3d dam Mrs. Caudle (dam of Ericsson), pedigree not traced. 2. No. The only 2:30 performer with any name approaching Oklahoma, is Okalona, black mare, by Warwick Boy. Record 2:27¾, at Rome, N. Y., July 31, 1891.

C. A. R., Santa Ana, Cal.—Give registered number of—1. Hambletonian Star (Andrew's Abdallah), by Abdallah, 15. 2. Mariner, by Smuggler. 3. Norwood, by Norman 25. 4. Glenwood, by Blackwood. 5. Black Captain, 2:29¾, by Mazeppa. 6. Was this Mazeppa the sire of Happy, 2:27?

Answer.—1. No. 2732. 2. No. 1718. 3. Not standard, hence no number. 4. Not standard. 5. Not registered as standard. 6. The breeding of Happy is not positively established. She is by a horse called Mazeppa, but not known to be Mazeppa, 15261, sire of Black Captain.

A. M. R., Newago, Mich.—1. Is Kitty Odell, by Phil Sheridan 630, registered. If so, give volume, full pedigree and name of breeder. 2. Give number, age and full pedigree of Ben Odell, by Louis Napoleon.

Answer.—1. Yes. Volume VII, page 418, American Trotting Register, chestnut mare foaled 1876; by Phil Sheridan 630; dam Toronto Maid, by St. Lawrence 657. Bred by Remi Joinesse, Sandwich, Ont., Can. 2. No. 5279, bay horse foaled 1873; by Louis Napoleon; dam Kitty Odell, by Phil Sheridan, etc.

J. A. B., Emporia, Kas.—Can you give me any information concerning Cash Boy, by Dick Turpin? Has he a record of 2:30 or better? If so, when and where made.

Answer.—Cash Boy, bay gelding, by Dick Turpin, is credited with a record of 2:36¼, but we fail to find an account of any heat made by him faster than 2:38¼, at Vinita, I. T., September 24, 1885. He certainly has no record of 2:30 or better.

J. F. H., Donnellson, Ill.—I enclose printed card, giving pedigree and description of "The Thoroughbred Abdallah Stallion, Roy Clark." 1. Please give his registered number, volume and page. 2. Also number of Tom Crittenden, said to be a full brother of Roy Clark, and registered on same page.

Answer.—The card containing alleged pedigree of Roy Clark is certainly false and fraudulent in many particulars, possibly in all. It states, "The Thoroughbred Abdallah Stallion, Roy Clark, bay horse, foaled June 10, 1884, registered in Vol. IV, American Trotting Register; by Abdallah Jr., son of Abdallah, 15; dam Humming Bird, by Ben Lomond 2870, etc.," and "For further pedigree, see Wallace's Trotting Register, Vol. IV, page 379." Roy Clark is not registered, either as standard or non-standard, in the American Trotting Register, nor is he eligible to registration. He is not a "thoroughbred Abdallah stallion," and his further pedigree can not be found on page 379, Vol. IV, Wallace's Trotting Register. Henry Fath, of Fillmore, Ill., who advertised him (as manager) in 1891, has either been greatly deceived, or is knowingly issuing a fraudulent pedigree. 2. Tom Crittenden is registered as non-standard, Vol. IV, page 379, bay horse foaled 1881; by Woodside's Abdallah Chief, son of Abdallah Jr., by Abdallah 15; dam Humming Bird, by Ben Lomond, etc. Being non-standard, he has no number, and is not, according to pedigree given of Roy Clark, a full brother of that horse.

C. W. A., La Plata, Mo.—1. Give breeding of Lizzie Witherspoon, on dam's side. 2. Breeding of Gough's Wagner. 3. Breeding of Joe Hooker's dam. 4. Breeding of Lady Wood's dam, of Virgil and Wild Oats. 5. Breeding of Nellie M., on dam's side.

Digitized by Google

ANSWER.—1. By Gough's Wagner, further pedigree untraced. 2. By Wagner, dam's pedigree not recorded in thoroughbred Stud Book. 3. Can not give pedigree of Joe Hooker, by Andrew Jackson, on dam's side. 4. The dam of Virgil and Wild Oats is Lady, by Young Columbus, further pedigree untraced. 5. The breeding of Nellie M., on dam's side, is untraced.

Catalogues for 1892.

LARCHWOOD BREEDING STUD.

ONE of the handsomest and best arranged catalogues issued this season is that of W. A. Sanborn, Sterling, Ill. The catalogue contains the tabulated pedigrees of 150 standard-bred animals, including the royally-bred stallions Capoul 1037, record 2:28, by Sentinel, dam Rosa Clay, by American Clay; Combat 1038, by Hero of Thorndale, dam Abutillon, by Belmont; Williams 4013, record 2:20½, by Combat, dam Gauntlette, by Dictator; and Benefactor 4009, record 2:28, by Egbert, dam Mary, by Woodford Mambrino; a quartette of great horses, as sires and individuals. The younger stallions are Gotha 11121, by Mambrino Wilkes, dam Lindora Wilkes, by Guy Wilkes; Anthedon 10898, by Antevolo, dam Ruby, by Winthrop; and Job (a full brother to Brown, 2:18¼, and Williams, 2:20½), by Combat. The pedigrees of the brood-mares, nearly fifty, are full of illustrious names and rich breeding, and the young stock offered for sale is worthy the attention of the most fastidious buyer of trotting horses, either for track, road or stock farm. Among the many fast 2:30-performers bred at Larchwood are Williams, 2:20½; Brown, 2:18¾; Soudan, 2:20, and Ovid, 2:24½. Sterling is 110 miles west of Chicago, on the Chicago & Northwestern and Chicago, Burlington & Quincy railways. Visitors are cordially invited to inspect the stock.

LYLE STOCK FARM.

C. E. Lyle, of Dowagiac, Mich., issues a neat little catalogue for 1892, the first pages being devoted to the premier stallion of the establishment, McGregor Wilkes 11444, three-year-old record 2:22¼, four-year-old record 2:21. As his name implies, this stallion combines the McGregor and Wilkes strains, being sired by Robert McGregor, 2:17½, dam Alice Wilkes, by Red Wilkes; second dam Alice K., by Almont. Individually, he is as good as his breeding, and his speed is attested by his record of 2:21 in 1891, after a season in the stud until August 1. McGregor Wilkes was also winner of first prize as trotting-bred stallion at the Chicago horse shows of 1889 and 1890. The other stallions at Lyle Stock Farm are Broomal 10516, by Stranger 3030, dam Brooch, by Jay Gould 197, and Metropolis 2782, by New York 524, dam Frosty May, by Joe Downing 710. Both these horses are exceptionally good individuals. The brood-mare list, though small, is very good, a first-class foundation for a breeding establishment.

SEACORD'S STOCK FARM.

The Seventh Annual Catalogue issued by Fred Seacord, Galesburg, Ill., is a neat pamphlet of some forty pages, giving the pedigree and history of the many highly-bred animals owned at the farm, with several pages devoted to information useful and interesting to owners and breeders of trotting horses, such as "Scale of Points for Judging Horses," "Rules of the Standard," etc. The premier stallion at the Seacord Farm is Muscovite 5221; record 2:19¼, sire the great Nutwood, dam the grand brood-mare Reina Victoria, by Hambletonian 10; second dam Hyacinth, by Volunteer, third dam Clara, dam of Dexter and Dictator, by Seely's American Star. Muscovite, a horse of royal breeding, tried speed, and nearly perfect trotting formation, promises a grand career in the stud. Associated with him is the stallion Prince Edward 8002, record 2:20, by King Rene, dam Smyrna, by Japhet; second dam Snowbird, by Steel's Snowstorm. Like Muscovite, he has breeding, speed and great individual excellence. Haverill 3059, by Princeps, dam Fautress, by Hamlet, is another fashionably-bred sire owned by Mr. Seacord. The brood-mare list in the catalogue includes some twenty highly-bred mares, and is supplemented by a number of young things offered for sale at very low prices, considering their breeding and individual excellence. Seacord Stock Stock Farm is only three hours' ride from Chicago on the C. B. & Q., or A. T. & S. F. railways, and adjoins the city of Galesburg. Visitors are cordially invited and welcomed on any week day.

THE DUBOIS FARM.

The breeding establishment of Du Bois Bros., is situated at the foot of the Rocky Mountains, near Denver, Colo., and their first catalogue, recently issued, is a credit alike to the horse-breeding interests of the great West in general, and those of the silver Centennial State in particular. "None but standard and

Digitized by Google

registered animals embraced in this catalogue" is a notable announcement to be able to make of a pamphlet of nearly one hundred pages, issued in a state, whose standard-bred trotting horses could, ten or a dozen years since, have been counted on the fingers of one hand. But the roll of the DuBois stallions and brood-mares includes the choicest strains of blood in the Trotting Register. The head of the stud is the great stallion Superior 4012, record 2:17¼, by Egbert, dam Mary, by Woodford Mambrino, second dam Belle, by Alexander's Norman, third dam Vic, by Mambrino Chief. Superior was a great race horse, and promises equal success as a sire, the eldest of his get to be trained, Elsie S., securing a record last summer as a three-year-old of 2:29¼. Red Reuben 11961, by Jay Bird, dam Roan Pony, dam of Blanche Clemons, 2:27½, by Reuben, is the second stallion in the list, followed by Redicta 12818, by Red Chief 4603, dam Ina, by Dictator, and Brownspur 12857, by Brown 4011, dam Nora by Hotspur. Magnet 1329, one of the favorite stallions on the farm died in 1891, but his history and pedigree are preserved in the catalogue, and several of the most valued brood-mares were sired by him. He was by Magnolia 68, son of Seely's American Star, dam Mischief, by Alexander's Abdallah. The forty-five brood-mares on the farm embrace some of the choicest strains of trotting blood, being by such well-known sires as Mambrino Patchen, Dictator, Egbert, Mambrino Chief Jr., Peck's Idol, Red Wilkes, Jay Bird, Nutwood, Abbottsford, King Rene, Stranger, Slander, Guy Wilkes, Masterlode, Magnet and Superior. Most of the mares are in foal to Superior, and the foals of 1890 and 1891 are either by that horse or Magnet.

There is no breeding establishment in the West with a better foundation for success than that of Du Bois Bros., and a trip to the farm, six miles from Denver, is one of the regulation excursions of the horse-loving visitors to Colorado.

AURORA STOCK FARM.

The catalogue of Aurora Stock Farm, A. B. Harris, proprietor, is confined to the stallions offered for public service. They are five in number, all standard and registered, three of them with fast race records. The premier stallion, Bismont 8546, record 2:18½, is by Victor Von Bismark 326, dam Ducky Almont (dam of Memento Wilkes, 2:29), by Almont 33. Bismont is described as a grand individual as well as a game and successful race horse; coming from producing ancestors on both sides, his owner is fully justified in expecting him to prove a successful and prepotent sire. King Chester 15634, record 2:19¼, at four years, is a young horse who promises to reduce his record during 1892, as during the past season he lowered his three-year-old record of 2:26¼ seven seconds, showing his ability to train on. His sire is Prairie King 2743, record 2:23½, dam Lady Prince, by Hambletonian Prince, 9716. He will make an early stud season and then be put in training. Climatize 8544, has a race record of 2:24¾, he is by Climate 8543, dam Carrie Patchen (dam of Crawford, pacer, 2:15¼), by Mambrino Patchen 58, second dam by John Dillard, a desirable and fashionable pedigree. The other stallions are Ed Hedges, 9859, by Climate 8543, dam Neilson, by Jim Monroe, and Pitt Kellogg 12855, by Chester Chief, 2172, dam Alice (dam of Oxford, 2:29½) by Toronto Chief Jr. Aurora Stock Farm is a valuable acquisition to the breeding interests of northern Illinois, and the highly bred horses there located should receive a large patronage. Aurora is about forty miles from Chicago, on the Chicago Burlington & Quincy, and Chicago & Northwestern railroads.

ASHLAND.

The seventeenth annual catalogue of historic Ashland, the great breeding establishment of H. C. McDowell & Son, Lexington, Ky., comes to hand replete, not only with a long list of royally bred trotting stallions, brood-mares, colts and fillies, but with tables and statistics that are valuable to all students of trotting pedigree and performance.

The premier stallion of the farm, the great Dictator, whose fee has been $500, is now retired, his entire service being needed at Ashland. The two horses advertised for public service are King Rene 1278, by Belmont, dam Blandina, by Mambrino Chief, and Noblesse 14486, by Dictator, dam Fuga, by George Wilkes, second dam Betsey Trotwood (dam of Phallas), by Clark Chief. King Rene is sire of seventeen 2:30 performers and of four sons, sires of 2:30 performers. King Rene is one of the greatest show horses in the country, having taken eighteen first premiums without a single defeat. The younger stallion, Noblesse, was foaled 1887 and has been selected by the proprietors of Ashland, as worthy by breeding and individual excellence to take the place of his celebrated sire Dictator, now old and retired from public service. The nineteen

Digitized by Google

brood-mares, whose pedigrees and produce are set forth at length in the catalogue, are matrons of the first rank, sired by such well-known stallions as George Wilkes, Mambrino Patchen, Cuyler, Belmont, Volunteer. Pretender, Harold, Princeps, Louis Napoleon, Woodford Mambrino, Thorndale, Alcyone, Dictator and King Rene, out of high bred and producing dams. A score or more colts and fillies, out of these mares by Dictator, King Rene and Noblesse, are offered for sale, and a full description and extended pedigree of each given. The catalogue itself is a model of typographical beauty, conveniently arranged and illustrated with a handsome engraving of the park at Ashland and portraits of Dictator and King Rene.

WOODBURN,

2:08¾, is emblazoned in gold on the front page of the catalogue of trotting stock at Woodburn Farm; the long-time champion record of Maud S., and still the fastest mile ever trotted in harness over a regulation track. Woodburn catalogue contains the names, pedigrees and performances, of 139 animals and calls attention to the following pithy facts:

"The dams of Maud S., 2:08¾, Palo Alto, 2:08¾ and Jay-Eye-See, 2:10, were bred at Woodburn.

Woodburn has bred seventy-eight animals with records from 2:30 to 2:08¾, eleven new ones in 1891.

Fifty-five Woodburn bred mares have produced ninety horses with records of 2:30 or better, including Maud S., 2:08¾; Jay-Eye-See, 2:10 and Palo Alto, 2:08¾.

Seventy-five Woodburn bred stallions are the sires of 479 horses with records of 2:30 or better, including sixty-six in 2:20 list.

This does not include the sires of sixty-seven horses with records of 2:30 or better, or the dams of thirty-eight horses, with records of 2:30 or better, that Woodburn has owned and did not breed, but whose reputations are closely identified with the farm.

Ten new Woodburn bred stallions have entered the list of 2:30 sires in 1891.

Woodburn bred stallions are the sires of 116 new comers in the 2:30 list of 1891.

Thirteen Woodburn bred mares are dams of seventeen new 2:30 performers in 1891."

This is a record unequaled by any trotting establishment in the world and a fitting introduction to the list of stallions for service and produce for sale.

The trotting stallions offered for public service in 1892 are Harold 413, by Hambletonian 10, dam Enchantress, by Lakeland Abdallah; Lord Russell 4677, by Harold, dam Miss Russell, by Pilot Jr.; King Wilkes 1867, by George Wilkes, dam Missie, by Brignoli; Velocidad 14901, by Electioneer, dam Nutula, by Belmont; Expedition 14900, by Electioneer, dam Lady Russell, by Harold; Yataghan 10879, by Lord Russell, dam Yolande, by Belmont; and Sineus 16091, by Lord Russell, dam Primrose, by Alexander's Abdallah—seven horses unsurpassed for fashionable breeding and stud performance.

The band of brood-mares at Woodburn is unequaled. It includes thirteen of that most exclusive coterie of trotting matrons "The Great Broodmare List," and the dams of forty 2:30 performers, including Maud S., 2:08¾; Nutwood, 2:18¾; Pancoast, 2:21¾; Kremlin, 2:21¼; also the dams of the producing stallions, Princeps, Woodford Abdallah, Erelong and others. Eighty-five colts and fillies, the produce of the mares referred to, are offerred for sale, visitors being invited to examine the stock on all week days. Letters and requests for catalogues should be addressed to L. Brodhead, agent, Spring Station, Woodford county, Ky.

GRETNA FARM.

Gretna Farm, the breeding establishment of F. S. Gorton, is twenty-four miles from Chicago, at Gretna, Ill., readily accessible by more than 100 trains daily, also connected by telephone with Chicago. The pedigrees of four highly-bred trotting stallions are fully set forth in its pages, the first, Pleasanton, being advertised to make the season of 1892, at Valley Farm, Grand Rapids, Mich. Pleasanton, 13662, is a full brother of Margaret S., 2:12½, sired by Director 1989, 2:17, dam May Day, by C. M. Clay 54, second dam Kate, by Hiram Drew. May Day has a record of 2:30, is also dam of Incas, 2:14½, and has the proud distinction of being the only mare which is the dam of two trotters with records better than 2:15. The next stallion, the premier for 1892 at Gretna Farm, is indeed royally bred, and from both ancestors in the most prepotent of early speed-producing lines. Saccharine 13663, is by Director, the sire of Direct, 2:06, Margaret S. (4 years), 2:12½, Guide, 2:16¼ and Evangeline, 2:19. Director was an early trotter, securing a 2:30 record at three years old. The dam of Saccharine, Sweetness, by Volunteer, has a record of 2:21¾, and is the dam of the

Digitized by Google

great Sidney, pacing record 2:19¾, and sire of the phenomenal youngsters, Frou Frou, 2:25¼, the champion yearling trotting record; Fausta, 2:22¾, the champion yearling pacing record; Fleet, 2:24, and Sid Fleet, 2:26½, at two years, Faustino (3 years), 2:14¾; Goldleaf, pacer, 2:11¼, and Adonis, pacer, 2:11½. The second dam of Saccharine is Lady Merritt, by Edward Everett; third dam by Harry Clay, 45. No young horse (Saccharine was foaled in 1888) has a better right to success as a sire of early speed. Syndic 5828, by Stranger, dam Sybil, by Jay Gould; second dam Lucy, 2:18¼, by Geo. M. Patchen, comes from race-horse families on both sides, having among his direct ancestors the famous mares Goldsmith Maid, 2:14, Lucy, 2:18¼, Lady Thorne 2:18¼ and the stallions Jay Gould, 2:20½, and Geo. M. Patchen, 2:23½. Plenty of developed speed in the blood lines of this horse. Melburn 7165, by Monon; dam Maggie F., by Menelaus; second dam Molly King, by Lexington; third dam Brunette, by Mambrino Chief; fourth dam by Gifford Morgan, combines in his pedigree the fashionable Nutwood strain, with that of Hambletonian, Mambrino Chief, Morgan and thoroughbred. The broodmares at Gretna are worthy consorts of the horses mentioned, most of the popular and successful sires of the day being represented in their pedigrees, and the colts and fillies offered for sale are as good individually as in breeding. For a comparatively new establishment Gretna Farm is on very broad and firm foundations from the standpoint of fashionable trotting pedigrees.

FORREST CITY FARM.

One of the most complete and extensive catalogues of trotting stock published this year is that of C. F. Emery, Forrest City Farm, Cleveland, Ohio. It contains name, description and breeding of nearly 200 animals, including seven stallions and forty-four brood mares, all of popular and fashionable trotting strains. With one exception the stallions are tried turf performers with low records, and among the broodmares are nine with records of from 2:12¾ to 2:29¼; sixteen that have produced one or more with fast records, and twenty-seven that are out of producing dams. These statements give an idea of the care that has been exercised in selecting the standard animals of the Forrest City Farm, and of its extent and importance as a breeding establishment. The leading stallion is Patron, 2529; record 2:14¼, by Pancoast; dam Beatrice, by Cuyler; second dam Mary Mambrino, by Mambrino Patchen. This is choice performing and producing blood on both sides. Pancoast, record 2:21¾, is sire of thirteen 2:30 performers. Beatrice is dam of Patron, Prodical, 2:17¼, and Pactolus, 2:22½; also of Patronage, sire of Alix, 2:16½, and Mary Mambrino is dam of Elvira, 2:18½, at four years old. Patron is sire of Stamina, 2:26½. Brown Wilkes, 2040, record 2:21¾, is the next stallion in the catalogue; by George Wilkes; dam Jennie Irving, by Henry B. Patchen; second dam by Witherell Messenger. Brown Wilkes made his first season in 1885, and has three 2:30 performers. Nuggett, 1398, record 2:26¾, is by Wedgewood, 2:19, dam Minerva, by Pilot Jr.; second dam Bacchante Mambrino, by Mambrino Chief; third dam Bacchante, by Downing's Bay Messenger. Nuggett has eight 2:30 performers with records from 2:16¼ to 2:29¾. Mar Caspio, 7619, is the only stallion for service without a record of 2:30 or better, but his breeding is full of choice performing and producing blood. He is by Director, 2:17; dam Kate Nutwood, by Nutwood; second dam Kate (dam of Homestake, 2:14), by Volunteer; third dam Jennie (dam of Powers), 2:21, by Seely's American Star. Connaught, 2432, record 2:24, is by Wedgewood, dam Consuella, by Harold; second dam Young Portia, by Mambrino, and is sire of Clonmore, 2:27¾. Monte Carlo. 2429, record 2:29¾, is a son of Monaco, by Belmont; dam Bicara (dam of Pancoast, 2:21¾), by Harold; second dam Belle, (dam of Belmont), by Mambrino Chief, he is sire of Moerlein, 2:28¾. The last stallion on the list is Hermes, 548, record 2:27½; dam Hermosa, by Alexander's Edwin Forrest; second dam Black Rose, by Tom Teemer. Hermes is sire of five 2:30 performers, and five others with records of from 2:30½ to 2:35½. The list of brood-mares is too long for extended mention. Like the stallions, their pedigrees are full of developed and producing speed lines. Mattie Hunter, 2:12¾, pacing; Annie W., 2:20; Secret, 2:20½; Katie Middleton, 2:23; Nettle Leaf, 2:23½; Hoodwink, 2:25; Cascarilla, 2:25½; Canilla, 2:28¼; and Bertha S., 2:29¼, are those with fastest records. Belle of Cayuga, Zelinda Wilkes and ten others have produced one or more 2:30 performers, and, as previously stated, more than a score of others are out of producing dams. The believers in developed speed will find plenty of it at Forrest City Farm, combined with the richest

Digitized by Google

and most fashionable trotting strains. Twenty-five highly-bred mares, with nearly one hundred colts and fillies from yearlings up are included in the sale division of the catalogue, all of them by the stallions and out of the mares mentioned above. The stallions are offered for public service from March 1 to September 1.

Forrest City Farm is situated at Randall Station, ten miles from Cleveland, Ohio, Visitors are cordially invited, and by notifying the office or farm, conveyances will be sent to Randall depot to meet them.

CLAIREVIEW STOCK FARM.

The catalogue of this important breeding establishment is one of the most beautiful, comprehensive and correct compilations of the kind issued this year. It is replete with useful information and valuable statistics, also contains pictures and maps of Claireview and surroundings, in addition to handsome engravings of the most representative animals on the farm. The descriptive matter following the tabulated pedigree of the leading animals is not only a careful statement of their individual performances and characteristics, but a succinct and valuable history of the trotting families represented in their breeding. The total number of animals so described is eighty-six, including stallions, brood-mares, colts and fillies of the most approved and fashionable strains of trotting blood. The stallions offered for public service at Claireview are eight in number, as follows: Antevolo 7648, record 2:19½, by Electioneer 125, dam Columbine, by A. W. Richmond, (dam also of Anteeo 2:16¼ and Coral 2:25). Wheeling Wilkes 7761, record 2:32½, dam Lady Rand, by Edward Everett. Harrogate 3525, by Harold 413, dam Dahlia (dam of Daireen 2:21½, Dacia 2:29½ and Davenant 2:26¼), by Pilot Jr. 12. Claire Bell 13221, by St. Bel 5336, record 2:24½, dam Dongola, by Onward 1411, second dam Embassy, by Harold. Alston 11135, by Red Wilkes 1749, dam The Jilt, by Shelby Chief 923, second dam by Forrest King 1754. Lord Claire 9628, by Benefactor 4009, record 2:28, and full brother to Superior 2:17¼, dam Lola (dam of Cosher 2:30), by Administrator, second dam Abutillon, by Belmont. Varney 9629, by Combat 1038, dam Westwood, by Egbert 1136, second dam Steele Grey, by Blackwood 74; and Mapoline 11134, by Louis Napoleon 207, dam Hattie Mapes, by Abdallah Star, second dam Fanny Mapes (dam of Jerome Eddy 2:16¼), by Alexander's Abdallah. These eight horses have been selected for their individual merit as well as their breeding. Forty brood-mares have been secured by the proprietors of Claireview to mate with these highly bred stallions, all standard and by such well-known sires as Bonnie Wilkes, Electioneer, Gen. Washington, Capoul, Combat, Dictator, Onward, Nutwood, Sweepstakes, Louis Napoleon, Guy Wilkes, Jerome Eddy, Red Wilkes, Piedmont, Gen. Benton, Masterlode, Benefactor and Happy Medium. No less than forty-eight of the great brood-mares are represented in pedigrees of the sires and matrons at Claireview, and the colts and fillies for sale, thirty-eight in number, are offered at bottom prices considering their breeding and quality. Claireview farm contains 600 acres, situated on Lake St. Clair, about eleven miles from the city of Detroit, Mich., easily accessible by street railway and motor line. Full and complete directions to visitors and shippers are contained in the catalogue. The post-office address is Claireview, Wayne county, Mich., and telegraph address, Detroit, Mich. Visitors are cordially welcome.

Our New Advertisers.

The Stallion Service Book, advertised by the Northwestern Live Stock Insurance Co., Des Moines, Iowa, is one of the most complete books of the kind published by it.

Wilfred Page, Penn's Grove, Sonoma Co., Cal., offers for public service his highly bred Electioneer stallion, Eclectic, full brother to Arion, two-year-old record 2:10¾. Write for catalogue.

The Owen Electric Belt & Appliance Company, the largest establishment of the kind in the world, call attention in this issue to the special adaptability of their specialty to the needs of horsemen.

Among the many articles invented for the convenience of horsemen, the Perfection Horse Tail Tie, is one of the cheapest and most useful, especially during these muddy spring months. Manufactured by the Des Moines Novelty Co., Des Moines, Iowa.

N. B. Richards, of Galesburg, Ill., is the fortunate owner of Roscoe Conklin 8025, record 2:30, by Governor Sprague, 2:20½; dam Bertie, 2:27, by Blue Bull; second dam by Tom Crowder. This is developed speed on both sides, as well as prepotent and performing ancestors.

Digitized by Google

Gov. Sprague is sire of thirty-two performers in 2:30, or better, and Bertie, by Blue Bull (sire of over sixty 2:30 performers), is also dam of Gertie, 2:33. At $50 per season the breeders of Central Illinois should rapidly fill the book of Roscoe Conklin, 2:30.

Hugh Brien, 480, 482 Ninth avenue, New York, is justly proud of his highly bred stallion, Hudson Boy 10868, by Guy Wilkes, dam by Del Sur, second dam by The Moor. These are the strains of blood that have given to the trotting world many early and fast performers. As an incentive for those who breed to his horse to train and develop their colts, Mr. Brein offers $150 to the first colt or filly to enter the 2:30 list, $100 to the second, $50 to the third. Hudson Boy will make the season of 1892 at East Williston, L. I., N. Y.

Walsingham 2166, record 2:35, trial 2:28¼, is one of the tried and successful sons of George Wilkes, and his dam, Neilson, by Mambrino Pilot, is one of the great brood-mares, being also dam of Prospect Maid, 2:23½; Georgia Wilkes, sire of three in 2:30 or better, and Beverly Wilkes, sire of one in 2:30. Walsingham has sired Latitude, 2:19¾; Mount Airy, 2:30; Naboth, 2:31¼, and a number of others with records up to 2:40, also of two fast yearling performers. This well-bred horse is owned by H. F. Calef, Monticello, Ill.

B. C. Armstrong & Co., of Hoosick Falls, N. Y., offer a trio of high-class stallions for public service in Pharas, Acteon and Delmonico Sprague, and the terms are so liberal that there is no excuse for breeders in their vicinity patronizing horses of unknown or inferior lineage. Pharas 3877 is by Phallas, dam Hoosier Girl, by Blue Bull; Acteon 3876, by Alcantara, dam Adalia, by Administrator, 2d dam by Gill's Vermont; and Delmonico Sprague 2818, by Gov. Sprague, dam Flora, by Delmonico, 2d dam by Old Tom Crowder. The advertisement gives full particulars.

The vehicles manufuctured by the Wayne Sulkyette and Road Cart Company, Decatur, Ill., are so well illustrated in their full page advertisement that little remains to be said. The sulkyette is one of the most popular track vehicles for all purposes short of actual racing, and horsemen who have used them for jogging or speeding are unanimous in commendation. The jogging cart is also a great improvement on the ordinary vehicle made for that purpose. The Wayne Sulkeyette and Road Cart Company is a thoroughly honorable and reliable business house, and none but the best material enters into the manufacture of any of their goods.

Cuyler 100, by Hambletonian 10; dam Grey Rose, by Hambletonian 2, is one of the most successful sons of the old Hero of Chester. He was the favorite stallion of the late J. C. McFerran, of Glenview, Ky., who bred him to some of his choicest brood mares. He has fourteen 2:30 performers, and a large list of producing sons and daughters, and, although foaled in 1868, is as strong and vigorous as a colt. Undoubtedly the purchase of Cuyler was a great acquisition to the breeding interests of Iowa. He is owned and offered for public service by Tom James, Des Moines, Iowa, who also owns the royally bred Wilkes stallion, Lord Wilkes, by Baron Wilkes, 2:18; dam Nathalie, by Nutwood, 2:18¾; second dam Beatrice (dam of Patron, 2:14¼), by Cuyler. Fast records bristle in this horse's pedigree.

The annual announcement of South Elkhorn, R. P. Pepper & Son, Frankfort, Ky., appears in this issue of the MONTHLY. The great Wilkes stallion, Onward, is at the head of the stud. One of the most prepotent and successful sons of Geo. Wilkes, with forty-five in the 2:30 list, ten producing sons and five producing daughters, his services are comparatively cheap at $500. Norval, 2:17½, by Electioneer, sire of Norhawk, 2:20½ at three years; Novelist, 2:27 at two years, and Norlaine, yearling, 2:31½; Madrid, by George Wilkes, sire of Cognac, 2:20½, and Charley R., 2:30; Nutpatch, by Nutwood, dam Patchen Maid, by Mambrino Patchen, and Striker, by Onward, out of the dam of Catchfly, 2:18¼, are the other stallions offered for public service at South Elkhorn, and they make with Onward a quintette in blood and performance equal to the requirements of the most exacting breeder of light harness horses. Choice standard bred stock for the track or stud is always for sale.

OUTSIDE of the breeding problem, there is, perhaps, no other one thing that so greatly occupies the minds and attention of horsemen as the track sulky. After the breeder has spent years in trying to breed a fast trotter or pacer, his next move is to buy and use such a sulky in which his horses can be driven to their limit of speed. That the sulky plays a very important part in the success or failure of a horse's turf career, can not be disputed. With-

Digitized by Google

in the last decade the track sulky has been wonderfully improved. No other sulky has greater publicity and is more extensively used among the best class of horsemen than the Truss Bar and Truss Axle, manufactured by the old established and reliable firm of S. Toomey and Co., Canal Dover, Ohio.

In this sulky are embodied all the modern and mechanical principles, and the many advantages derived from their use have manifested themselves in many ways, and need no comment. The genius, S. Toomey, still heads this firm, and devotes his time in making new improvements, and adds such devices from time to time as may materially assist the horse in his struggles for prestige. The firm have recently made a large shipment of Truss Axle sulkies and skeleton wagons to Berlin, Germany, where their name and sulkies are as well known as here, some of the fastest records made in Europe being in the Truss Axle sulky. Consequently, with such a showing, S. Toomey & Co. are bound to command the patronage of the progressive horseman of the future.

The Standard.

AS REVISED AND ADOPTED BY THE AMERICAN TROTTING REGISTER ASSOCIATION, MAY 19, 1891.

IN order to define what constitutes a standard-bred horse and to establish a BREED of trotters and pacers on a more intelligent basis, the following rules are adopted to control admission to the records of pedigrees. When an animal meets the requirements of admission and is duly registered it shall be accepted as a standard-bred animal:

First. Any Trotting Stallion that has a record of two minutes and thirty seconds (2:30), or Pacing Stallion that has a record of two minutes and twenty-five seconds (2:25), or better, provided any of his get has a record of 2:35 trotting, or 2:30 pacing, or better; or provided his sire or dam is already a standard animal.

Second. Any mare or gelding that has a trotting record of 2:30, or pacing record of 2:25, or better.

Third. Any horse that is the sire of two trotters with records of 2:30, or two pacers with records of 2:25, or one trotter with a record of 2:30, and one pacer with a record of 2:25, or better.

Fourth. Any horse that is the sire of one trotter with a record of 2:30, or one pacer with a record of 2:25, or better, provided he has either of the following additional qualifications: 1.—A trotting record of 2:35 or a pacing record of 2:30, or better. 2.—Is the sire of two other animals with trotting records of 2:35, or pacing records of 2:30, or one trotter with a record of 2:35, and one pacer with a record of 2:30, or better. 3.—Has a sire or dam that is already a standard animal.

Fifth. Any mare that has produced a trotter with a record of 2:30, or pacer with a record of 2:25, or better.

Sixth. The progeny of a standard horse when out of a standard mare.

Seventh. The female progeny of a standard horse when out of a mare by a standard horse.

Eighth. The female progeny of a standard horse when out of a mare whose dam is a standard mare.

Ninth. Any mare that has a trotting record of 2:35, or a pacing record of 2:30, or better, whose sire or dam is a standard animal.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each: to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal.* The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ADDIE WOOD, (7) ro m foaled 1887; by Admiration 11415; dam Kitty W., by Hambletonian 572. [See Kitty W., Vol. VIII.] Bred by Hubbard Cotton, passed to William Crandall, Friendship, N. Y. [Vol. X.]

AGUARELLA, (6) b m foaled 1890; by Prince Alfred, 5262; dam Rye Mark, by Victor Bismarck 326; g d Brownie, by Ryland, 3580, etc. [See Rye Mark, Vol. IX.] Bred Bred by Charles Stapf, Wampum, Pa. [Vol. XI.]

ALLEGANY BELLE, (7) b m foaled 1891; by Pocahontas Medium 4326; dam Belva Lockwood, by Alleghany Boy 3401. [See

PINKERTON 6689, (6) ch h foaled 1884; by Hambleton 1221; dam Olivet, by Blue Grass 382, etc. [See Vol. VII.] Passed to T. W. Whitney, St. Louis, Mich.; then to W. J. Flynn, Akron, N. Y.; then to A. G. Flynn, Akron, N. Y., 1889.

POCOSON 14812, (6) b h foaled 1890; by Prince Belmont, 3878; dam Cora, by Robert Medium 4827, etc. [See Vol. X.] Passed to M. B. Rowe, Fredericksburg, Va.

PORTER 8812, (6) b h foaled 1887; by Wilkie Collins 3901; dam Alide, by Rothschild 495, etc. [See Vol. VII.] Passed to R. L. Howard, Buffalo, N. Y.; then to W. J. White, Cleveland, Ohio.

PROTEUS 10741, (6) b h foaled 1887; by Balaklava 1853; dam Phallas Maid, by Phallas 1446, etc. [See Vol. VIII.] Passed to W. H. Fares, Emerson, Manitoba, Can.

PULLEN 9547, (6) gr h foaled 1887; by Gen. Wilkes 8493; dam Mamie Hambletonian, by Squire Talmage 668, etc. [See Vols. VIII and IX.] Passed to W. R. Snyder, Hastings, Neb.

QUAKER 11857, (6) b h foaled 1889; by Princeton 2513; dam Viva, by General Knox 140, etc. [See Vol. IX.] Passed to Buford & Tarlton, Lexington, Ky.; then to J. R. Johnson, Spring Valley, Minn.

RAVENSCRAG 11221, (6) b h foaled 1889; by Dispatch 4480; dam Clara R., by Strathmore 408, etc. [See Vol. VIII.] Passed to W. H. Smith, Princeton, Ind.; then to Estes Bros., Opdyke, Ill.

Digitized by Google

ROLLA 4380, (6) b h foaled 1883; by Administrator 357; dam Grace Galloway, by Happy Medium 400, etc. [See Vol. VI.] Passed (1886) to Charles McFadden, Trevanion, Pa.

ROLL CALL, (7) b m foaled 1888; by Reveille 1472; dam Harrison Maid, by Harrison Chief 3841, etc. [See Vol. IX.] Passed to Polk & Brown, Ashwood, Tenn.

RIPPLE, (6) b m foaled 1886; by Prompter 2305; dam Grace (dam of *Creole*, pacing record 2:20), by Buccaneer 2656, etc. [See Vol. VIII.] Passed to Frank H. Burke, San Francisco, Cal.

RUSH, (7) br m foaled 1890; by Pluto 1950; dam Andy Girl, by Highland Chief 8227. [See Vol. X.] Passed to Edwin Harris, Mt. Ayr, Ind.

SADELLA, (8) ch m foaled 1889; by Madrid 1835; dam Ella D., by Vidette, son of Vindex, etc. [See Vol. IX.] Passed to Vail & Patrick; then to F. G. Vail, Marengo, Ill.

SANTA RITA, (7) br m foaled 1885; by Sidney 4770; dam Titania, by Buccaneer 2656, etc. [See Vol. IX.] Passed to W. J. White, Cleveland, Ohio.

SCHOOL GIRL, (6) b m foaled 1889; by Aberdeen 27; dam Patsy F. (dam of Waymart, trotting record 2:27¼), by Mambrino Patchen 58. [See Vol. X.] Passed to S. A Browne & Co., Kalamazoo, Mich.; then to William P. Maloney, Park Ridge, Ill.

SEVILLE, (7) b m foaled 1884; by Madrid 1835; dam Patti, by Mambrino Chief 11, etc. [See Vol. VI.] Passed to Cowan & Michael, Ottumwa, Iowa.

SHADELAND PRINCE 8389, (6) b h foaled 1887; by Wilkes Nutwood 8000, dam Roxy, by Enchanter 468, etc. [See Vol. VII.] Passed to J. H. Cartwright, Oregon, Ill.

SPITE, (7) br m foaled 1887; by Falkenberg 3063; dam Pique, by Dictator 113, etc. [See Vol. VII.] Passed to H. C. England; then to L. V. Halberstadt, Reading, Pa.

STARLING, (6) b m foaled 1884; by Volunteer Star 1614; dam Kate Forrest, by Edwin Forrest 3532, etc. [See Vol. VIII.] Passed to Wilson Bros., Cave City, Ky.

STARWARD 15620, (6) br h foaled 1890; by Regent 2681; dam Zelda, by Star of the West 666, etc. [See Vol. X.] Passed to O. N. Ainsworth & Co., Sloan, Iowa.

SURPRISE, (6) gr m foaled 1884; by Rooker 7415; dam (dam of Nelly Woodruff, trotting record 2:30), pedigree not traced. [See Surprise, Vol. X.] Passed to William Gregor, Windsor, Ont., Can.

TENTABIT 15840, (6) gr h foaled 1885; by Pilot Medium 1597; dam Minnie Hoag (dam of Lady Belle, trotting record 2:28¼), by Bay Middleton 2850, etc. [See Vol. X.] Passed to J. F. Church, Denver, Colo.

THORNEMONT 12506, (6) b h foaled 1889; by Wimbledon 3564; dam Dell Thorn, by Hero of Thorndale 549, etc. [See Vol. IX.] Passed to Wagoner Bros., Sterling, Kas.

TITO 8840, (7) b h foaled 1887; by Egbert 1136; dam Laura, by Billy Adams 3601, etc. [See Vol. VII.] Passed to Estate of R. West, Lexington, Ky.; then to James W. Fitzgerald, Maysville, Ky.; then to J. T. Long, Lane, Kas.

TRICOTINE 6486, (7) b h foaled 1886; by Tramp 308; dam Rosa Hatch, by General Hatch 139, etc. [See Vols. VII. and X.] Passed to Simon M. Beachy, Falls City, Neb.

ULSTER CHIEF 18011, (4) b h foaled 1863; by Hambletonian 10; dam Lady Ulster, by Dunkin Mambrino, etc. [See Vol. I.] Passed 1874, to Josiah Sessions, Oakland, Cal. Died in 1890. Sire of Niles Beauty, trotting record, 2:25¼.

WAR FLAG 13917, (6) ch h foaled 1890; by Warpaint 9287; dam Rose Clay, by American Clay 34, etc. [See Vol. IX.] Passed to Frederick Kessler, Dodgeville, Wis.

WAYFARER 8392, (7) b h foaled 1887; by Wilkes Nutwood 8000; dam Evoleen, by Satellite 2500, etc. [See Vol. VII.] Passed to W. K. Orr, Kingston, Ohio; then to J. A. Hall, Mt. Sterling, Ohio; then to J. Hamlet Allen, Ottawa, Ont., Can. October 5, 1891.

WILDFIRE 15204, (4) br h foaled 1868; by Volunteer 55; dam by Morse Morgan, etc. [See Vol. X.] Passed to Frank E. Shaw, Dunkirk, N. Y.; then to Jacob Eysinger and J. T. Shirley, Warren, Pa., June 23, 1890.

YOUNG DUKE 14769, b h foaled 1890; by Maximus 5175; dam Blanche Star (dam of Annie S., trotting record 2:26, and Almont Star, trotting record 2:28¾), by American Star 37, etc. [See Vol. X.] Passed to E. S. Hartman, Cleveland, Ohio.

ZERLINA F., (7) ch m foaled 1889; by Col. Tom 6415; dam Laura W., by Great Western, 5663, etc. [See Vol. IX.] Passed to E. O. Shaw, Newaygo, Mich.

THE METHODS OF PALO ALTO.

BY S. T. H.

II.

THE annual volume, averaging three hundred pages, of breeding stock and its produce, issued by the proprietor of Palo Alto, is the text book that reveals its laws of trotting-horse production. The published interviews of Senator Stanford are like explanatory marginal annotations. In both the same persistency of purpose, the well-settled conclusion from theoretical and experimental deductions are manifest. The success of Palo Alto is built upon what its owner deems to be the correct laws of reproduction as immutable in heredity and physiology as are the foundations of the rock of Gibraltar in the depths of the sea. All other aids to development, such as the miniature track for weanlings and yearlings, the least possible encumbrances on the feet and limbs, demanding the absolute banishment of heavy shoes and toe weights, as means of balancing the action, and the highest professional skill of the trainer's art are constantly employed; but in comparison with the laws governing the production of the Palo Alto trotters, these are merely the subsidiary aids to success. These laws all revolve around one conception—*blood*. Nerve force and physical conformation are desirable, probably necessary, but thoroughbred blood is the absolute prerequisite, without which, in the judgment of its profoundly studious proprietor, Palo Alto can not maintain its supremacy as the leading trotting-horse stock farm of the world. In this position he antagonizes nearly all the great trotting-stock establishments, and opposes all the influential trotting authorities of past and contemporaneous turf literature. This law is the constant infusion of thoroughbred blood; not in the grandam, as maintained by the late Lord Alexander, of Woodburn; not as a foundation in the third or fourth remove of ancestry, as contended for by the late Gen. W. T. Withers, of Fairlawn, but closer up, as near and as much as possible to the trotting action and to the trotting inheritance, as can be injected, without diminishing or obliterating these prerequisites. This can be done, he claims, by the use of thoroughbred dams for trotting-brood purposes, provided those dams have good trotting action, and are the daughters of thoroughbred sires, whose lineage has commingled successfully with trotting pedigrees. To substantiate this position he points to Palo Alto, 2:08¾; Ansel, 2:20; Azmoor, 2:20½; Express, 2:21, and ten others, all being the produce of thoroughbred matrons. He goes further. He contends that these trotting horses out of thoroughbred mares will not only produce great performers out of trotting-bred mares, as already proved by Ansel's three standard trotters. but that they will produce phenomenal trotting speed and stamina, when mated with thoroughbred mares; for he has stinted, as recorded in his catalogue, thoroughbred Helpmate to half-bred Azmoor, 2:20½, and Kitty by Exchequer—the sire of two standard trotters—to Whips, 2:27½, by Electioneer, out of Lizzie Whips, by Enquirer, the son of Leamington. He predicates this conclusion upon these facts.

Digitized by Google

In both lines of thoroughbred blood, therein united, there is positive trotting excellence. Thus: Enquirer was by imp. Leamington, out of Lida, by Lexington. Lexington, although the greatest four-mile running horse of his day, yet furnished the grandams of Sunol, 2:08¼, Maud S., 2:08¾, Jay-Eye-See, 2:10, one-eighth of the blood elements of Clingstone, 2:14, Electricity, 2:17¾, and one quarter of Ansel, 2:20, Nora Belmont, 2:27¼. Temple, 2:30, and Lady Prewitt, 2:30, while Lexington's son, Woodburn, not only sired Monarch, 2:28, but Emma Robson, the dam of Emaline, 2:27½. Exchequer, the thoroughbred sire of Lucille, 2:21, and Rigolette, 2:22, was by Revenue, the sire of Planet, who, in turn, sired Dame Winnie, the thoroughbred dam of Palo Alto, 2:08¾, Gertrude Russell, 2:23⅛, and Big Jim, 2:23⅛, and also sired Helpmate, the thoroughbred dam of Hugo, 2:27½, while Revenue was the son of imp. Trustee, who sired the chestnut gelding, Trustee, that trotted twenty miles in 59 minutes, 35⅛ seconds as early as the year 1848. All of the thoroughbred mares used for trotting brood purposes at Palo Alto have the heraldry of trotting action and record producing performances that sustain, to the satisfaction of its proprietor, and justify him in founding upon the thoroughbred basis this great establishment. Trotting purists, like the founder of the Trotting Registers, Mr. John H. Wallace, contend that this is merely "running foolishness," at variance with the law that the only certain method of producing trotters with uniformity, that will eventually become a type so full of trotting inheritance, with no diluting outcrosses, that in their perfect state, they will never break from the extreme trot to the galop, is to breed trotters to trotters, developed trotters to developed trotters, of the most extended trotting pedigrees; for the law of inheritance is as absolute as it is universal, that "*Like produces like, or the likeness of some ancestor.*" This position is also maintained and acted upon by the great body of trotting-horse breeders. Palo Alto stands practically alone in this contention as to the correct principles of breeding the trotter endowed with the very highest capacity for speed. But it stands firm and self-reliant. It points to its record for proof. It has not only the champion stallion record by one of its number out of a thoroughbred dam, but fourteen others, with records from 2:20 to 2:29¾, similarly bred! These surprising results have all been accomplished within fifteen years. There are forty-eight thoroughbred mares and sixty-one half bred, and two hundred and forty-seven trotting and pacing-bred mares used for trotting matrons at Palo Alto. The thoroughbreds number one-eighth of the entire lot, yet they have produced nearly one-seventh of the standard trotters to the embrace of the great premier, Electioneer, and the second fastest record in existence, that of Palo Alto. The half-bred brood mares mount up to sixty-four, somewhat over one-fifth of the number, yet they have produced one more than one-fourth of the charmed one hundred standard trotters, including the world's record of Sunol, 2:08¼. The trotting and pacing-bred matrons are two hundred and forty-seven, more than two-thirds of the entire complement, yet they have produced six less than two-thirds of the one hundred standard trotters, a less proportion than either the thoroughbred or half-bred dams, with the third, or poorest position with reference to extreme speed, that of Arion, 2:10¾. These are the statistics furnished by the greatest trotting horse experimental breeding station in the world. Whether the preponderance will continue in favor of half and quarter-bred mares can not be determined by the present history of Palo Alto, for it is comparatively in its infancy. The speed of pure-bred trotters, at the ranch, is greater, at the same age, than that of either the half or quarter-bred ones, and the trotting-bred brood mares have presented several examples of producing, individually, more standard performers than any in the two former classes. But the average results, considering the incipiency of the test, are sufficiently encouraging to warrant Senator Stanford in these utterances:

"*It did not take me long to appreciate that plug* (cold) *blood did not produce speed. I am therefore eliminating all traces of cold blood as fast as circumstances will permit.*"

Digitized by Google

This statement will not bear a rigid construction. The catalogue does not evince a disposition to eliminate all trotting blood and pacing blood that does not trace directly to a thoroughbred ancestry. But it shows a tenacity to acquire and retain speed-producing dams and to assume their blood elements from ulterior facts. Thus the little pacing pony, Mayflower, sired by St. Clair, the pacer, out of an unknown dam, savors strongly of "plug" blood, yet in a note she is described as a "performer of a high order, and as a brood mare stands second to but few, if any, in the land," an encomium she has well earned through her daughter, Wildflower, two years old, record 2:21, and Manzanita, four years old, record of 2:16. The powerful gray mare, Lucy, one of the great pacing quartette with Sleepy Tom, and Mattie Hunter, and Rowdy Boy, in the early eighties, is also retained, though she has no pedigree. But omitting notable exceptions like these, preference is given to thoroughbred crosses. Palo Alto has bred and now retains twenty-two half-bred stallions! These are being mated quite extensively, with highly bred mares, some of them having a preponderance of thoroughbred blood! Of course there is an appreciative estimate, beyond the fixing of a price of such purely trotting-bred young sires as Advertiser, three years old, record of 2:16, by Electioneer, out of Lula Wilkes, second dam Lula, 2:15, by Alexander's Norman, and Electricity, seven years old, record of 2:17¾, by Electioneer, out of Midnight, by Pilot Jr.—the dam of Jay Eye See, 2:10, and Noontide, 2:20¼. Their employment with some of the most successful trotting-bred matrons, as well as the half-bred mares on the farm, plainly indicate that the thoroughbred, though it may be gifted with great trotting excellence, is not designed to supplant the successful trotter, bred in trotting lines exclusively, even in the distant future. This inference is further enforced by the fact that Palo Alto and the other half-bred sires are generally mated with trotting-bred dams, carrying the blood of Piedmont and Nephew and Gen. Benton, while the pure trotting-bred sires are largely used in connection with half and quarter-bred matrons. But the comprehensive conclusion from a careful examination of the crossings of both classes is fairly reached, when it is stated that the primal law of breeding trotters at Palo Alto is to infuse as much thoroughbred blood as possible in the progeny from both sire and dam as is compatible with the preservation and the development of trotting speed. The most recent combinations, as recorded in the catalogue for 1891, indicate that three-quarters of thoroughbred blood can be infused without diminishing the trotting inheritance or the trotting speed. If Palo Alto, with its vast resources of blood elements, endowment fund, and learned professors can compass this result, it will work a complete revolution in the present extremely prosperous methods of producing the swift-trotting horse.

"Extreme speed, Senator Stanford as-"serts, comes from breeding, physical "conformation and nerve force." This general proposition can not be gainsaid. Its application alone provokes contention among trotting-horse breeders. They admit that his thoroughbred mares have these qualifications in an eminent degree, for they have the choicest of blood elements, the highest possible physical conformation, and a superabundance of nerve force. But are these in the line of trotting progression? The problem that Senator Stanford has raised among many trotting breeders and the owners to solve, which he has placed upon Palo Alto, is, whether the physical structure and the mental traits or inheritance of the thoroughbred are in furtherance of the still greater development of trotting potency? The ambition for speed may be granted to be even greater in the mind of the running horse than in that of the trotter, for the sufficient reason that the gallop enables him to attain a greater momentum, but when he changes his action his physical structure is regarded as so little adapted to the diagonal movement, that it is generally conceded the thoroughbred trots with an awkward, stiff-knee action, which is painful when compared with his graceful leaping action that has long been typified as the poetry of motion.

Digitized by Google

Governor Stanford concedes that this

ungainly trot must be changed, in the thoroughbred brood mare devoted to trotting maternity, into pronounced trotting action. "All my thoroughbred "mares, he says, designed for trotting "brood purposes, could trot. It was the "speed shown by Palo Alto's dam at the "trot that led me to buy her." This is, undoubtedly, an important advantage in the thoroughbred brood mare, as it assists the trotting potency of the trotting sire, when mated with a thoroughbred mare gifted with trotting action, to perpetuate, the more easily, the trotting action in the progeny. Nowhere, either in theory or in practice has the master mind of Palo Alto ever ventured to use the thoroughbred sire to beget trotters, even from the most successful of speed-producing trotting dams. In the earlier periods of the trotting problem, thoroughbred sires have been tried with indifferent success. Woodburn, the home of the very choicest thoroughbred and trotting-bred sires, has furnished the best though not ample means for testing this experiment, with no less competent an authority to make the selections than the late R. A. Alexander himself. Mr. L. Brodhead, the very able manager of Woodburn, writes to the author about the trotting capacity of the great thoroughbred sires on the farm, during its eventful epochs, in these words:

"Lexington, I do not think, had "much trotting action. His blindness "would have prevented him being tested "at that gait. Planet had good action, "and is reputed to have had some speed. "*Imported Scythian had enough action* "*to justify Mr. Alexander in breaking* "*him to harness, but, unfortunately, he* "*was killed before he could be trained.* "Imported Australian had better trotting "action than any thoroughbred I have "ever seen. He opened out well, and "liked to trot."

In this connection it is pertinent to remember that Lexington had the least trotting action, and that none of his daughters are in the great trotting-brood-mare list, either at Palo Alto or elsewhere; while both Planet and imp. Australian had exceptionally good trotting action, and, consequently, their daughters are represented in the list of great producers of extreme trotting speed. Thoroughbred blood in the present crystallized period of trotting pedigrees can be considered under three phases, namely: The use of the thoroughbred sire with trotting-bred dams, thoroughbred matrons with trotting sires, and one thoroughbred cross, that of the grandam, with two trotting crosses, the trotting-bred sire with the half-bred dam.

Whether the use of the thoroughbred sire with trotting dams, or even with thoroughbred mares—providing both sire and dam are gifted with pronounced trotting action, will ever obtain at Palo Alto, is only problematical. If the thoroughbred filly Governor Stanford has named "Experiment" develops into a trotter of moderate speed, so fascinated has he become with thoroughbred blood in the trotter that he may push his empiricism to the extremity of employing a thoroughbred sire for trotting-stock purposes. He certainly has some warrant "in trotting turf history for this experiment," and all of his experiments, however costly they may prove, will redound to the ultimate solution of the trotting problem.

So composite has been the lineage of standard trotters, that some have been sired by thoroughbred stallions. Imported Bonnie Scotland produced Scotland, record 2:22½ out of the pacing-bred mare Waterwitch, by Pilot, Jr., a son of imported Trustee, whose lineage appears in the blood lines of many noted trotters, sired John Nelson out of the Redmond mare by Abdallah 1, and he has become the sire of four standard performers. Exchequer, by Revenue, the pure-bred son of imp. Trustee, out of Nina by Boston, has sired two standard performers, both being out of pacing-bred mares; while Chenery's Gray Eagle, through his breeding is given as unknown by Mr. Wallace, yet it is certified to by the late Mr. O. B. Gould, of Franklin Furnace, Ohio, a breeder of probity, accuracy, and intelligence, as by Gray Eagle, son of Woodpecker, dam by imp. Trustee, not only made a trotting record of 2:31 and two miles to wagon in 5:09½, but he is the sire of two in the standard list out of mares of unknown breeding. If, therefore, the experiments at Palo Alto

had gone so far as to have tested the capacity of a thoroughbred sire to produce trotters, there would have been some earnest of, at least, limited success. But the record shows neither a numerous trotting progeny nor extreme speed from this method of breeding, both of which conditions may be too highly prized at Palo Alto for its owner to ignore in his breeding tests.

The records stamp the thoroughbred sire of trotting produce as a comparative failure. Neither Palo Alto nor any other breeding establishment at the present advanced stage of solution of the breeding problem would probably waste much time or treasure in prosecuting a method so barren of results as the use of the thoroughbred sire in the trotting harem, no matter how great may be his trotting disposition or perfect his trotting action, or successful, as trotting matrons, his thoroughbred daughters.

Perhaps the most satisfactory test of this experiment was had in the case of Ringmaster, the thoroughbred son of Ringgold, which came within the writer's personal knowledge.

Although Ringmaster was a superb race horse, at all distances, from one to four miles and repeat, yet he was fond of trotting, and his trotting action often reminded the author of that splendid description of the trotting movement of imported Messenger, as portrayed by the late David W. Jones in the *Spirit of the Times*, under the *nom de plume* of Long Islander. There was the same "beautiful roll of the knee" and the same "widening behind, just sufficient to clear his front limbs and feet," and the same "bold, resolute earnestness when at full trotting speed." Like Messenger, he was low over the withers, to which conformation the trotting pitch has been attributed, and which is plainly delineated in the portrait of his sire, the English Mambrino, by the famous Stubbs, the best animal painter of England in his century.

While Ringmaster was taking his exercise one morning at the old Buckeye course near Cincinnati, his persistency to maintain the trot was so marked that his owner, the late Edward Smith, commanded the jockey to ride him a mile up to his speed on the trot without forcing him into the gallop. *Many horsemen were present, the writer among the number, all of whom mounted the judges' stand and timed him from start to finish in exactly three minutes and three seconds.* Our watches all agreed. None made it as slow as three minutes and four seconds! This was considered so remarkable a performance that when his racing days were over he was purchased by Mr. Chester M. Poor, a roadite of the Queen City, for service as a trotting sire. He was broken to harness and driven for years as a roadster. His trotting action was as perfect to harness as when under saddle in the trial above narrated; *but he never exceeded that rate of speed, although trained for an entire season by an expert on the fair ground half-mile course at Carthage.* When the jockey placed upon his head the open bridle and prepared to mount, he was as full of spirit and fire as imported Glencoe, but when the blind bridle was shown him, and his vision was narrowed by the blinders, his ears would sullenly drop, his flag would lower, and his entire crestfallen dejection plainly showed how keenly he felt the humiliation of his transformation from the fleet-footed freedom of the high-mettled racer to the restricted drudgery of the routine roadster. This expression of humiliation was so marked that the bridles were often exchanged by the owner simply to show visitors the degree of Ringmaster's intelligence. The same expression of humiliation marked the pair of Australian geldings that formed the hackney team at Woodburn to draw visitors to and from the station during the lifetime of the late Mr. R. A. Alexander.

Ringmaster was largely patronized. The success of other thoroughbred sires, with pacing matrons, induced the owners of fast pacers, like Gipsey Queen, to breed to him. Trotting mares of decided merit in speed, daughters of Stockbridge Chief and Dolphus, and Mambrino Star were bred to him for many seasons. His progeny was numerous, possessing fine size, elegant style, notable power, and fair trotting action; *but none of them ever became standard trotters.* Indeed none could trot a mile in two minutes

and forty seconds. If the many other instances of the use of thoroughbred stallions for trotting service could be authentically recorded they would satisfactorily account for the small number that have forced themselves into the Great Table of standard sires, and probably explain why such profound students of the trotting problem as the late R. A. Alexander and the living Senator Stanford never employed them in the trotting harems of Woodburn and of Palo Alto. But if, perchance, the buoyant success of the prince of trotting-horse breeders with thoroughbred mares will lead him to make this experiment, with thoroughbred sires, his conclusions on the large scale, which Palo Alto affords, will determine this phase of breeding, the writer firmly believes, in the negative, for all future ages.

But this leading breeding farm is testing the experiment closely allied to this extreme view. It is now breeding the half-bred Palo Alto to choice trotting-bred brood mares with confident anticipations of brilliant results. If he were bred to thoroughbred, or even to half-bred brood mares, of pronounced trotting action, thereby, in the one case, obtaining a preponderance of thoroughbred blood, and, in the other, a double admixture of both running and trotting blood, the probabilities would preponderate that the progeny would return to both the formation, disposition and action controlled by the older lineage, which has become the more intense by reason of having so many more generations of inbreeding and peculiar training. The trotter is not yet one hundred years old. The runner antedates him as far as Place's White Turk does Treadwell's Abdallah. In the half-bred trotter, the disposition to return to the gallop of his thoroughbred ancestors, despite the restraint of harness and vehicle, is liable to precipitate him into breaks. Palo Alto, it will always be remembered, made many futile attempts to win the champion stallion record before he succeeded. His strong infusion of thorough-bred blood caused him to rush headlong to the half-mile pole with such uncontrollable speed that, mile after mile, he indulged in these disastrous breaks, which prevented him from wresting from Allerton the championship which, in any one of his trial miles, had it not been for his unsteadiness, he was able to compass. To further enforce this conclusion, the trials of Arion, his almost purely trotting-bred stable companion, is in point. He made three trials to reduce the champion two-year-old record. Every mile he trotted without a break. Every trial eclipsed his former effort, although he was urged to the limit of his trotting capacity. But he did not seem to know how to break from the trot to the gallop. In none of his wonderful trials did he show the least tendency to exhaustion. Indeed he rated his quarters with a capacity to hold his speed, and finished each mile with a resolution to succeed that has never been surpassed by any winner of the English Derby. No half-bred trotter, indeed no quarter-bred trotting horse has ever shown as much steadiness, coupled with the same speed, mile after mile, as has this most successful two-year-old trotter in turf history.

If the half-bred horse is thus unreliable on the turf, will his produce manifest the same flightiness?

This is another phase of the thoroughbred problem which Palo Alto is destined to solve. That he will produce trotting speed can not be questioned. That it will be uniform, is exceedingly questionable. Statistics show that pure trotting-bred sires produce the largest average of standard trotters; that three-quarter trotting-bred sires the next largest average; that half-bred the next largest; and that thoroughbred the least. Were it not for the extreme speed that is allied to thoroughbred infusion, this diminishing ratio of averages would solve the problem adverse to the use of thoroughbred blood.

The general reader may admit the success of three-quarter-bred trotting horses, like Alcyone and Alcantara, and Nutwood, who stands at the head of living sires, but he may question the trotting potency of half-bred sires. Taking the sires in the first letter of the alphabet in the Year Book of 1890, five are thus bred, American Clay and Almonarch each being the sire of three standard performers. But Edward Everett 81, is probably the most instructive instance in this connection. His dam is given as the daughter of imported Margrave. Mr. Wallace, the most

searching of skeptics of thoroughbred blood in the trotter has been unable to disprove this pedigree. For his generation Edward Everett was among the foremost of notable sires. He was not only the sire of extreme speed, as in the instance of Fullerton, and of several others whose records border on to 2:20, but of thirteen in the standard list, one of which, Eclipse 2:25, was three-quarters bred, being out of Dolly Varden by imported Eclipse. He has shown himself to have been quite a prepotent sire, for nine of his sons have produced twenty-eight standard trotters, and nine of his daughters are the dams of eleven performers. His two most successful sons are Hambrino and Hambletonian Tranby. The dam of Hambrino was Mambrina by Mambrino Chief, *second dam Susie by imported Margrave.* So that the dam of his dam as well as the dam of his sire was by the same thoroughbred imported Margrave. Yet he is the sire of the sensational Delmarch whose record of 2:11½ in a race has shown him worthy of favorable comparison with both Nelson and Allerton!

Hambletonian Tranby is a still stronger instance; for he is by Edward Everett out of thoroughbred Stratagem by Captain Beard, grandam by imp. Tranby. He was only fifteen years old when he died, yet he produced six standard trotters and four pacers, all making records of a low average. Governor Stanford, therefore, has sufficient precedent to warrant his breeding experiment, which he inaugurates upon a vantage ground superior to that which has ever been vouchsafed to any previous breeder in trotting history. Electioneer, the sire of Palo Alto, was a much better trotting-bred horse, and far more prepotent than Hambletonian the sire of Edward Everett. Dame Winnie, the dam of Palo Alto, was not only endowed with pronounced trotting action, but she has shown her capacity by producing three foals with trotting records ranging from 2:08¾ to 2:23½, while Dolly Varden the dam of Edward Everett never presented one to the standard list.

Palo Alto is infinitely superior to Edward Everett in formation, blood lines and speed. His harem will as far exceed, in the superlative riches of their varied trotting inheritances, that of Edward Everett, as he is himself the superior of that splendid sire; for the pedigrees of seven dams of his standard performers were not traced, nor traceable, while one was thoroughbred, and another was by Gridley's Roebuck, and only three were trotting bred, one being by Jupiter, one by Eureka, and one by Mambrino Chief. The example of Edward Everett bespeaks for Palo Alto extreme speed, but does it warrant great numbers as well as quality? Eleven sons by the same sire, Hambletonian 10, outrank Edward Everett as standard sires, and they are all out of trotting-bred dams. The majority of them are breeding on in the second generation much more prolifically than their sires. Senator Stanford has doubtless considered the force of these statistics against his favorite theory of breeding half-bred stallions for stock purposes. He may conclude that the conditions now existing at Palo Alto for so much greater success than that which awarded the services of Edward Everett, may bring up the numbers of performers sired by a half-bred horse to the average of pure trotting-bred sires. The alternative is tenable. He may be confident that the extreme speed which such a combination will develop will more than counterbalance the diminution in the numbers of standard performers. Such a result would not only increase, in the aggregate, the commercial value of the progeny, but add to the glory of his half-bred favorite Palo Alto, whose fame, as the champion trotting stallion, has compassed the ends of the earth.

The methods of Palo Alto in the use of thoroughbred mares will receive our consideration in the next paper.

FROM THE OLD SOD.

BY HENGIST.

"THE point of view" is always changing. It is generally with what is *next* that we now mostly concern ourselves. But a great deal of human interest lies cob-

Digitized by Google

webbed o'er, like good old wine, safe from sacriligious touch, till, opened up on special occasions, it is found to have enhanced its bouquet with accumulated years, then

"Former times shake hands with the latter,
And that which was before comes after."

So we have, to express ourselves in plainer language, been wandering over the record pages of the turf of yore—"the old sod," verily. Like every one who has done so, we have found much entertainment, feeling and hearing again the "touch of the vanished hand, and the voice that is still." It is a great world, the turf, and we shall present some views of it that may amuse the reader as they have the collector. "Doing as we would be done by," is it not pleasant to think that we may so help to establish more firmly a precedent for future generations, after we ourselves are dust, for making similar excursions into "the past" that will revive many an episode,' incident or saying of to-day that will soon be but a yesterday?

The chariot race described by Homer as taking place at the funereal games in honor of Patrolus is generally believed to have been the first racing that ever took place or was mentioned in history. Though this is not actually the fact, there having been one previous occurrence at which racing was "on the programme," it is certainly the better known of the two "events." It was the first time that we have any record of betting having been indulged in in connection with the horse. Idomeneus offered "the lesser" Ajax to lay a cauldron or a tripod on the field against the favorite. The bet was "booked," and Ajax had to pay, the favorite being, alas, nowhere.

Coming nearer home we find that during the reign of Henry II, *circa* 1170 A. D., Fitz Stephen, the monk, in his description of London, mentions trotting horses and running horses, relating with great animation the incidents that took place at the races, which were then held at Smoothfield, now known as Smithfield. This is supposed to have been the first mention of trotting in English literature.

In Britain, indeed, racing was "preeminently indigenous"—the "elastic turf and equable climate," it might be added "such oats, such horses and such men," to improve on Dr. Johnson—conducing thereto so effectually. Yet it is remarkable that there is scarcely an allusion to the "disport" by the immortal bard of Avon. This would show that it had not become so thoroughly national in the times of good Queen Bess, as it has in those of good Queen Victoria, when, according to a certainly stretched estimate of the enthusiastic "Druid," the doings of the turf interested four millions, a number, it has been shown, which must have included the total male population of the islands.

During Elizabeth's reign running horses were not yet kept exclusively for such purpose. Gentlemen matched their hackneys and rode the race themselves.

The most fashionable trial for the speed and goodness of their horses was hunting red-herrings, or "the train scent," from the body of some animal that had previously been drawn across hedge and ditch. Here the scent was certain and hot, and the hounds would run upon it to the end, with their utmost speed. The matched horses followed these hounds, and to be in with them was generally accounted a very satisfactory proof of goodness.

Markham and Michael Baret describe another mode of running matches across the country, denominated the wild-goose chase. "An imitation of the same continued in occasional use," says Lawrence (1809), "till the present time, under the name of steeple-chasing. Two horsemen, drunk or sober, in or out of their wits, fix upon a steeple, or some eminent distant object, to which they make a straight cut, over hedge, ditch and gate ('bee-line,' as we would curtly express it), the devil take the hindmost." The wild-goose chase was a more regular thing, and it was prescribed that after the horses had run twelve-score yards the foremost horse was to be followed, wherever he went, by the others, within a certain distance agreed upon, as twice or thrice his length, or be beaten or whipped up by the triers or judges. A horse so left behind a limited distance was deemed beaten and lost the match. Sometimes it happened that a horse lost the lead, which was gained and the chase

Digitized by Google

won by his stouter although less speedy antagonist. The lead was indeed frequently lost and won, "no doubt to the rapturous enjoyment of those who could relish such laborious and dangerous amusement," which was also frequently attended with disgusting cruelty, in the triers beating up the hindmost horses.

Those rude and barbarous modes of racing gave way in succeeding reigns to the more scientific, accurate and satisfactory trials of the horse carrying stated weights over the measured and even turf.

We must, however, here leave the early developments of the turf to deal with some incidents of later times. Some driver lately remarked that it was the horse that tried to win that was wanted, which remark was given much greater point when our editor added elsewhere that it was just such drivers too that were desired. The turf is full of stories of jockeys whose ambition seemed to be to try to win.

The great Sam Chifney, for instance, was a genius. He was the originator of "the waiting-race" idea. He was always the last until near the end of the race. Then he crept up to his rivals in a manner peculiar and stealthy, and "all his own." Once observing a young jockey (a son of the celebrated Clift) making very much too free with his horse to suit Sam, the latter addressed the lad thus: "Where are you going, boy? Stay with me and you'll be second." The anxious recruit drew back his horse, and a beautiful race ensued. But when it came to the final struggle it has not to be guessed who was the winner. "The Chifney rush" was as full of subtlety and genius as it was of irresistibility. As a sample of his skill it may be remembered that Eleanor, ridden by him, won the Derby and Oaks easily, while, ridden by an "outsider," she was beaten terribly by a common plater at Huntingdon.

It sometimes, however, would happen, even in the best regulated "waiting games," that the astute jockey counted without his host, so that in spite of all his exertions he would get inevitably left. On such occasion some calculating genius would, at the start, make a plunge for the prize, and get so far ahead that it was impossible for the surprised riders in the rear to make up the distance. Such a contingency had, therefore, to be, as Chifney apparently had, in the case related, watched for.

Chifney believed in one great principle, which has since been so successfully advocated as beneficial in prolonging human existence itself, viz., change. In a race, at critical moments, he would, imperceptibly to the horse, relieve the weight, distribute it or lighten it, by alterations in the positions of his seat in the saddle. He would alternate his seat in such a way that "that tired feeling" would scarcely be felt by the eager horse.

Chifney therefore was a rider who saved his horse all unnecessary exertion, to do which so few were competent. It may be imagined that during his career many a one "just lost the race" by a hairbreadth.

> Curs'd still to be near,
> But ne'er to reach the first,

which they never could understand. It likely made them think their horses were just as good as the winner; a pleasant result that Chifney's system, of saving the better horse, was responsible for. It did not accentuate the great difference between a great horse and a mediocre.

Chifney rode Escape for King George IV at Newmark in a sweepstakes against three other horses. Escape was the favorite in the betting, but he lost the race. Next day on the Beacon Course against five horses, when the betting was five to one against him, the horse again ridden by Chifney won. This resulted in an investigation by the Jockey Club and an ultimatum was sent to the royal owner "to quit"—the jockey or the course. To the credit of the King, be it ever said, he stood by his jockey. He soon, however, had his revenge; for though begged to return, he never gratified the repentant invitation.

King George was enthusiastically interested in the turf. On his deathbed he had the results at Ascot Heath made promptly known to him. He set an example not only to the best element in the society of his time, but to subsequent royal families and aristocracies. This interest has given that vitality of the turf

Digitized by Google

which it has so marvelously attained in Britain, where the veriest Quaker can talk learnedly (profitably) on horseflesh.

The "inexhaustible Edwardses" were continually a source of confusion. When George IV, seeing his own horses mixed with Lord Jersey's at Ascot, and being anxious to identify them and their riders, would ask "Who is that?" and repeatedly got the same reply—"Edwards!"—"Bless me," exclaimed he, "what lots of jockeys that woman breeds!" It must have been the same sovereign who originated the remark, "That must have been a great year for colts."

The duke of Cumberland, uncle to one of the royal Georges, was also warmly attached to the turf. He had a favorite colt, got by an Arabian. Being very solicitious about this colt, whilst in training, his highness often asked his groom concerning his improvement. This honest servant could never be tempted by the desire of pleasing his master to give a favorable account. "And please your royal highness," said the old man, "I don't like this colt's form of going, and I have no opinion of him." "Poh! Poh!" replied the duke, "what signifies talking at that rate. He must be thoroughbred you know, he is got by an Arabian." To this the unabashed man of years answered, with a smile: "What, then, and please your royal highness, they have no cart-horses in Arabia!"

Holcroft was another famous jockey, and, besides, was so accomplished as to be able to perpetuate himself, like Chifney, in a book—one of those books by "practicians" that bulge out with the great, good things learned of experience. His remarks as to the sort of a "leg" that is most successful on the turf has no reference to bookmaking. "Boys with straight legs, small calves, and knees that project but little, seldom become excellent riders. I, on the other hand, was rather bowlegged. I had then the custom of turning in my toes, and my knees were protuberant. I soon learned that the safe hold for sitting steady was to keep the knee and calf of the leg strongly pressed against the side of the animal that endeavors to unhorse you; and as little accidents afford frequent occasions to remind boys of this rule, it becomes so rooted in the memory of the intelligent that their danger is comparatively trifling." And he remarks that the best of stable boys are derived from what has become known as the "pigmy" breed.

John Day, the latest trainer in England to write a book, has produced "fac similes of himself cast in the right mould for the saddle," and riding about four stones—featherweights—less than half the weight of an average man. "Pigmies" for the "pigskin" must be an hereditary accomplishment.

From some remarks made in a recent paper on "American Riders" that appeared some months ago in *Harper's Magazine*, these riding hints may be useful to some of the jockeys of this country therein referred to. These American riders would seem to be "na muckle better than a draff-pock in the saddle," which was remarked by Moniplies, in the "Fortunes of Nigel," of some of his acquaintances. We are referring to the jockeys, not the gentlemen riders. The American jockey has not attracted the national brain as the American (sulky) driver has, seemingly.

The story of the brilliant career of poor Fred Archer, and its tragical termination was a sad commentary on the system which required training down to a requisite weight. The abstinence is sometimes intolerable. Instance the case of a jockey who had accomplished the necessary reduction. On the morning of the race, being afflicted with a thirst, he drank a cup of tea, and at once increased six pounds in weight. Scientists explained this by the fact of the rapid absorption of water by the vessels of the skin, the action of which was excited by the hot fluid taken into the stomach. The explanation came rather late in this case.

It is a strange comment on humanity that "that noble gift of Providence, the horse," has become such an evidence of depravity. It has been remarked that nothing remains honest but the horse himself, on that animal's coming into relations with human sporting ngenuity. The great and leading qualification of a horse bred for the turf, it has been well asserted, is the immaculate purity of his

Digitized by Google

blood. It would be a noble day if such could be the *sine qua non* of the bipeds that patronized the same in so far as their morals were concerned. "Every bookmaker is a leg, every backer of horses a Greek, every owner a gambler, every spectator a heathen of the deepest dye." If such is not a true synopsis of the turf to-day, it was "believed" to be so at one time. Then it was that "winners of races are not now in request." What was wanted was a good favorite. The favorite! "The race was not to the favorite, or even to the swift, but to the horse on whom the largest sum stood in certain persons' books," that is, to the horse "best" in the book. "Milking" was a phrase applied to working up a favorite and its results. Jockeys, many of them, were guilty of dabbling with private books. The consequence was that such riders, by mere nervous trepidation, were unfit to "engineer" the race, even for their own benefit, which might be to lose.

Yet among all this darkest turfdom there was no place where the proverb "A good name is as precious as ointment" was so treasured; or where the reality would be given so much for, if it could be put up to auction, and could carry with it, to the highest bidder, an outward recognition of its truth. "I would give £50,000 for a bit of character," said the old sinner Charteris, "for if I had that I think I could make a plum of it. Doing business on credit, however, always proved a bad policy.

Working backward, or deeper into this vein of depravity, we find that before "stealing races" was common, as a result of the establishment of the turf, that stealing the horse itself was quite a respectable profession. In Britain at one glorious period, it is recorded in certain chronicles that "horsethieving was a gentleman's business, but sheep stealing was only fit for hanging." However, in Yorkshire, where the horse was always such a prominent factor, we find that "punishment by death"—euphuistic allusion to hanging —was the reward of horse-stealing, up till a comparatively late period. It would seem that horse-stealing led to a dreadful reduction in the population; at any rate, since the abolition of the death penalty for the grave offense, so horsey had the county become that a great increase of population took place immediately after the abolition of capital punishment for doing a "gentleman's business."

There has been necessarily a "fringe of rascaldom and ruffianism hedging the turf," from which could be traced the villainy and roguery that was so intolerant when it was discovered. Yet that is destined to be kept more and more in check. "Bubbing another man's groom," "nobbling" and "drugging the favorite" are now, it may be said, unknown and unsung. On the other hand we find that the ardent love for racing, that is bred in the best of men, "has been concurrent with industrious, unselfish patriotism and healthy political views." The affairs of state and stud may be seen noted alternately in the same page of the diaries of Britain's greatest ministers. This is likely to be so still in the future.

Remedies for the abuses of the turf have been suggested in the restriction of the betting to the race-course, to transactions being made in ready money, and to the use of the Totalisator, which is legally enforced in Australia.

Our old friend, John Lawrence, declared that, "Stratagems are surely lawful in horse-racing as well as in love and war," and he gives an extended defense of his statement. But he is pronounced in the distinction between "pure" stratagems and deliberately planned "crookedness." His plea is stratagem against stratagem. He gives a good example of what he and most of us, too, would doubtless regard as a legitimate proceeding: "Merlin was matched for a considerable sum of money to run against a favorite horse of the noted (or notorious) Mr. Frampton, at Newmarket. Immediately on its being closed there was great betting between the north and south country gentlemen. After Merlin had been some little time at Newmarket, under the care of one Heseltine, Mr. Frampton's groom endeavored to bring him over to run the two horses a private trial, at the stated weights and distance agreed upon in the match, observing, by that means, they might both make their fortunes. Heseltine refused, but in such

Digitized by Google

a manner as to give the other hopes of bringing him over. In the meantime, Heseltine took the opportunity of communicating by letter, into Yorkshire, the proposed offer, to sir William Strickland, who was principally concerned in making the match. Sir William returned for answer that he might accept of it, and instructed Heseltine to be sure to deceive his competitor by letting Merlin carry seven pounds more weight than agreed upon, and at the same time laying a particular injunction to secrecy. Soon after Heseltine received this hint he consented to the proposal, but previous thereto Mr. Frampton had given his groom similar instructions. The two horses were prepared, started and ran over the course agreed to in the articles of the match, when Merlin beat his antagonist something more than a length of excellent running. This being communicated to each party by their secret and faithful grooms, who both rode the trial, flattered each with certain success. Merlin's friends observed that as he had beat the other with seven pounds more weight, he will win this race to a certainty. On the other hand, said Mr. Frampton to himself, as my horse ran Merlin so near, with seven pounds extra weight, he will win this race to a certainty. Immediately after, proposals were made on both sides to an enormous amount and accepted. It has been asserted that there was more money betted on this event than was ever known, gentlemen not only staking all the cash they were able to advance, but their other property also. At last the important hour arrived for the determination of this great event, and each party was flushed with the prospect of success. The south country gentlemen observed to those of the north that 'they would bet them gold while gold they had, and they might sell their land.' The horses started. The race was won by Merlin by about the same distance as in the secret trial. In a short time after, the plot became known, to the mortification of its inventor, Tregonwell Frampton, Esq." However wide of the fair the above might be allowed to be, it is difficult to blame the counter-plot of the north-country baronet. Tregonwell Frampton, who seems to have had rather an "unfortunate" reputation, was keeper of the royal studs of William III, Anne and George I and II. He died in 1727 at the age of eighty-six, "father of the turf." A reminiscence of him has lately occurred in the discovery, by Mr. J. B. Muir, author of "Raciana," of what is supposed to be the earliest extant portrait of a race-horse—Leeds. This horse was purchased by Queen Anne in 1705 from Mr. Holloway, for Prince George of Denmark. The portrait, in oil, is by J. Wooton, and introduces the portraits of Thomas Spedding and Mr. Frampton standing at the head of the horse. The picture is an interesting turf relic.

His grace the duke of Queensberry, another "father of the turf," was asked, on the Newmarket course, rather *mal apropos*, by a green jockey, loud enough to be heard by the bystanders: "How am I to ride this race, my lord duke?" The interesting question caused great mirth. But the duke was equal to the occasion, to use a hackneyed phrase. With a coolness and skill "peculiarly his own" (that was, apparently, a phrase much in vogue at the time), he parried the laugh by exclaiming: "How are you to ride? Why, take the lead, my boy, and keep it, to be sure, if you can; how the devil would you ride?" which reply was a lucky hit, it was remarked, for the duke, it seems, intended to make the play.

Lawrence relates the following: "Crazy Jack, or Tom Rider, a well known groom and jockey, rode a mare called Mad Hannah, the dam of Latham's Snap, and of Rattle, son of Snip, with panniers upon her, himself in the garb of a baker, all over powdered with flour, upon some country course, and demanded to have his mare entered at the post, which was agreed upon. He was an entire stranger, and as none but those in the secret knew from whence he came, the company was much amused with the jawing baker and his shabby-looking mare, for such was her appearance, fully expecting to see her lost by the race-horses. They were, however, much chagrined, as the baker's mare won the plate, and some money besides for the baker himself who rode her, habited as

he was in dusty-white, with an old hat."

As it is quite conventional for extremes to meet, here is another to keep the above company: "A chimney-sweeper in London kept a racer or two in training, and the fellow who rode for him was known by the name of Blackwig. This sportsman's mare was leading up and down the course at Epsom, some time before starting, when a gentleman interested in the race rode up to the person leading the mare, and the following laconic dialogue passed between them: 'What is the name of this mare?' 'Blackwing.' 'Who rides him?' 'Blackwig.' 'To whom does she belong?' 'Sootbag.' 'Umph! I hope she won't prove a black bargain for somebody.'"

The "ringer" seems to have been played in those days. In 1779 a number of people returned to London from Guildford with very long faces. They had lost their money in the following way: On the last day of the race, Old Slim, Old Damper, Miss Harvey, by Eclipse, and a horse of Hull's, met to run for the Town Plate. It seemed to have been settled that Damper was to win, and five to four was the betting upon him against the field. But a Newmarket horse entered in the name of Flush, no other than Humbug, by Chrisolite, a horse which had capital speed and which had won large sums at Newmarket. By an almost incredible inadventure, many regular bettors were actually ignorant that it was Humbug, against which they had laid their money at four to one; four sporting trials were never made of the race, and the horse, under the new name of Flush, humbugged a number of sportsmen out of their money. He verily proved a royal Flush for his exploiters.

There was in those days a horse named Copperbottom that became famous on account of the number of lawsuits there were over him. After Lord Mansfield had tried several courses to determine the ownership of the horse, and grown weary of such repeated litigation, the old judge, on being once more confronted with the mettlesome case, exclaimed from the bench, with that peculiar dryness of manner which was natural to him, and in a cadence equally peculiar: "What i' Godalmighty's name, gentlemen! will you never have done running this Copperbottom, ha?"

The judge may have come to the conclusion in this case that

> Witnesses, like watches, go
> Just as they're set—too fast or slow.

The "Lay of the Turf" would be a suggestive title for some literary expert. Here we do not refer to the odds, the topography, or the strategy. We have simply in mind a few measured courses of hoary rhyme. The following ingenious prescription, for the perfect composition of a jockey, will show that the idea of Gilbert in "Patience," as to that popular mystery a heavy dragoon, was by no means original:

> Take a pestle and mortar of moderate size,
> Into Queensbury's head put Bunbury's eyes;
> Cut Dick Vernon's throat, and save all the blood
> To answer your purpose, there's none half so good;
> Pound Clermont to dust, you'll find it expedient,
> The world can not furnish a better ingredient.
> From Derby and Bedford take plenty of spirit,
> Successful or not they have always that merit—
> Tommy Panton's address, John Waistill's advice,
> With a touch of Prometheus, 'tis done in a trice.

The following toast was a standing model for every such occasion:

> And when they came unto the ending post,
> Wicked Jimmy, he call'd for a bumper and toast,
> Here's a health to all sportsmen and to the grey mare,
> That lost all her cash on the Plains of Kildair.

The passion for "riding" has always been irresistible. Jimmy Hurst, "the Yorkshire eccentric," took his first lessons on a sow, and went hunting on his bull Jupiter. The passion for locomotion, other than on foot, was not confined to the sterner sex:

> Our maid she would a-hunting go;
> She'd never a horse to ride;
> She mounted on her master's boar,
> And spurred him on the side:
> Chink! Chink! Chink—the bridle went,
> As she rode on the Downs.
> So here we drink to our maiden's health,
> Drink 'round, brave boys, drink 'round.

The following is an adaptation from Bishop Hall after Juvenal, and contains some apt remarks:

> Go to the brutes, for here you'll think with me,
> Vain, without deeds, is pride of pedigree.
> Yon horse is noble, ask not how he's bred,
> Who wins the cup at Goodwood by a head:
> Who bears his heavy burden first of all,
> And bravely answers Archer's anxious call:
> Though beaten, quickens to his rider's hand,
> Amid the thunders of the roaring Stand.
> But if the jockey rouse, but rouse in vain,
> The quailing scion of a noble strain,
> The handsome coward has no charm for you,
> Though son of Stockwell, son of Caller Ou
> Without a sigh you bid the jade depart
> To penal servitude in cab or cart.

To bring these trial spurts to a finish, and to bring the view back to our own thoroughbred, the trotter, let us ask: If devotees of the running turf are called *turfites*, why might not the enthusiasts of the trotting track be called *sulkites*?

Digitized by Google

THE NEARNESS OF ANIMALS TO MAN.

THE late Professor von Prantl takes the ground that the lower animals are endowed with moral and intellectual faculties, but adds: "They are destitute of any logical apprehension and power of abstraction; for while they comprehend objects and their optical, acoustic and other efficient qualities in a certain abiding manner, they have no conception of substance or attribute, of coexistence or succession. Animals perceive also an actual casal connection, and are therefore capable of drawing causative conclusions, reasoning forward and backward, from cause to effect and from effect to cause, but not capable of a logical deduction; they seek a cause, but not a logical ground or reason, and are, by virtue of such endowment, wary and cautious, but without foresight" (*behutsam und vorsichtig, aber ohne Voraussicht*). In other words, "animals think without logic, but not therefore illogically."

Again, "in order to formulate precisely the distinction between man and beast," he sums up this difference in the succinct statement, "man has time-sense." Beasts have "space-sense," or the "sensual perception of expansive being," but not "time-sense; that is to say, the brain activity of man is competent to comprehend also pure succession as such, and the pure intensity of occurrence in general."

In proof of this proposition Prantl states that "man can count." Even without the use of names or numerals "he can fix the succession of days by marks, or express the number of objects lying before him gesticulatively with his fingers." This "sense of continuity, denied to the whole world of lower animals," renders man "conscious of being the same in a later as in a former time," and thus endows him with "immutable ego, consciousness, or Kant's transcendental apperception." It enables him to look before and after, to bind together the past and the future, and thus to create law and order, domestic, social, and political institutions, ethics, art, religion, science, and history, and to make external things serve his purposes and supply his wants. "Man, and man only, fabricates weapons and tools, kindles fire, plants seeds in the earth, and is alone capable of self-renunciation and suicide." "By virtue of this continuity of his self-consciousness and his look into the future, he transforms the realities around him and makes them minister to his ideals." The sole and ultimate source of all these higher developments and ideal acquisitions of humanity, individual, social, political, industrial, and artistic, is to be sought in "the far-reaching and fundamental postulate that man is endowed with time-sense."

For this reason man alone is able to distinguish between the subjective and the objective, to conceive of the subject as an object, and to apprehend mathematical truths and relations, which are purely ideal, as real. "It would be ridiculous to ascribe mathematics to animals; nevertheless the labors of the bee and of the spider excite astonishment; but inasmuch as, with genuinely animal limitations, they always appear in a definite geometrical form, they show that they are not products of spontaneous mathematical thinking."

Prantl also denies that expressions of sorrow, remorse, or gratitude on the part of animals furnish any evidence that they act under the impulse of moral ideas, but interprets them as having reference to their own well-being or comfort. To talk of the "art-instinct of animals" is, he thinks, a mere confusion of terms, "since we demand of art that it shall realize an idea." Still, after all his metaphysical distinctions, he admits that the essential nature of man as distinguished from that of the beast is "only the result of a progressive upward evolution." If this conclusion be correct, and it is all that the most advanced zoöpsychologist has ever claimed, then the distances (*Abstande*) between man and beast are not impassable, and even "human speech" (*die menschlische Sprache*) is but a higher development of "animal utterance" (*die thierische Kundgebung*).

The weak point of these speculations concerning the mental powers of animals is that they are too exclusively metaphysical, constituting a logical and systematic exposition of conceptions or notions without that accurate and exhaustive ob-

servation of facts which no acuteness of analysis and no vigorous process of pure thinking can supply. Not only is Prantl ignorant of the habits and aptitudes of animals, denying them capacities which they are known to possess, but he is liable to an opposite error, equally fatal to his theories, in his tendency to ascribe to the human race as a whole faculties which are characteristic of man only in a high state of civilization. He ignores the savage and the boor, and compares beasts with the most cultivated and most highly developed human beings, overlooking the long period which man existed on the earth before he even learned how to chip flints.

As to the "ideal-sense," upon which Prantl lays peculiar stress, there are low tribes in which it is wholly wanting, and which are as destitute of historical annals as any herd of apes. How much knowledge of the past may be transmitted from generation to generation by tradition in a community of monkeys it is impossible to determine. The amount of information thus preserved and accumulated in simian hordes is probably very small and exceedingly vague, since even human hordes not native to the countries they inhabit soon lose all recollection of the early migrations of their ancestors, and all traditions concerning the cradle of their race. This is why savages always regard themselves as autochthones, even in cases in which it can be clearly proved that they are not aboriginal to the soil, and that their immigration is of comparatively recent date.

There is no reason to believe that "time-sense," which Prantl claims to be the exclusive attribute of man, and from which he derives the superior mental evolution and equipment of the human race, is wholly lacking in the lower animals. Every creature endowed with personal consciousness and memory must know that it is the same being to-day that it was yesterday, or, in other words, that it exists in time. The possession of this knowledge does not imply the possibility of indulging in philosophical reflections about it any more than the possesion of thoughts necessarily involves the power of thinking about thoughts, although it would be rash to affirm that animals may not be capable of giving themselves up to meditation by recalling mental impressions and making them objects of thought.

Time-sense is very highly developed in domestic fowls and many wild birds, as well as in dogs, horses and other mammals, which keep an accurate account of days of the week and hours of the day, and have, at least, a limited idea of numerical succession and logical sequence. A Polish artist, residing in Rome, had an exceedingly intelligent and faithful terrier, which, as he was obliged to go on a journey, he left with a friend, to whom the dog was strongly attached. Day and night the terrier went to the station to meet every train, carefully observing and remembering the time of their arrival, and never missing one. Meanwhile he became so depressed that he refused to eat, and would have died of starvation, if the friend had not telegraphed to his master to return at once if he wished to find the animal alive. Here we have a striking exhibition of time-sense as well as an example of all-absorbing affection and self-renunciation likely to result in suicide.

Love, gratitude, devotion, the sense of duty, and the spirit of self-sacrifice are proverbially strong in dogs, and only a "hard-shell" metaphysician, who neither knows nor cares anything about them, would venture to deny them all moral qualities, and to assert that they are governed solely by a regard for their own individual well-being. There are also many apparently well-authenticated instances of animals deliberately taking their own lives; and without too credulously accepting anecdotes of this sort, in which it is difficult to determine whether the creature was a *felo-de-se* or the victim of an accident, there is no psychological reason for rejecting them as old-wives' fables.

According to Spinoza, benevolence in animals consists in the exercise of friendly feelings toward their kind, and this is all that we have a right to demand of them. A good cat, for example, is a cat that is good to her kittens, however cruel she may be to birds and mice. Indeed, her goodness, from a feline as well as from a human point of

Digitized by Google

view, is in direct proportion to her destructiveness of the smaller rodents. A like standard of virtue prevails among low races of men, and constitutes the highest ideal of tribal ethics. The best man among barbarians is the one who is most terrible to their foes, and can put the greatest number of them to death in the shortest time. Such manifestations of love of kin and love of country are only enlargements of self-love; and it is a long way from this primitive form of egotism to universal philanthropy, and to the still broader benevolence which Buddhism inculcates toward all sentient creatures. One is inclined to pardon the gruff cynicism of Dr. Johnson in denouncing patriotism as "the last refuge of scoundrels," when one sees how much individual selfishness finds a covert under this fine-sounding word, and what fierceness of interdynastic and international strife it is made to provoke and to palliate.

Not only the social instincts, but also the moral sentiments growing out of social relations, are common to man and to beast. It is evident that germs of moral ideas and perceptions of moral obligations enter into the conjugal unions of beasts, and impart a certain stability and sacredness to these ties. Many animals are strict monogamists, and have thus attained what Aryan civilization now generally accepts as the highest and purest form of sexual affection and association. With beasts, too, as with men, it is the male which scruples least at transgressing the monogamous principle, and makes light of this breach of fidelity, treating it as a pardonable peccadillo.

The mandarin duck is proverbial for conjugal faithfulness, and the Chinese are accustomed to carry a pair of these fowls in bridal processions, as an emblem of connubial love and an example of constancy for the newly wedded couple. Canaries are also characterized by the same virtue, and the attempt to force them into bigamy by keeping one male and two females in the same cage is uniformly destructive of domestic bliss, and frequently fatal to the young. Jealousies are quite sure to arise in consequence of a preference of the male for one of his mates; and the consort that feels aggrieved by marital neglect will take every opportunity to avenge herself by pecking and pestering her favored rival, and destroying her nest with its contents of eggs or callow brood. Even the young which are reared under such circumstances are far inferior in beauty and vigor, as well as in numbers, to the offspring of a peaceful monogamous canary household.

Whether the family may be the originary nucleus of the tribe, or, as is more probable, may have been developed through a process of differentiation out of a primitive community, whose members lived in sexual promiscuity, the impulse to herd, as well as the purposes it subserves, are the same in savages and in beasts. Wolves hunt in packs, cattle, horses, and sheep unite for mutual protection, and this tendency remains even after their domestication, when it is no longer essential to their safety, and becomes, as in man a purely social feeling. Birds of passage assemble for their annual or semi-annual migrations, and separate into families as soon as they have reached their destination; still preserving, however, their larger and laxer social organization as "birds of a feather," which enables them to "flock together" again with facility, whenever the general interest requires united action of any kind. This sense of community is especially strong in rooks and storks, which seem to have a regular system of government, by means of which they enforce discipline, reproving and correcting deviations from their common standard of rectitude, and even inflicting capital punishment for certain transgressions. In such cases the family ceases to exercise jurisdiction over its own members, and recognizes the superior penal authority of the commonwealth.

The instances recorded of animals holding courts of justice and laying penalties upon offenders are too numerous and well authenticated to admit of any doubt. This kind of criminal procedure has been observed particularly among rooks, ravens, storks, flamingoes, martins, sparrows, and occasionally among some gregarious quadrupeds. It is as clearly established as human testimony can establish anything that these creat-

Digitized by Google

ures have a lively sense of what is lawful or allowable in the conduct of the individual so far as it may affect the character of the flock or herd, and are quick to resent and punish any act of a single member that may disgrace or injure the community to which he belongs.

Sometimes an irascible husband may take the law into his own hands, and summarily avenge himself on a faithless wife and her guilty paramour without bringing the case before a general assembly of his kind. Usually however, it is the whole body which, after due deliberation, pronounces and executes judgment and maintains the majesty of the law. The penalty does not always involve the forfeiture of life, but varies in rigor according to the turpitude of the offense; the culprit being often condemned to a severe castigation, after which he resumes his position in society a sadder and wiser member of it.

Dr. Edmonson states that the hooded crows in the Shetland Islands hold regular assizes at stated periods, and usually in the same place. When there is a full docket, a week or more is spent in trying the cases; at other times, a single day suffices for the judicial proceedings. The capitally condemned are killed on the spot.

The owner of a house near Berlin found a single egg in the nest of a pair of storks built on the chimney, and substituted for it a goose's egg, which in due time was hatched, and produced a gosling instead of the expected storkling. The male bird was thrown into the greatest excitement by this event, and finally flew away. The female, however, remained on the nest, and continued to care for the changeling as though it were her own offspring. On the morning of the fourth day the male reappeared accompanied by nearly five hundred storks, which held a mass-meeting in an adjacent field. The assembly, we are informed, was addressed by several speakers, each orator posting himself on the same spot before beginning his harangue. These deliberations and discussions occupied nearly the entire forenoon, when suddenly the meeting broke up, and all the storks pounced upon the unfortunate female and her supposititious young one, killed them both, and after destroying the polluted nest, took wing and departed, and were never seen there again.

It happens, occasionally, that the confidence of the male stork in the virtue of his spouse is too strong to be shaken even by the presence of such questionable progeny; or, if he suspects her of frailty, he deems it best to condone the fault. They then unite in exterminating the bastard brood, and prudently keep the mysterious episode of ciconian domestic life to themselves.

Prof. Carl Vogt tells the story of a pair of storks which had lived together for many years in a village near Soletta. One day, while the male was absent, providing for his family, a younger suitor appeared, and began to pay court to the wife. She received his addresses at first with indifference, but as the woman who hesitates is lost, so she finally fell into the snares of her passionate and persistent adorer. His visits became more frequent, and at last he succeeded in so completely fascinating the matron that she was persuaded to accompany him to a marshy meadow, where her unsuspecting husband was engaged in catching frogs, and to join her gay paramour in putting the old stork to death.

A similar case occurred recently in north Germany. A pair of storks had had their nest on the roof of a barn for several seasons, without any apparent discord in their domestic relations. Suddenly, early in the spring, a powerful male stork made his appearance, and violently attacked the husband, who bravely defended himself, his spouse, strangely enough, taking no part in the fray. The assailant withdrew toward evening, his feathers dappled with blood, but renewed the attack on the following morning. The proprietor of the estate on which the scene took place resolved to interfere and shoot the intruder, but unfortunately aimed at the wrong bird, and killed the husband. After this mishap, the female remained quietly perched on the roof by the side of the stranger, with whom she soon began to chatter in a very lively manner. The talk continued for about an hour, when both storks, as with one accord, fell upon the nest, threw out the

eggs, tore it in pieces, and, after gazing for a moment on the ruins, rose together into the air, and, mounting in ever higher circles, vanished from view. Here the wife was at least accessory to the crime after its commission, and her conduct during the combat would seem to indicate that the strange stork was her accepted lover. and his coming preconcerted. Such occurrences, however, are exceptional. As a rule, storks are distinguished for conjugal fidelity no less than for their superior intelligence and the strong ties of affection which they form for human beings.

Ravens also have been known to destroy a nest in which a young owl had been discovered, and to kill both the birds whose home had thus suffered contamination, being evidently determined that the ancient and honorable race of *Corvus corax* should not be corrupted; and cocks, in several cases, are said to have killed hens which had hatched the eggs of ducks or partridges. One would hardly suspect such susceptibilities in a polygamous fowl, and least of all in our sultan of the barnyard, who guards his harem with the fierce jealousy of a Turk, but bears his paternal responsibilities very lightly, leaving the brooding mothers and their young for the most part to shift for themselves.

The impulses and motives which lead to the commission of crime are essentially the same in beasts and in man, and students of penal jurisprudence are just beginning to learn that the psychology of criminality in civilized society can never be fully understood except by a careful scientific study of it not only in savages, but also in the lower animals. The incentives to deeds of violence are pretty much the same in both. Many actions, such as the killing of deformed or sickly infants and of old and infirm individuals, are common to barbarians and to beasts, and are regarded as right because they contribute to the collective strength and consequent safety of the tribe or herd; but with the civilization of man and the domestication of the brute this precaution is no longer needed, and the primitive practice is abandoned. Mice take excellent care of their aged, blind, or otherwise helpless kin, concealing them in safe places and providing them with food. It must be remembered, however, that the mouse has lived in a semi-domestic state as the companion of man from time immemorial.

In the development and organization of social and civic life the bee and the ant hold the foremost place among articulates, corresponding to that of man among vertebrates. They stand respectively at the head of their class, and represent the highest point attained by insect and mammal in the process of evolution. As regards form of government, it is a mistake to speak of the bee state as a monarchy; it is, on the contrary, the most radical of republics, or rather a democracy of the most rigorous kind, with absolute power vested in the working class. The claims of "labor" to the exercise of supreme control in political affairs are here fully recognized and practically realized. The so-called queen is really the mother of the hive; her functions are maternal rather than regal. If she may be said to reign in a certain sense, the workers rule, deciding all questions and performing all acts affecting the common weal. The existence of but a single queen leaves no room for those dynastic enmities and rivalries which have so often disturbed the peace of human empires, and inflicted such untold misery upon mankind. If perchance two queens are produced at the same time, instead of forming factions in the state and exciting civil war, they contend personally for sovereignty, until one of them is killed. Sometimes the workers intervene, and put the less desirable of the claimants to death; or if the hive is populous and circumstances are favorable, a portion of the inmates swarm and carry off one of the contestants to found a new colony. In all these operations the queen initiates nothing; she is a passive instrument in the hands of the workers, whose decisions she accepts, but does not influence in the slightest degree. There is no "blue blood" in her veins except such as may be produced by a process of pampering; she is simply a worker, taken in a larval state and fattened into regal favor and function by what Huber calls "royal treatment;" that is, by relieving her from all toil and supplying

Digitized by Google

her with richer nutriment. If on account of bad weather or for any other reason, the bees do not wish to swarm, they do not hesitate to throw all superfluous members of the royal family out of the hive. The institution of appanage is unknown to apian communities. But, in order to provide for emergencies, several larvæ are reared in a single cell, which the old queen is never permitted to approach, since she is as jealous of these royal scions as was ever Persian padishah of his next of kin. For this reason they are kept in close confinement until they are needed.

Doubtless the queen has certain constitutional rights, but they are very limited. She is in the condition of Queen Victoria with Mr. Gladstone as prime minister: she is not asked what ought to be done, but is simply told what the cabinet intends to do, and is expected to indorse it, whether agreeable to her feelings or not. But this relation does not prevent a strong sentiment of loyalty toward her on the part of the workers, who are ready to defend her at the risk of their own lives.

On the other hand, they do not show the slightest affection for the males, or drones, who are in the unenviable position of prince consorts, or mere propagators of the race. No provision is made for them when the winter supplies of food are laid in; they fulfill their mission in summer, flying abroad on wedding tours with the queens of various hives and enjoying their honeymoon; but with the early frosts they are thrust out of the hives, and perish of hunger and cold. Meanwhile the queens preserve the sperm in a sac, and use it at pleasure for fecundating the eggs; as the fecundated eggs produce females and the unfecundated males, the numerical relation of the sexes can be easily regulated. The workers, or neuters, are really females, whose sexual organs remain rudimentary because all their energies are absorbed in labor. The ovary is only partially formed, and they are incapable of laying eggs; but it needs only a course of "royal treatment," consisting of luxury and idleness, to develop any of the larvæ into queens. The queen has no heirs, either apparent or presumptive, and no right of succession is recognized. Any larviform worker can be metamorphosed into a queen, as every American schoolboy is a possible president of the United States.

That this perfect social and industrial organization, in which the principle of the division of labor is so admirably applied and a career opened to every talent, is the result of gradual growth and evolution is evident from the more primitive habits of other hymenoptera, such as wasps, hornets and bumblebees. Tame honey bees also differ greatly in this respect from wild ones, and are known to have changed their manner of life and to have improved their methods of work to a considerable extent within the memory of man. They have ceased to make comb since the apiarist has begun to furnish them with a good manufactured article, and devote all their activity to filling the cells, an arrangement apparently satisfactory to both parties. It is probable, too, that bees, after having been supplied with artificial comb for several generations, would finally forget how to make it, and perhaps be no longer able to secrete the wax.

Populous and powerful bee communities sometimes relapse into barbarism, renounce the life of peaceful industry for which they have become proverbial, acquire predatory habits, and roam about the country as freebooters, plundering the smaller and weaker hives, and subsisting on the spoils. These brigand bees seldom reform; if they busily "improve each shining hour," it is not to "gather honey all the day from every opening flower," but to range the fields in looting parties, and ransack the homes of honest honey-makers. Against these anarchists of apian society and other foes the honey bees often fortify their hives, barricading the entrance by a thick wall, with bastions, casemates, and deep, narrow gateways. When there seems to be no immediate danger of hostile attack, these defensive works, which seriously interfere with the ordinary industrial life of the hive, are removed, and not rebuilt until there is fresh occasion for alarm. The common bee (*Apis mellifica*) not only rifles the nest of the bumblebee (*Bombus*), but numbers of them often

Digitized by Google

surround one of the latter and force him to give up the sacs of honey he has gathered. The clumsy and not very courageous bumblebee submits to the demands of these highwaymen, surrenders his treasure without much ado, and then flies afield in search of more.

It is undeniable that, in the life of the honey bee, a sort of historical connection exists between the mother hive and her colonies. This sense of kinship extends to the colonies of colonies, and thus gives rise to something like international relations between a large number of apian communities, which share the friendships and the hatreds of the original stock and transmit them to their posterity. Lenz relates his own experience on this point. Six of his hives were blown down by the wind; he hastened to set them up again, but the bees, rushing out and seeing him thus engaged, regarded him as the cause of the disaster, and stung him. For years afterward they pursued him whenever he approached their hives, and this unjust antipathy was inherited by all the swarms which issued from these hives and founded colonies elsewhere.

Here we have a striking instance of hereditary enmity, such as often characterizes families, tribes and clans, and takes the form of the vendetta. The bees that had suffered the supposed wrong never forgot it, and communicated their feelings to their descendants by way of tradition.

Prantl's assertion that animals do not plant seeds in the earth and raise crops is merely one of many *a priori* deductions from his assumption that they lack time-sense, and therefore can have no appreciation of the succession of seasons. All facts opposed to this inference he would treat with a skeptical shrug of the shoulders, or relegate with an incredulous smile to the realm of fable. Nevertheless it is only by the careful observation and critical sifting of facts that such questions can be decided.

It has now been ascertained beyond a doubt that in Texas and South America, as well as in southern Europe, India, and Africa, there are ants which not only have a military organization and wage systematic warfare, but also keep slaves and carry on agricultural pursuits. Nineteen species of ants with these habits have been already discovered, and their modes of life more or less fully described.

Nearly half a century ago Dr. Linsecom began his studies of the Texan agricultural ant (*Atta malefaciens*), and after devoting some fourteen years to this subject communicated the results of his researches to Mr. Darwin, who embodied them in a paper read before the Linnean Society of London, April 18, 1861. This ant, he informs us, "dwells in what may be termed paved cities, and, like a thrifty, diligent provident farmer, makes suitable and timely arrangements for the changing seasons. . . . It bores a hole, around which it raises the surface three and sometimes six inches, forming a low circular mound having a very gentle inclination from the center to the outer border, which, on an average, is three or four feet from the entrance. On low, flat, wet land, liable to inundation, though the ground may be perfectly dry at the time when the ant sets to work, it nevertheless elevates the mound in the form of a pretty sharp cone to the height of fifteen to twenty inches or more, and makes the entrance near the summit. Around this mound, in either case, the ant clears the ground of all obstructions, and levels and smooths the surface to the distance of three or four feet from the gate of the city, giving it the appearance of a handsome pavement, as it really is. Within this paved area not a blade of anything is allowed to grow, except a single species of grain-bearing grass. Having planted this crop in a circle around, and two or three feet from the center of, the mound, the insect tends and cultivates it with constant care; cutting away all other grasses and weeds that may spring up amongst it, and all around outside the farm circle to the extent of one or two feet or more. The cultivated grass grows luxuriantly, and produces a heavy crop of small, white, flinty seeds, which under the microscope very closely resemble ordinary rice. When ripe, it is carefully harvested, and carried by the workers, chaff and all, into the granary cells, where it is divested of the chaff and packed away. The chaff is taken out and thrown beyond the limits of the paved area. During protracted wet

Digitized by Google

weather, it sometimes happens that the provision stores become damp, and are liable to sprout and spoil. In this case, on the first fine day, the ants bring out the damp and damaged grain, and expose it to the sun till it is dry, when they carry back and pack away all the sound seeds, leaving those that had sprouted to waste. They also check the tendency of the seeds to germinate by biting off the incipient sprouts, treating them as a farmer does his potatoes or onions under similar circumstances.

In pasture-lands, the grass cultivated by the ants is liable to be cropped by cattle, and thus prevented from bearing seeds and producing a harvest. In order to avert such a disaster, the ants avoid the meadows, which are given up to grazing, and establish themselves in the fence corners of cultivated fields, along garden walks or near gateways, or in other protected places, where their crops run the least risk of being destroyed.

These observations, the truth of which is amply confirmed by other writers, as, for example, by Dr. Henry C. McCook in The Agricultural Ants of Texas, are a complete refutation of Prantl's zoöpsychology; for no husbandman ever showed greater skill in adapting himself to circumstances, or manifested a higher degree of intelligence and foresight in conducting his agricultural operations, and in consulting for this purpose the nature of the soil and the variety of the seasons, than are exhibited by these marvelous insects.

Indeed, nearly all the institutions and gradations of culture and civilization which the human race has passed through, and of which we find survivals among the different tribes of men, exist also among ants. Besides the tillers of the soil just mentioned, there are other species, like the Peruvian cazadores, which still lead a nomadic life, having no permanent homes, but wandering from place to place; entering the houses of the natives by millions; killing rats, mice, snakes, and all sorts of vermin; devouring offal; and performing in general the useful functions of itinerant scavengers. On the approach of these hordes the inhabitants quit their dwellings, and do not return until the invading host has passed on. Dr. Hans Meyer, in an account of his ascent of the Kilima-Njaro, in equatorial Africa, states that his camp was one night attacked by an army of driver-ants, and had to be abandoned. He describes the army as divided into three distinct classes, or castes—superior officers, under officers, and the rank and file, each of which is provided with mandibles of different size and efficiency as weapons, and corresponding with the duties they have to perform. Other ants have advanced beyond this nomadic life of pillage, and have acquired fixed habitations; they do do not cultivate the soil, but keep herds of aphides, or plant-lice which yield them a milky substance, and are also slaughtered for food.

The slaveholding ants are of several kinds, and differ greatly in the manner in which they treat their vassals. Some make them do all the work under the direction of overseers; others share their labors; while still others have fallen into such habits of luxury as to be unable or unwilling to wait upon or even to feed themselves, and are carried about and provided with food by their body-servants. In many cases this sybaritism is the mere ostentatious love of being served. The incapacity is not physical, but moral; and arises from an aristocratic aversion to any kind of menial labor, from the pleasure of being served by a train of obsequious attendants, and the notion that it is more dignified and distinguished to be borne along and to have food put into their mouths than to walk on their own legs and help themselves to victuals; since these apparently so helpless ants are agile and energetic enough as warriors, when it is a question of conquering and plundering their peaceful neighbors. It is the false sense of honor, fostered by the military spirit which takes pride in brandishing a sword and, on the slightest provocation, plunging it into the vitals of a fellow-man, but would deem it a deep disgrace for an officer to brush his own clothes or black his own boots.

Sometimes, in consequence of severe exactions, the slaves rise in revolt, and are mercilessly put to death; and formican like old Roman law seems to recog-

Digitized by Google
471431 A

nize the right of the master to inflict summary capital punishment in such cases. This power is often exercised by the red-bearded ant (*Formica rubibarbis*), who is a fierce slaveholder, and as pitiless in suppressing mutiny as was Barbarossa after the siege of Milan.

Ants differ in quickness of apprehension and in ingenuity quite as much as men do. Some with which Sir John Lubbock experimented, when cut off from their supply of food by the removal of a little strip of paper which had served as a bridge over a chasm a third of an inch in breadth did not know enough to replace it. In similar cases, ants have been observed bringing straws from a distance for the express purpose of bridging chasms that separated them from a desirable article of food. Bridges for this purpose are often an inch long, and made of mortar or cement consisting of a mixture of fine sand with a salivary secretion.

In a monastery near Botzen, in the Tyrol, one of the monks put some pounded sugar, together with a few ants taken from an ant-hill in the garden, into an old inkstand, which he suspended by a string from the cross-piece of his window. Very soon the ants began to carry the sugar along the string to their home in the garden, and returned with many others that went to work in the same way. After two days, although the greater part of the sugar was still in the inkstand, no ants were seen on the string; and, on closer examination, it was found that about a dozen of them were in the inkstand, busily engaged in throwing the sugar down upon the window-sill below, where others were carrying it off to the hill. They thus saved themselves the trouble of climbing the whole length of the window and down the string into the inkstand and back again with their burdens, and avoided by this means an immense expenditure of strength and loss of time. This change in the plan of operations shows remarkable powers of observation and reflection, and was doubtless suggested by some of the more thoughtful and practical members of the community, and, after being communicated to the others, was adopted by them.

As regards moral attributes, says Dr. McCook in his work on the honey ants: "I am much inclined to the view that anything like individual benevolence, as distinguished from tribal or communal benevolence, does not exist. The apparent special cases of beneficence, outside the instinctive actions which lie within the lines of formicary routine, are so rare and so doubtful as to their cause that, however loath, I must decide against anything like a benevolent character on the part of my honey ants."

It is often quite impossible to determine whether human actions arise from public spirit or private feeling; and an attempt to fathom the motives of ants, and to decide whether they are animated by a love of their kind and a desire to promote the general weal, or by a special good will toward individuals and what we call personal kindness, is attended with equal difficulty. But what the author affirms of honey ants is also true of savages, whose benevolence is tribal rather than personal; even civilized man, with rare exceptions, moves in the same narrow traditional rut, and is swayed in all his sentiments by national prejudices and prepossessions. The feeling of kinship is nevertheless especially strong in ants and is not weakened by long absence. Mr. Darwin shut several of them in a bottle with asafœtida, and then released them and brought them back to their colony. At first their fellow-ants threatened to attack them and thrust them out, but soon recognized them under their offensive disguise, and received them with evident marks of affection. Still, no one would be justified in asserting that the elements of individual love and personal preference do not also enter into these relations. There is no doubt that strong attachments are formed between animals, and that they are capable of emotions of pity and acts of generosity, not only toward their own kind, but even toward creatures of another species. A gentleman who had a great number of doves used to feed them near the barn; at such times not only chickens and sparrows, but also rats, were accustomed to come and share the meal. One day he saw a large rat fill its cheeks with kernels of corn and

Digitized by Google

run to the coach-house, repeating this performance several times. On going thither he found a lame dove eating the corn which the rat had brought. Such an action on the part of human beings would be looked upon as a charitable desire to relieve the necessities of a helpless cripple, and every one would be satisfied with this simple explanation; but as a rat is assumed to be incapable of similar feelings, its conduct is regarded as the resultant of a series of impulses of sensation, perception, and conception, under which the animal is led to do wonderful things in an automatic way, without any conciousness of the purpose for which it does them; and thus a moral virtue is obscured and wholly hidden from view by a mass of metaphysical jargon.

Again, the ability to use tools and to wield weapons, which Prantl derives from the possession of time-sense, is not exclusively human. Ants build bridges with splinters of wood, small pebbles, grains of sand, and other available materials, and tunnel small streams, and their skill in performing such feats of engineering and in meeting any emergencies that may arise is almost incredible; but the testimony of Bates and Bär and other naturalists leaves no doubt as to the reality of these achievements. They also make a clever and effective use of implements in capturing and killing the ferocious sand-hornet, which they seize by the legs and fasten to the ground by means of sticks and stones and then devour at their leisure. Here we have an unmistakable instance of the use of instruments for the accomplishment of a particular purpose. The same is true of the ant-lion when it prepares a pitfall and lies in wait for its prey, just as any hunter would do.

Mr. Romanes seems to think that the only tool-using vertebrates are apes and elephants, but such a restriction is hardly justified by facts. The following incident, which is vouched for by Mr. William B. Smith, on whose farm at Mount Lookout it occurred, proves that an ass may understand the worth of weapons, and be able to avail himself of them. A donkey, which was in the same pasture with an Alderney bull, was frequently attacked by the latter and worsted in the combat. Convinced that his heels were no match for his adversary's horns, the ass took a pole between his teeth, and, whirling it about, whacked his assailant so vigorously over the head that the latter was finally glad to give up the contest, and lived thenceforth on a peaceful footing with his long-eared and long-headed companion.

Cats and dogs open doors by pressing the latch-key, or cause them to be opened by pulling the bell-cord or lifting the knocker; and every farmer knows, to his frequent vexation, how readily cows familiarize themselves with the mechanism of gates.

Crows, cormorants, gulls, and other birds carry shellfish into the air and drop them on rocks, in order to break their hard covering and to eat the flesh. If the first fall is not sufficient, they carry it up still higher, and thus virtually hit it a harder blow. If a boy cracks a nut by hurling it against a stone, he makes use of the stone as a tool as truly as if he should take a stone in his hand and strike the nut with it. The former process is that employed by the birds, which are in this respect tool-using animals. There are rocks on the seacoast which have served generations of birds as stationary hammers for smashing mollusks, and are evidently regarded by them as a permanent slaughter-house.

It is well known that monkeys living near the seashore where the ebb tide leaves the rocks covered with oysters, evince extraordinary expertness in opening these bivalves with sharp stones, just as a man would do under like circumstances. It would require only a very slight increase of intelligence for a monkey to learn to break a stone into proper shape, instead of selecting a suitable one from the shingle of the beach, and, by thus fabricating a tool, bring himself abreast, intellectually, with the flint-chipping man of the early stone age. Indeed, it has been suggested by some scientists that man had not yet appeared upon the earth in the miocene age, and that the chipped flints of that period are the work of semi-human pithecoid apes of superior intelligence; and there is nothing in the theory of evolution or

Digitized by Google

the facts of natural history that would render such a supposition absurd. Monkeys use stones as hammers and sticks as levers, and appreciate the advantage to be derived from this the simplest of the mechanical powers. With them, as with primitive or uneducated men, this knowledge is purely empirical, a product of experience, and does not imply a perception of mathematical truths or principles any more than the taking of a short cut diagonally across a field involves a knowledge of the relation of the hypothenuse to the other two sides of a right-angled triangle. In neither case is there any question of what Prantl calls "spontaneous mathematical thinking."

Simian dexterity is greatly increased by association with human beings and by observation of their doings. The owner of a pet monkey, which annoyed him by ringing the servants' bell, tied several knots in the cord, in order to make it shorter and place it out of the animal's reach. But the crafty creature was not to be thwarted by such a clumsy device, and, climbing up on a chair, artfully untied all the knots, and then gave the bell a succession of violent jerks to signalize his triumph.

Prantl also characterizes man as the only animal familiar with the use of fire, and capable of applying it to culinary and economical purposes and to the increase of personal comfort. But this attainment is by no means common to all mankind. *Homo sapiens* inhabited the earth for ages before he discovered methods of generating this element and making it subservient to his interests. The habitual use of fire is the sign of a very considerable advancement toward civilization, and marks an important epoch in the evolution of the race. Chimpanzees, gorillas, and orang-outangs have been repeatedly seen bringing brushwood and throwing it on the camp-fires which travelers have left burning; showing that they have learned by observation how to keep up a fire, although they have no means and do not understand the art of kindling it. By associating with man they soon acquire this knowledge, igniting friction matches, and often have to be watched carefully, like children, lest they should do immense mischief unwittingly as incendiaries. The same is true of ravens, which, when tamed, are fond of throwing pieces of paper and other light combustibles on the glowing coals, and seeing them flash into flame. This favorite pastime renders them exceedingly dangerous inmates of the house; and it is probably this bird that was spoken of by Pliny as *avis incendiaria*.

Ants store in their chambered hillocks certain substances which, by fermentation, produce quite a high temperature, and are put there for the sole purpose of generating heat and warming their dwellings. Some birds, as, for example, the Australian megapode, or tungle fowl, hatch their eggs by artificial heat, resulting from the decomposition of the leaves and decaying substances with which they cover them, raising large mounds that are sometimes twenty or thirty metres in circumference, and serve as incubators for successive generations of birds. Thus, while it is true that animals do not make use of fire, they are not ignorant of the properties of heat, which they turn to practical account in matters of domestic economy and household life.

It is questionable whether Prantl's statement that animals "expect an effect but not a logical sequence, and seek a cause, but not a logical ground," can be maintained. The following incident, related by Dr. Schomburgk, director of the zoölogical garden at Adelaide, in South Australia, would seem to render such a distinction untenable. An old monkey of the genus *Macacus sinicus*, which was confined in a cage with two younger ones, flew at the keeper one day as he was supplying them with fresh water, and bit him so severely in the wrist as to injure the sinews and artery and to endanger his life. Schomburgk ordered the animal to be shot, but as an attendant approached the cage with a gun the culprit showed the greatest consternation, fled into the sleeping apartment of the cage and could not be induced, by any offers of tempting food, to come out of this place of refuge. It must be added that the monkeys were perfectly accustomed to firearms, which had been frequently used for killing rats

Digitized by Google

near the cage, and had never manifested the slightest fear of them. Even now the other monkeys ate their food as usual, with a conscience void of offense, and were not at all disturbed by the sight of the murderous weapon. No sooner had the man with the gun withdrawn and concealed himself than the old monkey sneaked out, and, snatching some of the food, rushed back into his asylum; but when he tried to repeat this experiment a keeper closed the sliding-door from without and thus cut off his retreat. As the man with the gun drew near again, the poor monkey seemed quite beside himself with terror. He first tried to open the sliding-door, then ran into every nook and corner of the cage in search of some way of escape, and finally, in despair, threw himself flat on the floor and awaited his fate, which soon overtook him. The conduct of the monkey in this case can be explained only by assuming the animal to have been endowed with a moral sense and a logical faculty, implying a clear perception of right and wrong, a consciousness of guilt, a knowledge of the use of firearms, and quite a complicated process of reasoning from these premises to a perfectly correct conclusion.

Perhaps the most human of anthropoid apes, as regards intelligence, is a species of chimpanzee called the soko, first discovered by Livingstone, and most fully described by him in his Last Journals. "The teeth of these creatures," he says, "are slightly human, but their canines show the beast by their large development. The hands, or rather the fingers, are like those of the natives. They live in communities consisting of about a dozen individuals, and are strictly monogamous in their conjugal relations, and vegetarian, or rather frugivorous in their diet, their favorite food being bananas." The aborigines, the Manyuema, are, on the contrary, cannibals, and are described by Livingstone as "the lowest of the low." One of them, who had killed a woman, offered his grandmother to be killed in expiation of his offense, and this vicarious punishment was accepted as satisfactory. Even the sokos have a higher and more correct conception of justice than this; at least they do not make the innocent atone for the crimes of the guilty. If a soko "tries to seize the female of another, he is caught on the ground, and all unite in boxing and biting the offender. Numbers of them come down in the forest within a hundred yards of our camp, and would be unknown, but for giving tongue like foxhounds. This is their nearest approach to speech. A man hoeing was stalked by a soko and seized. He roared out, but the soko giggled and grinned, and left him, as if he had done it in play." It is evident that these animals have some sense of humor and appreciate a practical joke. They are inoffensive and unaggressive, but fearless and energetic in self-defense. They never molest women or unarmed men, but if any one approaches them with a spear they rush upon him and wrest the weapon from his hands. If struck with a dart or an arrow, they pull it out, and stanch the blood by stuffing leaves into the wound. The natives recognize their harmless and human character, and say, "Soko is a man, and nothing bad in him."

Sometimes they kidnap a child and take it up into a tree, but they never hurt it, and are ready to exchange it at any time for a bunch of bananas. Perhaps the robbery is for the sake of the ransom. When roaming through the forest, the female usually carries her infant in her arms, but in crossing a glade or other open ground, where they would be more exposed to danger, the father takes the child, and returns it to the mother as soon as they enter the wood again. They are extremely fond of assembling in a remote part of the forest and drumming on hollow trees and other resonant objects, accompanying this fearful din with loud yells, like sopranos and tenors of strong pulmonary powers trying to outshriek the clash and clang of a Wagnerian orchestra. This deafening noise does not differ greatly from the "natives' embryotic music," and is quite as harmonious and pleasant to the ear as much of the music of the Chinese and other Oriental peoples.

Livingstone had a young female soko, which, after having been petted for some time, was "quite like a spoiled child." She enjoyed shaking hands, and took as

Digitized by Google

much pleasure in this tiresome manual ceremony as any American citizen who honors the president of the United States by calling on him at the White House. She liked to be carried about, and would beg people to take her in their arms. If they refused, she seemed greatly aggrieved, and would make a wry face, as if about to burst into tears, and wring her hands, apparently in severe distress of mind. She learned to eat whatever was set before her, drew grass and leaves around her for a bed, and covered herself with a mat when she went to sleep. She could untie a knot with her fingers and thumbs "in quite a systematic way," "looked daggers" at any one who interfered with her doings, and resented every attempt to touch what she regarded as her personal property.

Indeed, the idea of personal property, in distinction from communal property —such, for example, as the provisions stored by ants for winter—is quite as strongly developed in many of the higher species of animals as in some of the lower races of men.—*E. P. Evans in the Century.*

PROBLEMS IN FARRIERY.

BY S. T. H.

I. Concluding Reflections on Balancing the Action. II. Weight-bearing Portions of the Hoof.

As a prelude to this examination, it is germain to add that the objective point of these studies is the correct shoeing of the trotting horse, who, in connection with his inseparable double, the fleet-footed pacer, is not only the exceptional swift light-harness horse in existence, but the most difficult to keep sound in limbs and feet by shoeing.

These observations apply to the ease and comfort of all horses, but more especially to those of the diagonal and lateral gaits, whose foot exercise and resultant concussion are excessive. Speed demands the greatest skill in shoeing; and the requirement of the present day of the trotting horse is not only speed, not only extreme speed, but the very ultimatum of extreme speed. The breeder and the trainer as well as the farrier must all contribute their share to this consummation. In order to secure this superlative merit the trotting horse must be, what has become the nausea of trotting parlance, from its captious repetition by grooms, race track habitues, trainers and breeders alike, "*a good individual.*" To be a good individual, it is now becoming an accepted truism, that, in addition to the brain capacity, and the physical conformation being of the highest order, the movement must indicate that he is a "*line trotter.*" But few horsemen comprehend the entire significance of these terms when applied to the subtle laws that govern his locomotion.

To be a line trotter not only the limbs and feet should be in coincidence, but the axis of the body should be in a line with the axis of the extremities. Every part of the animal mechanism, to use a builder's phrase, should be exactly plumb. This is one of the great secrets of the Electioneer success. Head, neck, body, limbs and feet, all work harmoniously together in a straight line, and the kindergarten track, where the Electioneers are given their elementary lessons in trotting, and where the natural carriage of each colt is carefully noted and preserved when subjected to harness, has contributed powerfully to this end.

If the head, in motion, turns to one side, as in the case of so many trotters, who are thereby rendered so troublesome to handle, there is a positive conflict of mechanical forces; because, this very influential factor, in determining the direction of the locomotion, is carried out of line. If the head is out of line, the feet will be just as much out of line in order to preserve the center of gravity of the carcass. This is manifest by the frequent ankle-cuffing and knee-banging in front, and the more serious ankle and shin interferences behind, on the limbs toward which the head inclines. If the head is carried straight, and one or more feet

Digitized by Google

turn either in or out, the same disturbances occur. Interference is the most powerful hindrance to speed. Nothing destroys ambition to forge ahead like this hindrance to clear action. For this reason the movement of the trotting horse is now being regulated with an approximation to scientific accuracy. His pedal extremities are being more closely observed than ever with reference to ascertaining the exact laws of their mechanical action. The head and neck, too, are receiving their meed of thoughtful experimentation by the master reinsmen. But nothing, as yet, has been written about that important posterior steering oar, the tail. It is the uniform practice of the average trainer to pull the tail up, out of line, twist it to one side, and then wedge it immovably between his own body and the seat of the sulky. This valuable appendage given to the horse, not only to protect his sensitive hide from flies, but to control, to a certain extent, the slightest variations of movement, that disturb his center of gravity, is thus lost or rendered impotent under the foolish impression that the flag—generally out straight in a line or slightly elevated, might possibly hang down between the hind limbs and the hair interfere with the propellors. The tail should be unrestrained. When the horse steps upon uneven surfaces, or is forced out of his straight course on either side by a sharp pull on one rein as the exigencies of a trial or a race may require, as well as speeding around the turns, the average trainer recognizes how much assistance he may prove to him, by steadying his center of gravity, either by lifting his head and neck into equipoise, or by helping with greater pressure upon one rein than the other. But apparently he rarely realizes how materially the horse may right himself up by the instant use of his tail, somewhat as the birds of the air do in their varying flights, if that member was left free for his own manipulation. Then again many a professional driver seems to think that it adds force and bravo to his handling of the reins if he sways his body over to one side and daringly hangs from the seat in a tangent to the line of motion. His reflection has never taught him to realize that he is thus handicapping his horse with an opposing force, instead of really affording him the assistance that he is anxious to render. Sulkies, too, are multiplied with such alarming rapidity, fortified with so many patents of improvements, real and fanciful, that the prime necessity of a perfect balance of all the parts, attended with the least possible friction, is in danger of being lost in many of them. The center of motion of the vehicle should be in line with the center of motion of the horse; and to insure this result the sulky should not only be perfect in all of its proportions, but the horse should be so fastened to it that no opposing forces should be created against the correct draft line. When the shafts of the sulky are raised to the height in the tugs that they should properly occupy, so that the draft line from the shoulder points to the axles is correctly adjusted, the center of motion of the burden to be drawn is in the center of the seat, immediately above the center of the axle. From that point, therefore, to all corresponding points, on both sides, posterior and anterior, wherever it is possible to take measurements, the several parts should have the same relative distance from the center of motion, just as the corresponding parts of an accurately balanced hoof measure alike from the cleft to the frog. For instance: the distance to the shoulder of each spindle should be mathematically the same; and so should the distance to each foot rest, and to the point of each shaft, with the line of curvature exactly alike, and to each angle and bend of the framework in the rear part. The diameter of the wheels should correspond to the minutest fraction of an inch, and the arms should be welded on to the axles at precisely the same angle, so that the orbit each wheel circumscribes should be alike and the friction of movement thus reduced to the minimum. Then the entire vehicle in all of its parts would be as perfect in equipoise as the accurately adjusted mechanism of a thoroughly regulated chronometer; many sulkies that are now loaded down with patent improvements would be materially benefited if their builders thought less of trusses and more of perfect proportions.

With all these precautions for securing co-operation, the horse can the more

Digitized by Google

easily be taught to become a line trotter. Doble or Marvin or Williams or Splan mounted behind a champion afford a graphic illustration of the force of these observations. Man, vehicle and horse all seem to be component parts of the same harmonious mechanism. When they come down the home-stretch in a painfully critical finish, there is no conflict of forces; no swaying of the body of the reinsman; no twisting of the carcass or limbs, or tail of the horse, but all are intently subservient to the one great desideratum of extreme speed, in a straight line, without which the two-minute trotter can never possibly materialize. This completes the consideration of the subject of balancing the horse, and we turn to the weight-bearing portions of the hoof.

The continued preservation of sound feet, when subjected to iron shoes, riveted on with unyielding nails, of the most tenacious iron, from the world-wide famous works of Sweden and Norway, and to the tremendous concussion of the race track, at full speed, or the hard macadam of our highways, depends largely upon a correct bearing of the iron plate upon the parts designed by nature to sustain the weight.

Remedial devices for foot lamenesses require this bearing to be distributed with scientific adjustment. If this can be determined by the combined mastery of the anatomical, and mechanical action of the foot, fortified by empirical demonstrations, then a great advancement has been made in the complicated art of farriery.

Institutions of practical farriery should should be established by the leading governments, wherein civilization demands the constant services of the highest forms of blooded horses. The United States should have a governmental smithy, where all the theoretical and practical knowledge that can be brought to bear on this subject could be systematized and taught to the horse-shoers. Not only this country but England who has developed the blood-horse, and given to the world more distinct types of horses than any other nation, has signally failed to establish these necessary institutions of practical knowledge.

Mr. Fleming, on page 107 of his premium essay makes this remarkable admission.

"The English government does nothing to improve veterinary science in any way. Hence the low state of this important branch of medicine in Great Britain. Hence, also, the degraded and barbarous condition of farriery, even in our cities and towns. With the exception, on very rare occasions, of the distribution of a prize or two, at some local agricultural show, to farriers (who imagine that paring and rasping and a fantastically wrought piece of iron constitute the acme of shoeing), the subject is thought unworthy of notice. Even at the veterinary schools, during my matriculation, farriery was dismissed in the brief lecture of an hour. Nothing of the principles or practice was even referred to, or taught."

Professor Gamgee, in his preface, gives equally deplorable testimony.

"This volume (he writes *Treatise on Horse-shoeing and Lameness*), now submitted to the public, is in extent, as a drop, added to the sea of books, which have appeared on the same subject during the last half century. It is, however, the result of study and observation of fifty years, constantly spent in the practice of the veterinary art, and the prevention and curing of lameness, fifty years of apprenticeship pupilage, practice and teaching. After years of oscillation from one set of errors to another, during which I had found that very much I had been called upon to believe and rely on, as scientific knowledge, was nothing but verbose trash, or the expression of crude hobbies. I trust that this work may be judged, as an earnest attempt to teach accurately and to counteract the effects of the injudicious teachings of the last three-quarters of a century."

These sweeping denunciations, of both pathological and practical farriery, of these pre-eminent authorities, on shoeing, in England, would lead the student of this specialty to hope that they are in accord upon the proper methods of paring the hoof and of nailing on the correct forms of shoes, so that the feet would be preserved in their normal shape and con-

Digitized by Google

dition, and that the functions and mechanical action, both externally and internally, would be constantly brought into use, to insure the continuance of healthy feet, and to restore those that have been distorted into abnormal shapes, and tortured with the many forms of lameness, that veterinary works scarcely do anything more than classify. *Yet the careful perusal of their monumental works profoundly disappoint the reader; for their teachings are in direct opposition to each other.*

In these respects the most intelligent of American farriers are far in advance of these leading English authorities. In the large cities of this country there are smiths like Hughey of Philadelphia, and Russell of Cincinnati, and the skillful shoers who traveled with the great trotting stables of the winning campaigners, and there are trainers like Doble and Splan and Marvin, whose success has largely depended upon the proper conditioning of their horses, which includes the perfect preservation of the feet and limbs, who could instruct both of these English professors in the art of paring and forging shoes, best adapted to the intricate wants of that most difficult of all horses to keep sound upon his feet, the swift light-harness horse. The reason is obvious. Like the learned professors, they have not only dissected green feet, and noted the action of tendons, ligaments and joints, but they have sat for years behind the light-harness horse, in the sulky, the best possible arrangement for studying the poise of the body, the swing of the limbs and the revolution of the feet. *Body, limbs and feet, as has been herein elucidated, must move in a straight line to insure perfectly balanced action.* The pole or straps to straighten the hind parts, carried out of line, the compensation in paring the hoofs to make the tilted knee or ankle joints to articulate with even precision in their journals, the proper length of the toe and height of heel to bring into full, yet harmonious play, the flexor and extensor muscles with their tendinous prolongations. All these are intricate problems in farriery that neither the English, nor French nor German nor Italian farriers have ever had presented to them, simply because they have no swift light harness horses, to any extent, either trotters or pacers, that constantly bring these difficulties up for the solution of the horse shoer.

But all farriers, American or foreign, must alike start from the same point, when the uplifted foot is pressed between the knee clamps of the operating smith. How shall the hoof be prepared, so as to bring the pressure upon the wall sole, bars and frog in the manner designed by nature? What are the instructions of these eminent foreign authorities upon this vital enquiry? Mr. Fleming, with a commendable display of learning, strengthened by experimental practice, as an English army farrier, stoutly insists that "*frog pressure is necessary to expand the foot and to promote the healthful growth and action of the hoof.*" He therefore earnestly recommends the use of thin-heeled shoes, and even of "tips," which permit the frog to bear directly upon the ground, at all times, as the wise provision of nature for expanding the hoof, thereby aiding the elasticity of the hoof in rapid action, and preventing the legion of diseases that afflict it in the domesticated horse.

Professor Gamgee, the self-constituted iconoclast in his profession, on the contrary, comes to directly the opposite conclusion. These two authorities are selected because they represent the two antagonistic schools that have been opposed to each other on the weight-bearing portions of the hoof since the earliest beginnings of farriery. Palpably the whole question rests upon the functions of the frog. If the frog bears upon the ground then the bars and the sole must bear a portion of the weight in a thin-heeled shoe, even though that proportion of weight-bearing capacity be secondary. In tracing their conclusions we are, therefore, presenting a resume of the entire literature of this subject.

By reason of a series of scientific experiments, Professor Gamgee comes to the conclusion that the frog does not exert any agency whatever in expanding the hoof. He claims that corns and thrush are not caused by the elevation of the frog from the ground, thereby producing contraction, which thus concentrates the

Digitized by Google

concussion upon the angle of the heels that encourages corns, and by lateral shrinkage so presses upon the frog as to cause thrush and the wasting of the frog. He affirms that corns arise simply from improper shoeing, and thrush from the constant moisture and decomposition always taking place in the unclean stall, without proper drainage, where the suffering horse is compelled to stand.

Over against Mr. Fleming's assertion that, in the English army and elsewhere, he has cured thousands of lame horses merely by placing the sole, bars and frog upon the ground, so that, as he argues, each part can bear its proportion of the weight, Professor Gamgee defiantly claims that "*in London and Edinburgh, where this thin-heeled method of shoeing is practiced, over forty per centum of the horses in general use are lame.*" In Paris, on the contrary, where the Charlier method of shoeing is abandoned, he asserts, only nine per centum of the horses in general use are lame, by actual enumeration, *simply because the frog is not permitted to rest upon the ground.*

Mr. Fleming, on page 57 of his well written essay, elaborates in detail, the injuries arising from calkins that raise the frog above the ground. "Calkins, he "forcibly writes, are injurious to the "limbs in proportion to their height. "When smallest they are an evil, as they "have a tendency to raise the back part "of the foot higher than the front; to "alter the natural direction of the limb; "to throw undue strain upon the fore "part; to jar the limb and expose it to "twists; to induce shortening of the "flexor tendons; to interfere with free "action; and to throw unnecessary "strain upon the nails and hoofs. Neither "must it be forgotten that they remove "the frog from the ground. All these "observations (he adds), are the result of "many years of study of farriery in "Glasgow and Manchester and of fifteen "years' practice in the army."

Strangely, he omits the main objection to calkins. They obviously concentrate the pressure and resultant concussion upon the heel points, like two projecting spikes, and then, when the foot revolves, upon the toe calkin, instead of dissipating it around the entire margin of the wall. This concentrated concussion is enormous, when it is remembered, that the pressure upon the bottom of the hoof of a horse, weighing one thousand pounds, and trotting at the rate of a mile in two minutes and forty seconds, has been estimated to be equal to one thousand pounds of pressure to each square inch. To illustrate the intensity of pressure and resultant friction, it is well known that many a race-horse, upon the full gallop, has bolted the track, because his feet, though shod in the lightest possible frictionless plates, have become so heated upon a firm track, as to cause an intensely burning pain. No horseman appreciates the extent of this friction unless he has had sensible demonstration of its existence. The writer was once seated in a road-wagon, behind a celebrated turf mare, who was drawing her owner and himself for a brush, a quarter of a mile in thirty-six seconds. One of her front shoes was thrown off, and came ringing, with a dangerous singing, like the stinging buzz of a threatening wasp, past the writer's ears. The accident was noted, and the horse slowly pulled to a stop, then turned and driven back more than fifty yards, to where the shoe lay upon the ground. *He alighted and hastily picked up the shoe, but it was still so hot, that he quickly dropped it for longer cooling.*

Now if the friction is so great as to cause intense heat, when the shoe is a thin, light, concave seated pattern, that enables the hoof to come almost flat-footed upon the ground, its base of action, how much more magnified must it be, when concentrated upon three isolated points by the three calkins of the shoe? Calkins certainly do clog the action. They cause the foot to land quicker than do either the plain shoe of uniform web, or the thin-heeled shoe. Moreover they retard the articulation of the coffin joint, just as the rolling motion shoe accelerates the joint movements of the hoof and limb, and thereby correspondingly retard all the joints to the carcass. Who can estimate the handicap that many a trotting horse thus suffers from heel calkins on his hind shoes, by reason of this concentration of concussion, and resultant heat, and fettered articulation, where he

Digitized by Google

needs no remedial appliances to correct faulty action? Who, that is versed in the mathematics of trotting forces, can calculate the hindrances to the momentum of the superb trotting horse, Nelson, all of whose four feet are thus armed with heel and toe calkins?

But to return to the literature of the English authorities on calkins. Professor Gamgee, in the face of this opposition of Mr. Fleming, thus grows eloquent in their defense.

"Englishmen have a dread of calkins "on shoes. Such appendages are against "current notions on the economy of the "horse's foot, no amount of old, or even "surviving experience to the contrary "availing. It has never been denied "that in Switzerland, the Tyrol, and the "whole of Germany, from the sources of "the Rhine and Elbe to that of the Dan-"ube, horses work all the year round "with shoes armed with calkins, and, in "the case of heavy draft horses, with toe "pieces also; equally certain is it that "the free movement of these horses, and "proportionally, little lameness is as con-"spicious over that vast part of Europe "as the opposite is in England."

The question of the healthful preservation of the foot, armed with calkins, when subjected to great speed, never enters into this English discussion. Probably Professor Gamgee would not place calkins upon the racing plates of the English thoroughbred race horse; nor would he upon the rapid American trotting horse. Not, primarily, because they would be injurious, but that they would hinder and retard the action so perceptibly as to injuriously affect their highest speed. Calkins are placed upon draft, coach, and all horses of the slower classes, all over the world, to secure a safer foothold and prevent slipping; but whether they promote or lessen the sanitary conditions of the hoof and its contents can be more readily determined in violent action than either in walking or jogging, for then, and then only, are the severe effects of raising the hoof so high above its base of action certain to result.

Thus do the leading authorities of England, and, indeed, of Continental Europe, radically differ upon this primal proposition of frog pressure. The careful reader can now appreciate how trifling has been the progress of veterinary science upon this fundamental inquiry of farriery, as to what is the office of the frog, when informed that this same grave question, whether calkins are injurious or not, agitated the leading colleges during their earliest existence in France and England.

In Johnson's Sportsman's Cyclopedia, London, 1831, we learn, on page 348, Mon. St. Bel, the founder of the Royal Veterinary College, contended that: "The "use of the frog is merely to serve as a "cushion or guard to the tendon of the "flexor muscle of the foot." On that account he instructed English smiths to raise the frog from the ground by a thick-heeled shoe. His successor, the great Professor Coleman, eminent as a human physician, as well as a veterinary surgeon, maintained that: "The law of its nature "demands that the frog should press upon "the ground in order to perform its func-"tions; that unless it sustains uniform "pressure, the heels as well as the frog "contract. But if that organ be in close "contact with the ground, then it spreads "and is free from thrushes and canker, "and operates as a wedge to keep open the "heels of the hoof. On this princi-"ple," (he concludes) "I long since rec-"ommended a shoe with thin heels, as "the best adapted to bring the frog upon "the ground."

Thus after the lapse of three-quarters of a century of investigation, and practice, and learned controversy, the great veterinary authorities of Europe are at sea upon the inquiry: "What is the office of the frog when the horse moves from a position of absolute rest and takes a single step? They disagree upon the initial inquiry: How shall he put his foot down upon the ground, so that the cushion, in its posterior lower surface, shall bear only just such pressure, if any, that nature designed, among the weight-bearing portions of the hoof?

Until this question is conclusively determined, beyond the possibility of controversy, there can be no scientific progress in farriery.

These great authors have certain premises of agreement. They both correctly insist that the foot, as the terminal ex-

Digitized by Google

tremity of the limb, is the last phalanx of the digit; that practically, as well as scientifically, it is of no value to examine the anatomy and mechanical action of the foot by itself; but that the entire limb must be dissected, and articulated in connection with the examination of the functions of the foot in all of its bearings.

They both concur in the general belief that the great majority of the disorders that afflict the horse's foot come from defective shoeing. Mr. Fleming, on page 12, thus forcibly bemoans this fact:

"A large percentage of lameness is due "to faulty shoeing. *The art of farriery* "*in this country (England) has never re-* "*ceived a scientific development, but has* "*ever been a mere affair of routine and* "*tradition.*"

Professor Gamgee, taking up the same refrain, adds:

"Most of the malformations and in- "firmities of the horse's foot are produced "by defective shoeing, and can only be "remedied by correct shoeing." And yet if the anxious smith should apply to these authorities, as to what disposition he should make of that perplexing V-shaped cushion of spongy horn that separates the bars and walls at the heels, the one would exclaim: "Raise it from the ground and from all pressure, because it is designed merely to act as a cushion for the downward stroke of the flexor tendon." While the other, with equal vehemence, would as confidently instruct him to "place it squarely and firmly upon the ground to insure its healthful conservation, and to prevent both corns and thrush, because it is not only a primary weight-bearer, but acts as a wedge to force apart the heels, and thus avert that greatest of all hoof calamities, the contraction of the wall at the quarters and heels."

If the bewildered horse-shoer should turn from them in discouragement, and appeal to the great body of English veterinary professors, Professor Gamgee says his satisfaction would be still more unappeased, for he adds:

"Veterinarians have long since aban- "doned farriery and the shoeing forge "as the ungentlemanly part of their pro- "fession."

In this country no such mawkish sentimentality afflicts the veterinary surgeon. His daily practice leads him to the forge, where he instructs the smith how to pare the hoof, and how to arm it with the shoe. He seeks to know more than mere pathological shoeing. To classify and give the causation of foot disorders, are only preliminary to the remedial methods he instructs the horse-shoer to apply. Yet he is no farther advanced than his confreres across the great waters, on the question, "What are the functions of the frog? Is it a primary or a secondary weight bearer? If neither, what are the offices in the economy of the foot?"

Before considering this matter it is necessary to determine the bearings of farriery on the other portions of the foot, especially the bars and the sole.

ONCE AROUND THE GLOBE.

BY R. C. A.

Introduction.—It is proposed in this article to show how the horse, in the course of its evolution or development, has made a complete circuit of the globe, starting from its original home and ever pursuing the course of the sun, still westward, till it found itself again in its prehistoric haunts.

In doing this, we shall have to deal largely with what is called the buried history of the horse, as established by "speaking" evidence discovered in the shape of fossil or diluvial remains. From such a study we believe that horsemen can learn much to interest them.

Hard-headed, practical men — horsemen, as well as others—are sometimes inclined to sneer at knowledge of their particular pursuits not gained within the precincts of the stable or the track. Science can afford to overlook that, for the horse has, from a biological point of view, furnished the most splendid modern instance we have of the grand results of time. The horse, it may be epigrammatically said, has been making the running

Digitized by Google

for the modern theories as to the evolution of existing species of animals.

Instead of further constructing for the reader a preliminary synopsis of this thesis, *i. e.*, detailing beforehand the results we have arrived at, we shall plunge him at once, *in medias res*, and allow him to make his own mental summary. But we shall mark off the stepping stones, so that he may know how far he has advanced in this newly conducted globe-trotting tour.

The Original Home of the Horse.—It is now an established fact that America is the original home of the horse. For this knowledge we are indebted to the geologist and the paleontologist. These scientists have proved that during the whole of the tertiary formation (which geologists divide into three periods, the eocene, miocene and pliocene—of each of which there are early, middle and later periods) this continent was occupied by horse-like mammals of many and various forms. These all became extinct before the discovery of the country by the occidental voyageurs, so it would evidently appear.

But their abundant remains furnish the materials for making out the genealogy of the horse in an unbroken succession of forms.

The study of their fossils has shown that the oldest representatives of the horse on this continent all had many toes, and were of small size. In the course of time there was a gradual increase in size and a diminution in the number of their toes, until the present type of horse was produced. The line of genealogy has been made out through seven successive stages, and the fossil proofs of its validity and completeness can be seen in the museums. All the facts go to show that the horse tribe is derived from an original ancestor having five toes on each foot, but this parent progenitor has not yet been discovered in perfectness. The oldest member of the group that has become known, and the last also to be discovered, is the *Eohippus*, which has four well-developed toes, and the rudiment of another on each fore foot, and three toes behind. It was about as large as a fox, and appears in the lower eocene or at the base of the tertiary formation. The *Orohippus*, in the next higher division of the eocene, resembled its predecessor in size, but had only four toes in front. The *Mesohippus* came later, and was about as large as a sheep; it had three usable toes, and the splint of another on each fore foot. In the later *Miohippus* (*Anchitherium*) the splint bone is reduced to a short remnant. In the pliocene above occurs the three-toed horse *Protohippus* (*Hipparion*), about as large as a donkey. Still higher, a near ally, *Pliohippus*, of the modern horse appears. The series is complete in the subsequent appearance on the scene of the true *Equus*, as large as the present horse, and of various species.

Discoveries of fossils made over such a wide range of territory, from Behring Straits to Patagonia, have revealed the fact that in North and South America there have existed many species of the genus Equus, and thirty more species allied to them. These discoveries have proved indisputably the filiation of equine ancestry from the quatenary to the eocene and the progressive evolution of the horse from a many-toed ancestry. Species of fossil horses have been found in North America which are closely allied to the present living animal. Professor Cope, the distinguished American paleontologist, has described these closely allied species in the *American Naturalist*, and in other papers.

The discovery of these remains is no new thing, however, but their significance and what they could tell us was for long not suspected. Captain Beachy had formerly obtained many specimens from the mud cliffs of Eschscholtz Bay, where they were found associated with the bones of the mammoth, and a fossil or extinct ox (a bison). Mr. Darwin had observed horses' bones mingled with those of the mastodon, which had been several times transmitted to England. These, it was always imagined, were modern horses' bones accidentally thrown in with the mastodons'. Mr. Darwin found the fossil tooth of a horse in the red clayey stratum of the pampas, at St. Fe, South America, together with one of the extinct toxodon, and also another at Bahia Blanca, imbedded with numerous fossil remains of extinct animals of the edentate order, in a beach covered at springtides. In the

Digitized by Google

caverns of Minas Geras, a mining district of Brazil, the relics of a species of horse (*Equus curvidens*, Owen) have been found in considerable numbers.

Thus, then, did certain species of horse live coeval with the mammoth, the mastodon, and the megatherium, in past ages, throughout America, from north to south.

The Evidence of the Horse's Descent from a Differently Formed Ancestor.—One thing that comparative anatomy has proven, and which is now one of its most elementary axioms, is, that the animals of the vertebrate type are all constructed on a uniform plan. For instance the various parts of the body as determined by the skeleton are made up of similar analogous parts. Thus, taking what are technically termed the hands and feet of vertebrates, it appears that five fingers and five toes is the perfect number, as seen in man and other animals. But how can the horse, a vertebrate, be said to be formed in such a way? He has, it will be exclaimed, no toes at all! That is just where we have been so long mistaken, and what the past has, as discovered by the scientists, made beautifully clear to us. The original ancestor of the horse had five fingers and five toes.

It may be convenient here to give a summary table of the various forms of horses that have existed, showing, at a glance, the links connecting the five-toed ancestor with the one-toed individual of to-day:

1. *Eohippus*. Period: Early eocene. Size: as large as a fox, Toes: fore foot, four well developed, with rudiments of fifth; hind (four ?).

2. *Orohippus*. Period: Eocene. Size: somewhat larger. Toes: fore foot, four, fifth disappears.

3. *Mesohippus*. Period: Miocene. Size: as large as a sheep. Toes: fore foot, three, with rudiments of fourth; hind, three.

4. *Miohippus* (parallel to *Anchitherium* of European series). Period: Upper miocene. Size: somewhat larger than last. Toes: fore foot, three and slight rudiments of fourth; hind, three.

5. *Protohippus* (parallel to *Hipparion* of European series). Period: Lower pliocene. Size: about that of an ass. Toes: fore foot, three, the middle largely developed compared with laterals; hind similar, but the "extras" not so well developed.

6. *Pliohippus*. Period: Pliocene. Size: larger. Toes: fore foot, one, small hooflets of laterals gone; hind, ditto.

7. *Equus*. Period: Upper pliocene. Size: horse, Toes: fore and hind feet, one, with rudiments of splints.

As we shall now attempt to show how the horse came to be so *imperfect* as to number of digits in becoming the perfect locomtory ideal, the possessor of a so "wonderfully constructed foot," as Fleming describes it, the reader must imagine he has before him the hand of a man, and a hand or fore foot of a many-toed horse. We shall then start at points where horse and man had the normal number of digits irrespective of the "periods" during which each were so possessed.

Dealing with portions of the hands and feet known as the carpus (wrist) and tarsus (ankle), the following table will show the existing parts in each animal:

ANALAGOUS PARTS IN "HAND" AND "FOOT" OF MAN AND HORSE.

Fore Extremity.

Man.	Horse.
Wrist (*carpus*)	Knee
Hand—palm (*metacarpus*)	Leg (cannon, splints)
Knuckles	Fetlock
Finger (*middle*)	
1st phalanx	Large pastern
2d "	Small "
3d "	Coffin bone

Hind Extremity.

Man.	Horse.
Ankle (*tarsus*)	Hock
Heel (*os calcis*)	Point of hock
Foot—sole (*metatarsus*)	Leg
Ball of foot	Fetlock
Toe (*middle*)	
1st phalanx	Large pastern
2d "	Small "
3d "	Coffin bone

We shall take the hand and forefoot alone for comparison. It is the digit corresponding to man's thumb, pollex or first finger, in the horse, that has been the first to be withdrawn from use. That was the first change in the *Eohippus*, the immediate successor of the full five-toed horse; the thumb occurred as a rudiment. In the four-fingered *Orohippus* it has disappeared with the corresponding metacarpal, leaving the second, third, fourth and fifth.

Digitized by Google

It may be as well to say here at once that it is the third or middle finger (and corresponding toe) of man that the one finger (or toe) of the horse of to-day represents, and that it is the fingers (or toes) on the other side that have been, alternately, withdrawn. Instead of the second finger being the next to be withdrawn, therefore, it was the fifth or little finger on the opposite side to that of the thumb.

Mesohippus was the first horse that appeared as having got rid of the fifth (and first) digits and corresponding metacarpals. Then there were left the second, third and fourth—one on each side of the third or middle, it will be noticed. These occurred and were present in the *Mesohippus*, *Miohippus* (*Anchitherium*), and *Protohippus* (*Hipparion*). But in each successive form there was a gradual and sure withdrawal of the digits on each side of the main finger, *i. e.*, of the second and fourth. In the *Pliohippus* these fingers (second and fourth) had been got rid of altogether, leaving necessarily reduced metacarpals. These second and fourth metacarpals were subcutaneous, and were more or less fused, apparently, to the middle metacarpal or cannon bone. Now the path was cleared for the advent of the modern horse. The second and fourth metacarpals became more reduced, till they became mere rudiments on either side of the cannon bones of the horse. They remain in evidence, however, of the former condition of the animal, as mere vestiges known as the splint bones.

Thus we have followed the successive steps in the gradual withdrawal or disappearance of the first, second, fourth and fifth digits.

Man uses the entire length of his foot for resting; he, therefore, is called palmigrade or plantigrade. The horse, however, supports himself on the tips of his (third) "toes and fingers" covered by the hoofs (nails). He is called unguligrade (*i. e.*, going on hoofs). The horse, in fact, supports himself entirely on the digits named, as a *premiere danseuse* seems to do as she pirouettes down the stage, which she does, however, on her big toes.

Cause of Reduction in Number of Digits.—As to the causes of digital reduction, Professor Cope has shown that in plantigrade quadrupeds the extremities of the toes are arranged in a semi-circle, when they are all applied to the ground. In the act of running, the heel and wrist are raised, throwing the weight of the body upon the median digits. An infinite repetition of this posture in digitigrade creatures unable to withstand the attacks of their enemies, and whose only escape was in flight, the strengthening of the median digits, and the consequent reduction of the outer ones, would follow according to the law of use and disuse of parts. This subtraction of toes has progressed step by step, until the modern one-toed horse has been reached.

When the hand of man is palmed on a flat surface, with the fingers expanded to their widest, the "circle" is beautifully apparent. Marking the points where the five tips situate themselves, a circular line can be perfectly drawn by connecting these marks. If the hand, again, as above described, is gradually gathered up from the prone, in such a manner as to allow the tips of the fingers to rest on the surface, but still extended, it will be seen that, on continuing the movement, the first to become free is the thumb, (*which has but two phalanges*); next, the little finger; next, the second; then the fourth; leaving the longest, or middle finger, as stated in table above, still planted on the surface. This was the exact mode of the horse's rise, or behavior in his evolution, from the plantigrade to the digitigrade. And the appearance of extra digits, as atavisms, of course, would occur from the fourth, second, fifth, to first (or thumb) finger; and it so takes place.

There is a curious belief common among a certain class of people that "unusual length of the first joint of the fingers is an indication of blue-blood." As it is by the greater lengthening of the first phalanx, at the expense apparently of the second and the third, that the increased length of limb in the horse is attained, which tendency he has inherited from distant ancestors, the curious belief mentioned has some interest for us.

The process of elimination, remarks Professor Cope, is not necessarily an evolu-

Digitized by Google

tion or survival of the fittest, in the sense of modern derivationists. It rather implies that in certain past conditions of the earth, the conditions of life afforded scope for many forms not now required, or replaced by other types more suited to the advanced and specialized nature of the animal's environment.

The horse has thus advanced in his development by becoming more simple in the anatomy of his feet; he has got rid of the superfluous toes or digits. But as the imperfections of the sire appear even to the third and fourth generation in the son, so it is in the horse; as seen in the occasional appearances of extra, if rudimentary, hoofs—indicating an undeniable connection between the sire and son as all of one source, which will now be noticed.

Atavism Proves the Alleged Descent.—That the claim that these various forms existed, not simultaneously, but in succession and independently, we have, fortunately, the record of certain investigations and facts, which at once proves the descent thus traced out.

For instance if, in modern horses, we find parts of the animal similarly constructed to parts which were peculiar in formerly existing times or species, we have surely an unassailable argument in our favor.

It is not the "hands and feet" alone of the horse, or their fingers and toes, or the wrist or ankle, in which modifications in the above series are observed. Corresponding changes have taken place in the bones of the forearm and of the leg. The outer bones of both—the ulna and the fibula—have undergone a corresponding degradation—absorption or obliteration.

Now, if the present horse is a descendant of the formerly existing form, and, admitting, as everyone does, the force of the argument of atavism, we would expect, the case would demand it, that the present-day horse should be unable to live its race life, if there were not born individuals with peculiarities altogether novel to our present conceptions of proper horse anatomy, but which in previously existing times were normal. What does that prove? Simply that the blood, to put it in a way that will best convey understanding, exists in the horse of to-day that existed in the polydactyle equine of earlier, geologic times; that both are of one continuous line, from one source.

As said, it is not alone the fingers and toes, but the bones of the arm and leg that show this. In recent horses and asses have been observed cases of a complete and uninterrupted ulna—quite different from the usual condition found in the true modern horse, where the ulna is, in its middle portion, greatly reduced and even interrupted and connected with the radius in young animals by means of sinews, and in old ones by bony growths.

Prof. A. Nehring, of Berlin, produced, in 1882, the forearm bones of a horse of the Cleveland breed, and also those of an adult ass. Those specimens showed that in *Equus caballus* and *E. asinus*, the ulna is sometimes so far developed as to take the form of the ulna of *Hipparion*. Such cases are more common in the horses of heavy breeds than in those of lighter frame; they are also more common in the ass, which seems to represent a more primitive type among the recent Equidæ.

As for the fibula, it is so degraded in the recent horse as to consist merely of a rudimentary portion above, and a lower joint-piece intimately attached to the tibia. Sometimes, however, as in the Cleveland horse above mentioned, the fibula, though not complete, has the interval between its upper and lower remnants much smaller than in the majority of horses—not larger, indeed, than is found in *Hipparion*. According to Mr. Steel, complete and uninterrupted fibulae occur sometimes in the ass.

To us those departures from the normal equine type are cases of atavism or reversion to ancestral forms. They afford the evidence which satisfactorily connects the recent Equidæ with their fossil progenitors. If atavism is recognized as explaining individual peculiarities in present races as being derived from more immediate ancestors, so it must hold good in explaining the derivation of other race peculiarities from species of former ages.

Professor Marsh said, 1880: "In addition to each main digit of the ordinary

horse, the anatomist finds concealed beneath the skin two slender metapodial 'splint-bones,' which are evidently the remnants of two other toes originally possessed by the ancestor of the horse. It is an interesting fact that these splint-bones are sometimes quite fully developed, and may even support extra digits, which are much shorter and smaller than the main foot. As these small hooflets are usually regarded as a serious detriment to the animal, they are generally removed from the colt soon after birth, but, in such cases, the enlarged splint-bones not unfrequently indicate in the adult their former existence. Numerous cases of extra digits in the horse have been recorded, and in nearly all of them a single lateral hooflet was present on one of the fore legs."

George Simon Winter recorded two cases of polydactyle horses, in his famous work on horses, published at Nuremburg, in 1703. Other cases have been recorded by Geoffroy St. Hilaire, Owen, Leidy and others. Professor Marsh examined an interesting case that appeared at New Orleans in 1878. This animal was of small size, and about ten years old. The four main hoofs were of the ordinary form and size. The extra digits were all on the inside, and corresponded to the index finger of the human hand. They were less than half the size of the principal toes, and none of them reached the ground. With the exception of the extra digits this horse was well formed. He was known among showmen as the eight-footed horse, from Cuba, where he was said to have been foaled. The writer reported a case in the *American Naturalist*, May, 1889.

The famous Bucephalus was of this polydactyle nature. Odin's horse is sometimes described as "the eight-footed Sleipnir," and would thus appear to be of the same kind, but as he is also described as "the eight-legged," we can hardly be certain. Gmelin, in the thirteenth edition of the System of Linnæus made two divisions of the genus, the first being *Molinus Equus Bisulcus*, "now universally regarded as fabulous" (Hamilton-Smith). The Koomrah or *E. hippagrus* of northern Africa was an animal supposed to have been "a species of monstrous mule, between the mare and the bull." Lawrence mentions the Jumard as being "well known in many countries upon the European continent," he calls it a mule resulting from the conjunction of the horse and cow, of which "we know practically nothing in this country (Britain)." In 1768 there was produced at Thorney Abbey, in the Isle of Ely, "an uncommon creature"—a curious mixture of calf and foal. We allude to these because they help to explain the animal known by the name of hippotaurus, "which was believed to be a possible creature down to the middle of last century." These hippotauri themselves may have more value "as evidence" than they have been yet credited with. They seem to be the reminiscences crystallized in so-called fabulous mythology (but which seems to be proving itself not so fabulous as supposed) of previously existing kinds of equines such as we have seen did previously exist.

Besides the limbs of the horse there are other parts of the animal's anatomy which prove, unmistakably, its descent from and connection with such forms as are claimed as its ancestors. Among these points are: the teeth, the orbits, the guttural pouches, and other parts. All these are too interesting to attempt to deal with here.

There are certain curiosities in this connection, however, that we may allude to. These are the "ergots" or spurs embedded in the hair of the fetlock, and the "chestnuts" on the extremities above the knee, in front; and below the hock, behind. Youatt described the latter as "sallenders and mallenders," and from him people were led to believe that they were diseases to be treated for removal. Now, in scientific works they are made respectably useful as pointing out distinctions between the true horses and the asses. And some naturalists have seized them to satisfy their craving for having vestigial hoof representations of the lost digits. This is a very alluring explanation. But we are told that "position is everything," and the positions of these are such that, to our mind, we must find some other explanation for them. At present the chestnuts are an unexplained mystery. What is their use—or analogy?

Digitized by Google

Cases of the absence of the spurs themselves are on record, an interesting fact to know.

The Passage of the Horse from the "New" to the "Old" World.—How, if this continent was the original home of the horse, was he able to become distributed in other countries of the so-called "old" world with the wide Atlantic between?

In his migration the horse kept his nose continually toward the western setting sun. He followed it into the day of his perfect completeness. There was only one way that he could do this, and science has pointed it out. It was during that distant time known as the miocene period, and the route was by what is now known as Behring Straits. At that time the connection between the two continents had not yet been entirely cut off. Then there existed what has since been called the miocene bridge between what we now call America and Asia. Over this rather precarious stepping-way the horses of those times passed and repassed to the latter continent. A time supervened, however, when the passage or bridge became submerged, sunk beneath the waters, was channeled out, forming the impassable straits of to-day. Thus the retreat of the horse was effectually cut off; and thus the "old" world became enriched at the expense of the "new." This phase of our history presents the exact parallel to the much later cutting off of Britain from the main land of Europe by the silver streak known as the English channel.

The remarkable part of the history is that in Asia and Europe the horse species (or the adventurous portion, in which was implanted the unconscious "germ" of evolution that developed itself into such splendid descendants of the early form) lived, while in America he became extinct. He left behind, it appears, his effete companions in which the force of continuation had become extinguished.

That this was the manner of transference of the horse to the old world, is supported from the similar evidence derived from a study of the remains of the musk-ox of the farther north. From such evidence it is clear that the musk-ox long ago roamed westward to Siberia and found its way eastward even to the British Isles. The musk-ox, though, became extinct in Europe and Asia, while the horse persisted. The reasons for this have yet to be furnished.

If the claims above stated as to the origin of the horse in America are true, we should expect to find, in the "old" world similar traces of early horse forms to those found in America. So we do. This part of the subject will, however, have to be dealt in Part II.

THE PACER IN THE TROTTING REGISTER.

BY J. T. L.

EDITOR OF THE MONTHLY:

Mr. Wilfred Page in the March number of the MONTHLY exhibits a spirit of fault-finding with the officers of the Trotting Register Association that is neither commendable in him nor just to those officers, who simply carried out what they understood to be the wishes of a majority at least of the stockholders of the association.

The American Trotting Register Association is not a close corporation, it is not a one-man-power affair, but every breeder in the country to the number of 1,500, the present number of shares of stock, can and is invited to become a stockholder in the Association and voice and vote for choice of rules, and for officers to carry out those rules, and the power lies in the hands of the stockholders only to see that the officers perform the duty for which they were elected. Under such circumstances it would have been more to the credit of Mr. Page and more interesting to the readers of the MONTHLY, if he had given his full reasons why the 2:25 pacer should not be registered under proper designation in the Trotting Register. If pacers having a record of 2:25 were recorded in a separate book marked "The Pacing Register," I understand from Mr. Page's article that such registration on part of the directors would be justifiable under the charter of the Association and the

Digitized by Google

authority of stockholders. It seems to me however, outside of convenience, that it is a matter of very little importance whether 2:25 pacers are registered with 2:30 trotters under their respective sires and properly designated or whether they are registered in a separate book, but it is a matter of the greatest importance whether 2:25 pacers shall by their performance confer standard rank upon animals that otherwise would not attain to standard registration.

Herein lies all that is of special importance to the great breeding public. They have no sympathy with, nor interest in, contributors or editors who indulge in petty quibbles, in technicalities, and personal fault-findings, nor in the disappointed aspirants for office or control, who, because they cannot rule, try to make the administration of others unpleasant, and succeed at least in annoying the reading public. What the breeding public want are facts that bear upon this great subject, and it will read with great interest all facts and deduction that each writer may draw therefrom so long as an advancing spirit toward light and knowledge guides the writers. There are two sides to every question, and no one man knows it all, hence the necessity for charity toward the opinions of others when honestly expressed, and the necessity that truth regarding breeding in whatever form and however it may conflict with preconceived ideas, be given to the public, that in the fullness of time there may be established a standard that everyone will approve.

At present the knowledge of breeding can not be called a science, it is largely experimental, and no one defined line carrying extreme trotting speed has been established. If one desires to breed 2:30 trotters, he will have no difficulty in finding strictly trotting-bred material to aid him in accomplishing his purpose, and with reasonable certainty of success, while to produce 2:10 trotters he would find greater difficulty; and to produce 2:05 trotters would to-day puzzle him, to say the least. There are breeders who look beyond 2:05, and are placing the limit at 2:00, and so long as the limit of trotting speed has not been determined and the desire is uppermost in the mind of progressive breeders to determine that limit, just so long will they use such material as nature has placed before them and which in their judgment will help them attain the desired end. It can not be denied that trotting horses carrying the highest rate of speed have been the product of a union between trotters and speed at another gait. Since such is the fact, and until the limit of trotting speed is determined, we can not expect breeders to limit their breeding to what are to-day called strictly trotting-bred, remembering that it is but a short time ago that the ancestors of the trotting horse of to-day were non-standard, and counted full of "running foolishness." They did not then talk so much about the "pacing foolishness."

The trotting horses of to-day that lead the world in speed were bred in the line of experiment, and our whole list of trotters would be to-day far behind the present rate of speed but for the introduction of blood other than trotting blood. Palo Alto, 2:08¾, was an experiment. Sunol, 2:08¼, was an experiment. Maud S., 2:08¾, was an experiment, and for a time was not highly valued, but later, by her unequaled performance, was crowned queen, which honor she held for many years, and still holds on a regulation track. The first-named was the produce of a union of trotting and thoroughbred, the second a union of two lines of trotting to one of thoroughbred, and the third a union of trotting, pacing and thoroughbred. The success of these experiments, the fastest trotting to date, will stimulate further research, and if the successful combination that trots in 2:00 includes the pacing blood, it will not be a matter of surprise when we remember the queen. Trotters relieved from weight have trotted close to 2:00, and the problem is, how can additional strength be given to carry weight and still maintain the flight of speed, or how can you increase the flight of speed, retaining present strength to carry the weight? There are three known gaits at speed. The fastest, running; the next fastest, pacing, while trotting stands third. Will a combination of these three in some form produce the ideal? The trotting register was formed, if I under-

Digitized by Google

stand it correctly, to establish a standard by which the trotting horse could be improved. It was not intended to anchor to a past nor to a present limit of speed and breeding, nor was it intended to place stumbling blocks in the way of progress, and all attempts to limit that register and cause it to do injustice to the trotting horse must fail of its purpose.

The present standard is not perfect, neither can a perfect standard be framed to-day, but whatever its imperfections, the recognition of the pacer therein is not one of them, rather is it the righting of a wrong that existed under the Wallace rules. If a thoroughbred running mare produced a 2:30 trotter, that mare, under the Wallace rules, was standard, and all her produce from a standard horse will be standard, however slow they may trot, pace or run. If a non-standard trotting bred and trotting mare, to the cover of a standard horse, produces a 2:25 pacer or better, why should she not have credit for the power to produce speed? In the first case the relatives of the 2:30 trotter, if they have not speed enough to take a record, are standard-bred trotters, while in the second case, though the pacer develops the speed of the wind, yet it is denied recognition under the Wallace rules. The wonderful two-year-old Arion, 2:10¾, had for a dam a mare that was made standard by the trotting performance of her relatives, and yet she could not trot at speed, but she could run like the wind, and to the cover of a controlling sire she produced the trotting wonder of 1891. Who can say, since the trotting horse Direct, 2:18¼, became the pacing wonder, 2:06, of 1891, that the controlling power of some sire may not, from a despised pacer, produce the wonder of all time.

When the extreme limit of trotting speed has been attained, then will it be time enough to talk of an exclusive trotting register and turn the back upon those elements that have so largely contributed to the production of extreme speed in the trotting horse. I have no love for the pacer as a pacer, and would gladly debar him from registration with trotters at any speed limit, and debar him from conferring standard rank by performance upon relatives who otherwise would be excluded from trotting registration, *if it could, with equal justice, be done, and the desired end accomplished*, but I am free to admit that I do not see how justice can be done the trotting horse by such exclusion, and I am sure gross injustice would be done the pacing horse bred in and from trotting lines, the accident of whose gait no one can account for. You can not discriminate between two members of the same family and do justice to either member, nor to the owner and breeder. If strictly trotting-bred sires and dams did not beget pacers; if a strictly trotting-bred horse did not trot one year, and the next year, in spite of all you could do (except shoeing), go to speed only at the pace; if shoeing did not change a trotter to a pacer, and a pacer to a trotter; if from the same strictly trotting-bred sire and dam there was not produced one year a colt that knew nothing but trot, and the next year a colt that knew nothing but pace; if it were not that the science of breeding has never yet been able to unravel the mystery of nature that surrounds the subject, then it seems to me we shall advance faster toward one ideal, *i. e.*, *extreme trotting speed and the establishment of a type of trotters capable of reproducing and sustaining that speed* by wisely using such means as nature has placed before us, and study how to control nature to continuously produce one ideal, without doing injustice to any member of the equine or human family.

PACING FACTS AND STATISTICS.

EDITOR MONTHLY:—There would be no use for argument if the two journals opposing the American Trotting Register had never any influence among the breeders, large and small, but such is not the case. The *Horseman*, in days past, has been one of the leading papers of the west, devoted to the interests of the breeders of saddle and light-harness horses. There has always been an attempt to issue a paper that would serve the interests of the breeders of thorough-

Digitized by Google

breds, and the news that belongs to that class of literature has always been conspicuous in the makeup of the paper. It suited many on account of this feature of its work, as some of our breeders also keep a jumper, yet do not feel like keeping up the expense of subscribing to the literature of both branches of the business. There is but one thing that the two antagonistic organs can agree upon, which is that the usefulness of the Register has been destroyed by the admission of the pacer on a basis of 2:25. One would think from the choice extracts of one journal copied into the other that with the advent of the American Trotting Register Company changes had been wrought that would change the whole purpose of the work. "There is now no Trotting Register," and such funny extracts are printed in one and copied in the other. I went over the last Year Book issued by Wallace, and I find there are *three hundred and fifty-five* sires of 2:30 pacers, and I find that of the *three hundred and fifty-five* sires *two hundred and eighty-five* are standard sires with a number attached, and this leaves only *seventy* sires of 2:30 pacers not already admitted by the trotting performance of their get. Of the *seventy* only *forty* of them have ever sired 2:25 performers, and many of these that have sired 2:25 and better performers have not and can not comply with the other requirements of the standard. So that of the sires of 2:30 pacers at the close of 1890 only about thirty of the sires then represented are likely to be brought into the standard by this change of the rules. We are numbering now nearly two thousand standard trotting sires, and of these, thirty-six that I have followed are strictly pacing-bred, and had entered the register on the merits of their trotting produce. No warning or note of alarm was sounded, although we have two thoroughbreds numbered as standard trotting sires and thirty-six pacers and pacing-bred sires had, with their families, gained admission to the trotting standard. Now, when on a speed basis five seconds faster a door is opened that may admit thirty more, with their families, a virtuous cry of indignation arises in the select circle of the rejected *National Association of Trotting Horse Breeders*, and is echoed by the would-be registrars at Chicago and Cleveland. I have named three elements disgruntled and dissatisfied, but in the last number of the MONTHLY came a surprise, the letter of Mr. Wilfred Page, "A House Divided Against Itself Must Fall." If Mr. Page is speaking his true sentiments and has studied the records as much as he seems to have done the proceedings of the Chicago convention, he should sell his stock and register in the great moral "What is it" presided over by Mr. Mali and run by Mr. Packer and solicited for by Mr. McLeod, of Chicago, and Mr. Gocher, of Cleveland. These are *honorable* gentlemen, and have no axes to grind, and will make the great moral "What is it" a success if it does reduce the work of mailing clerks of their respective homes. Mr. Page is in the wrong camp or misunderstands the situation. Since the compilation of the first volume of the Wallace or American Trotting Register every addition to the blood of the recognized trotting families has come from the pacer. In the early part of the last half of the present century the families of the Clays or Bashaws and the Vermont Black Hawks were in the ascendancy. Mambrino Chief was a six-year-old, and Hambletonian was a yearling. Pelham, a pacer, and the wonderful gray mare, Lady Suffolk, an inbred Messenger, had on the same afternoon trotted in 2:28¼.

Three years later the gray gelding, Hero, by Harris Hambletonian, paced in 2:20½, and one year later the dun gelding, Ben Higdon, paced in 2:27, and the next year the pacing-bred pacer, Pocahontas, electrified the world by pacing to wagon in 2:17½, carrying Tom Rolf, at that time showing plainly the higher rate of speed and greater endurance of the pacer over the aristocratic diagonal traveler, which has been and is up to the present time upheld by all classes from yearlings to aged horses. Smuggler, a converted pacer, held the stallion record for eight years. Blue Bull, a pacer, for four years, held first place as a sire of 2:30 trotters, and yet holds it, and always will, for the longest list of 2:30 trotters from untraced dams. Up to the last day of 1890, thirty-six pacing-bred stallions

Digitized by Google

had made a place for themselves and earned the required trade-mark, a standard number, and no one was injured and no one sounded a note of alarm, but there were still thirty outside whose usefulness was curtailed because they had not yet acquired the trade-mark, but the new management or the convention or their committee saw the advantage of admitting this handful of sires, if only they sired extreme pacing speed.

The howl comes from California, Illinois, Ohio and New York, these thirty sires that may possibly be admitted will destroy the work of the twenty thousand already admitted, although quite a number of those already in are of the same cosmopolitan construction as the possible new comers. If they would put it in this way it would do no harm, but no, the 2:25 pacer has been admitted. The bars were let down by the new Association. *They were down when the trotters were admitted on a 2:30 basis*, as no pacer that sires speed at either gait, but will sire 2:30 trotters, and several that were out of the standard in 1890, would now have to be admitted by having sired more than one 2:30 trotter. The worst that I see from the admission of the pacer comes from such sires as Clinker, 2:20, and Cohannet, 2:17½, to unite with the blood of Epaulet, Simmons, Alcryon, Barney Wilkes, Lyle Wilkes, Cheyenne and Wilkes Boy, and thus establish a family of flyers and race winners who will never enjoy seeing their own victories, with sightless orbs they amble back to their stalls victors, but the poise of the head and the activity of the ears show to an appreciative looker-on that the poor horse, through the cupidity of man, was brought into this world a poor dumb brute, who must rely on his driver to save him from accidents and collisions, from fences and ditches If we must take the numbers away from those already in, let's raise a race of sound horses, and expunge from our books the sires that are lame and halt and blind. I may be an interested writer, as S. T. H. intimates. *Justice may be as thin as water*, as Mr. Gocher says, but I am a better friend to the American trotter than the one who would crowd out the sound enduring pacer to give place to a blind phenomenon. Some will say you are injuring private property, or the business of your neighbor. It is like injuring the business of the burglar or thief. Hundreds of colts in fashionable lines are sold every year to purchasers, who would not buy if they had known the sire or dam was blind, and when the purchase goes blind, this man who is not able to own a blind horse can not account for the blindness of a colt as well treated as he knows his has been. L. E. CLEMENT.

The Trotting Instinct.

TO THE EDITOR OF THE MONTHLY:

JUST now we are hearing a great deal about the *instinct* to trot fast—that is, being bred into colts—and the claim is made that if we breed mares with fast records to horses with fast records we will ultimately have colts that will know no other gait than the trot, and that that will be their fastest gait.

They quote the old axiom of "like producing like," and further fortify their position by claiming that a long continued system of training for a special purpose will eventually result in an *instinct* to do naturally that for which they have been trained, and instance the pointer and setter dogs as proof of their claim.

Were this true, the problem of breeding the trotter would be solved, and the production of the 2:30, 2:20 or even the 2:10 trotters would be a matter of time and some money. I do not wish to draw upon my humble head the wrath, scorn and sneers of all the eminent *breeders* that are now editors of turf journals (for I take it for granted that they must be breeders, as they know all about the breeding problem, and have it on tap at from two to four dollars per annum) by saying that I do not believe there is one word of truth in the claim, and that there is not one particle of proof to sustain it. But I must say now, that *instinct* does not now, or will it ever play any part in trotting *speed*.

I understand instinct to be that attribute or faculty implanted by nature in all animals to do certain things requisite to sustain and protect *life* voluntarily. The foal just dropped will instinctively struggle to stand upon its feet, and that attained will instinctively nose around its

Digitized by Google

dam until it finds the food that nature provided the dam with for its use. At maturity it walks around feeding, and will not trot or jog off leisurely to its companions; but if *danger* threatens will *flee* at its fastest gait, which is the run.

Nature has so constructed the horse, and, in fact, most of the quadrupeds, that the run is naturally their fastest gait. And when *instinct* plays any part in speed it is when the animal instinctively flees from danger, and then they always run.

That a long system of training for a special purpose has any effect upon the progeny, is a very nice *theory* for *theorists*, but it is not borne out by facts or experience. Man has trained animals for hundreds of years for special purposes, and while the individual, as the result of such training and from habit, will do many unnatural things and least to be looked for, yet they have never transmitted either their training or acquired habits to their offspring. We are just as careful, and perhaps more so now, in breaking our colts to harness and to drive as they were hundreds of years ago. If there is anything more than a *theory* in the *theory*, they ought to be instinctively broken so that at a proper age you could harness and drive them without any previous handling.

A very plausible, and for that reason dangerous to the unthinking, is the theory that pointer and setter dogs point game birds as the result of a long line of well-broken and trained dogs for that pur pose.

It is dangerous to accept the theory because pups at three or four months (and I have seen them even younger) find and point game birds unassisted, but is it the result of ancestral education, or a *natural* instinct. Dogs are better understood and appreciated more by universal man than any other of our domestic animals. We understand him better, and he appears to understand us better. Certain it is that dogs both of low and high degree understand our language to a considerable extent, and for that reason are susceptible of a higher degree of education than any other of the domestic animals. It will not be necessary for me for the purpose in hand to go back to the original breed of dogs and the different families into which they were divided, in fact it is only conjecture; we have as good knowledge of the existence of dogs as the friend and companion of man as we have of man himself, but it is enough to say that there are several different families, each with its own peculiar natural attribute or instinct implanted by nature for the purpose of enabling them to capture their prey for sustenance. The game birds of the field are the natural prey for the setter or pointer, the rat for the terrier, the hare for the greyhound, the deer for the staghound, etc. Man has made use of the natural instinct of the different breeds, and by *education* has curbed that instinct for the purpose of complying to rules governing sport. Thus the terrier is educated to kill the rat with one snap, not worry it afterward; greyhounds to catch and kill hares, but not devour them. In the case of the pointer and setter nature has endowed them with a very fine and sensitive nose. So delicate is that organ that they can readily detect the different species of birds, and by a stealthy approach, not making the least noise and always to the leeward, at last to spring upon, capture and devour their prey. Now, what has man done to develop that instinct? Absolutely nothing. He has only by a system of training curbed the natural instinct so as to have the dog stop short of his spring, and not chase after the bird flushes; and that training has to be repeated with each individual. I have yet to see the first dog that would drop to wing or shot, or retrieve untrained. They point their game, for it is their instinct implanted by nature; the rest is education or training, and is not transmittible, although they may be descended from a long line of dogs on both sides of the house so educated.

"Like produces like," *invariably* only so far as *species* is concerned, and in slightly less positive degree anatomical structure (or the likeness of an ancestor), courage, nervous temperament, disposition and form are, as a rule, transmittible to immediate progeny, in some particular after the sire, in others after the dam, and again a happy medium of the excellencies of both, or it may be their

Digitized by Google

defects. Trotting at a speed greater than intended by nature (an intermediate or leisurely gait) is the result of anatomical structure and education. No amount of education will make a 2:20 horse out of a Percheron or Clydesdale, structure prevents it, but the 2:20 horse can not pull the load of the Percheron or make as reliable a workhorse as the Clydesdale. Disposition, nervous temperament and lack of massive structure are in the way. To my mind anatomical structure, courage, disposition, nervous temperament and form are indispensable in the production of the fast trotter, and those are the most positively transmitted and is not instinct in any form. I do not believe in training fillies that are intended for brood-mares any further than to demonstrate that they are susceptible of training to a fast record, or, for that matter, colts either, if intended for the stud. Harold, sire of "Maud S.," nor any of his sires had any speed at the trot that we know of; Miss Russell, her dam, but very little, and the balance of the female line none; Pilot Jr., sire of Miss Russell, only a little, and his ancestry none, yet Maud S. was queen for years, and only dethroned this last fall by a mare that has the same ancestral history, as far as developed speed is concerned. Not a trotting record in the lot, yet behold the queen, 2:08¼, and with no long line of trotting records to establish, nurse and maintain a trotting *instinct*.

Chicago, Ill. M. W. BONFIELD.

Cecilia Clark's Pedigree.

IN Vol. II, page 148 of Wallace's A. T. R., the following pedigree is registered, viz.: "Cecilia Clark, b m foaled 1870, by Clark Chief; dam by Capt. Beard; g dam by imp. Envoy; g g dam by imp. Tranby. Bred by James M. Wood, Franklin county, Ky." This is correct as far as it goes, but as there are at least two different lines of similar breeding, this record is not sufficiently explicit to identify the particular line to which Cecilia Clark belongs, and should be changed to read thus:

"Dam, chestnut mare (bred and owned by James M. Wood), by Capt. Beard; g dam, chestnut mare, foaled 1847 (purchased from executor of D. C. Overton, by James M. Wood in 1856), by imp. Envoy; g g dam, Mary (sister to Vandal's dam), by imp. Tranby; g g g dam, Lucilla, [See Bruce's stud book.] by Trumpator."

Several catalogues, amongst them, those of Palo Alto, Claireview Stock farm, and Robert Steele give this breeding erroneously, making the third dam the dam of American Clay (as per version, marked "II"), and as neither the Stud Book nor the American Trotting Register furnishes enough facts to decide which version is correct, the two were submitted through Mr. Brodhead, to Mr. James M Wood, of Wood Lake, Franklin county, Ky., as follows, for his decision, viz:

I.	II.
Cecilia Clark, by Clark Chief.	Cecilia Clark, by Clark Chief.
Dam, by Capt. Beard.	Dam, by Capt. Beard.
2d dam, by Imp. Envoy.	2d dam, dam of Gen. Hatch. by Imp. Envoy.
3d dam, Mary (sister to Vandal's dam), by Imp. Tranby.	3d dam, dam of American Clay, by Imp. Tranby.
4th dam, Lucilla, by Trumpator.	4th dam, by Aratus.

Under date of March 15, 1892, Mr. Wood writes as follows: "By reference to my book for the year 1869, I find this entry, viz.: 'Bred ch m by Capt. Beard, out of the Envoy mare, to Clarke Chief,' (by Mambrino Chief), April 22, 1869, and bred again May 1, 1869. Foaled bay filly, with star and two hind feet white, (filly large and fine), Wednesday, March 30, 1870.

"I purchased during the year 1856, from the executor of D. C. Overton, deceased, in Fayette county, Ky., the bay mare, Lucilla, by Trumpator, then seventeen years old, and the chestnut mare by imp. Envoy, then nine years old, and owned both of the mares when they died.

"The chestnut mare by imp. Envoy was out of Mary, by imp. Tranby (own sister of the dam of Vandal); second dam Lucilla, by Trumpator; third dam Lucy, by orphan, etc. The chestnut mare by Capt. Beard, out of the Envoy mare, was bred and owned by me, and died upon my place.

"The bay mare by imp. Tranby (the dam of American Clay) was purchased by me from Hector Lewis, of Fayette County, Ky., during the year 1856, and was owned by me when she died.

Digitized by Google

"American Clay was bred by me. His dam was by imp. Tranby, second dam, by Aratus, third dam by Columbus, etc. While the dam of American Clay *was* by imp. Tranby, and the third dam in Cecilia Clark's pedigree is also by imp. Tranby, yet the dam of one mare is by Aratus, and the other, Lucilla, by Trumpator—quite different."

This letter clearly establishes the correctness of version "I," and the inaccuracy of version "II," although it is easy to see how the two have been confused. Your publication of this will set the matter right, and prevent the error from spreading.

A. J. MESTON.

ALLEN FARM, PITTSVILLE, Mass.
March 19, 1892.

[The correction will appear in Vol. XI of the Register—Ed.]

A horse can live twenty-five days without solid food, merely drinking water, seventeen days without eating or drinking, and only five days when eating solid food without drinking. An idea prevails among horsemen that a horse should never be watered oftener than three times a day, or in twenty-four hours. This is not only a mistaken idea, but a brutal practice. A horse's stomach is extremely sensitive and will suffer under the least interference, causing a feverish condition. feeding a horse principally on grain and driving it five hours without water is like giving a man salt mackerel for dinner and not allowing him to drink before supper time—very unsatisfactory for the man. If you know anything about the care of horses and have any sympathy for them, water them as often as they want to drink—once an hour if possible. By doing this you will not only be merciful to your animals, but you will be a benefactor to yourself, as they will do more work, they look better and live longer. If you are a skeptic, and know more about horses than anyone else, you are positive that the foregoing is wrong, because you have had horses die with watering them too much, and boldly say that the agitators of frequent watering are fools in your estimation, and you would not do such a thing. Just reason for a moment and figure out whether the animal would have over-drunk and over-chilled his stomach if he had not been allowed to become over-thirsty. A horse is a great deal like a man. Let him get over-worked, over-starved or abused, and particularly for the want of sufficient drink in warm weather, and the consequences will always be injurious. Sensible hostlers in large cities are awakening to the advantage of frequent watering. Street-car horses are watered every hour, and sometimes oftener, while they are at work. It is plenty of water that supplies evaporation or perspiration, and keeps down the temperature. What old-fogy methods amount to may be seen by the change in medical practice to man. Twenty years ago a person having a fever of any kind or pneumonia was allowed but little water to drink, and then it had to be tepid. To-day practitioners prescribe all the iced water the patient can possibly drink, and in addition cold bandages are applied to reduce and control the temperature of the blood. What is applicable to man will never injure a horse. Use common sense and human feeling. Don't think it is a horse, and capable of enduring any and all things. A driver who sits in his wagon and lashes his worn-out, half-curried, half-fed and half-watered team should never complain of any abuse he may receive from his master or employer, for he is lower in character, harder in sympathy and less noble than the brutes he is driving, and deserves, in the name of all that is human, the same punishment of a criminal.

A wealthy gentleman had made up his mind that he must own a fast horse, so he went to a prominent dealer in a large city, who took him into his stable and showed him a number of horses with records from 2:30 to 2:40, and graphically told the wonderful races they had won. The gentleman did not enthuse on these, so he led the way to another stable and showed some colts that were sired by gilt-edged stallions of distinguished families. and after commenting on their good qualities, which was attentively listened to, the would-be purchaser turned to the proprietor and said, "Well, I have seen all of your 'have beens' and all of your 'will bes,' but what I want is an 'is'er.'"—*Ex.*

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, APRIL, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00
All in one order..... 35.00

The Sires of Ten or More.

IN these days when young stallions are making reputations as phenomenal sires of speed, exhibiting in their sphere as much precocity as do the baby trotters of the turf, it is nothing like as easy to class trotting sires as it used to be. Up to within a comparatively short time the merits of a stallion, so far as his being a sire of speed was concerned, were determined solely by the number of his get that had entered the 2:30 list as trotters or pacers. In those days precociousness in a sire was practically unknown, and if a stallion had a representative in the 2:30 list by the time he was close to a dozen years old he was considered to be doing very well indeed. But now all this is changed, and the stallion that is not at the age of ten years—having been given a fair opportunity in the stud—able to demonstrate his capacity as a sire of speed, is deemed a little behind the age, and it is no uncommon event for a stallion that is only seven or eight years old to have sired standard speed at the trot or pace.

For this reason it will not do, in considering the respective merits of trotting sires, to be guided entirely by the number of their get in the 2:30 list, and yet, as a general proposition, no better one to follow can be found. It is not so many years ago that the list of stallions that had ten or more of their get in the 2:30 list was not a very long one, but examination of the records up to the close of 1891 develops the fact that in this category there are now ninety-six stallions, some of them, as will be shown later on, being so young that their success is absolutely startling. The list is as follows:

Young Wilkes	1868	13	2:26

The first thing naturally to be considered in connection with these ninety-six stallions that have risen above the common in the matter of siring standard speed at the trot and pace is, How are they bred? A casual glance at the list shows a remarkable preponderance of the blood of Rysdyk's Hambletonian, so far as the male line is concerned, and careful perusal of the names develops the fact that, outside of Hambletonian himself, sixty-four of the horses mentioned above are descended directly from him, as follows:

Sons of Hambletonian	24
Grandsons of Hambletonian	27
Great-grandsons of Hambletonian	11
Great-great-grandsons of Hambletonian	2

This is exactly two-thirds of the whole number of stallions that have sired ten or more 2:30 or better standard performers, and although the superiority of this strain of blood in the production of trotting and pacing speed is universally conceded a direct statement of this sort, compiled from the official records, is worth yards of argument. There is also information of a valuable and interesting sort to be obtained by an analysis of the breeding of these stallions in the female line. In this particular the tried and tested blood of Mambrino Chief shows up grandly, that horse having sired the dams of nine of the stallions in the list, while his most prepotent son, Mambrino Patchen, is represented by four. The stallions that have sired the dams of two or more horses in the above list are:

Mambrino Chief	9
Seely's American Star	7
Mambrino Patchen	4
Pilot Jr.	4
Alexander's Abdallah	4
Rysdyk's Hambletonian	3
Abdallah	3
Harry Clay	3
Volunteer	3
Edwin Forrest	2
Woodford	2

When it comes to the question of the average rate of speed in those of their get that have beaten 2:30, the pursuit of knowledge becomes absolutely fascinating to one who is interested in blood lines and has made somewhat of a study of them. For instance, taking 2:23 as the standard, it is found that only ten of the ninety-six horses in the above list are eligible, and unquestionably the best of these, all things considered, are Guy Wilkes and Sidney, while right after them comes Director, it being a curious and perhaps a significant fact, that all three of these phenomenal young sires are owned in California, and have passed most of their lives there. The horses with ten or more representatives in the 2:30 list, whose get have in point of record averaged 2:23 or better are:

Name.	Foaled.	Sire.	Av. Rec. of get.
Guy Wilkes	1879	Geo. Wilkes	2:21
Sidney	1881	Santa Claus	2:21½
Mambrino King	1872	Mambrino Patchen	2:22
Director	1877	Dictator	2:22
Pocahontas Boy	1865	Tom Rolfe	2:22½
Hamlin's Almont	1872	Almont	2:22¾
Alcyone	1877	Geo. Wilkes	2:22¾
Pancoast	1877	Woodford Mambrino	2:22¾
Gambetta Wilkes	1881	Geo. Wilkes	2:23
Kentucky Prince	1870	Clark Chief	2:23

Guy Wilkes, Sidney and Director, who, when age is taken into account, must be admitted to outrank the others in this list of ten, were foaled, respectively, in 1879, 1881 and 1877. In the matter of siring trotting speed as opposed to that of the pace, Guy Wilkes and Sidney are on a par, each having put ten in the list, but Sidney has no less than eight pacers, some of them cracks, like Fausta, the yearling champion at the gait; Gold Leaf, 2:11¼; Adonis, 2:11½; while Rupee, the fastest pacer by Guy Wilkes, is credited with 2:14¾. Foaled two years later than Guy Wilkes, his nearest competitor among the great sires of the century, Sidney equals him in number of trotters, and

Digitized by Google

far outranks him as to pacing speed. The ten trotters by Guy Wilkes average 2:21¾, while the average of the ten by Sidney is exactly two seconds slower. But in pacing speed Sidney fairly outclasses Guy Wilkes, his eight sidewheelers in the 2:30 list having an average record of 2:17½, with a yearling among them at that, while the two pacers sired by Guy Wilkes average 2:16¼. In his day Guy Wilkes has had a three-year-old champion in Sable Wilkes, and a king among two-year-old stallions in Regal Wilkes; but to offset this Sidney puts forward the champion yearling trotter of to-day in Frou Frou, 2:25¼, and the best yearling pacer in Fausta, 2:22¾. Director is also prominent among sires of champions, as he has to his credit the pacer Direct, that holds the world's record, 2:06, at that way of going, and on two occasions has lowered the pacing race record for three consecutive heats. With Direct and his champion all-age record for pacers in his list, Director's eleven trotters and one pacer average 2:22, or not quite as fast as the get of either Guy Wilkes or Sidney, while with Direct out, the discrepancy between Director and the other two California sires who figure in the select list of ten would be still greater.

It is a noticeable fact, by the way, that of this list of ten stallions, the average record of whose progeny is 2:23 or better, no less than three are by George Wilkes, a trotter with a record of 2:22, they being Guy Wilkes, Alcyone and Gambetta Wilkes. Sidney is by Santa Claus, also a developed sire, as his record of 2:17½ amply proves, and Pancoast is by Woodford Mambrino, 2:21½; Mambrino King is by Mambrino Patchen, brother to the 2:18¼ trotter, Lady Thorne; Director is by Dictator, brother to the 2:17¼ trotter, Dexter; Pocahontas Boy is by Tom Rolfe, 2:33½; Hamlin's Almont, by Almont, 2:39¾, and capable of a much higher rate of speed, while Kentucky Prince is by Clark Chief, an undeveloped stallion.

Taking these ten horses and considering them from the point of developed speed as applied to themselves, we find that Guy Wilkes has a record of 2:15¼; Sidney one of 2:19¾ (pacing); Director one of 2:17; Pocahontas Boy one of 2:31; Hamlin's Almont one of 2:26; Alcyone one of 2:27; Pancoast one of 2:21¾; Gambetta Wilkes one of 2:26, while Mambrino King is commonly understood to have trotted a trial in 2:26, and Kentucky Prince was driven a half mile as a three-year-old in 1:11½ for the benefit of Col. John W. Conley and Mr. G. H. Brasfield, who went to the farm of his owner to see the colt, the performance taking place over a poor half-mile ring with the stallion in no condition for that sort of work. It therefore appears that every stallion with ten or more representatives in the 2:30 list, the average record of whose get is 2:23 or better, has a record of 2:30 or better, or has publicly demonstrated the ability to step a mile in the time indicated by those figures, while three of them have records better than 2:20. The average record of the eight stallions in this list with records is 2:24, and the other two showed in public that they could beat 2:30 four or five seconds. This showing, which is a simple presentation of cold facts from the record books, and not the rosy imaginings of a fervid enthusiasm, is one of great significance in these days, when people are naturally anxious for some definite information as to what the developed sires are accomplishing in comparison with stallions who have no place in the record books or authenticated trials at a 2:30 or better rate of speed. This select list of ten stallions contains a horse—Pocahontas Boy—that was foaled as far back as 1865, and another—Sidney—whose natal day came in 1881. A majority of the horses, however, would come under the head of young sires, that is, young to have ten or more in the 2:30 list, and this is also a fact affording instruction and food for thought to breeders, inasmuch as it demonstrates in the clearest possible manner the giant strides that have of late been made in breeding up the American trotting horse to a point where definite results in the way of siring speed are expected and demanded of a stallion while he is yet young in years, especially if by his breeding or performance on the turf his services have been sought for by the public, or he has been mated with so exceptionally a good class of mares by his owner as to draw attention to his work in the stud.

Training Horses by Swimming.

JAMES GOLDEN, an eastern driver of trotters who is a thoughtful man as well as a successful one in his business, recently said to the representative of a Boston paper that within a few years the methods of training trotters would be very much changed, it being his idea that in the future horses would be given less track work. He instanced the fact that trotters frequently would go extra good races after being shipped some distance in the cars, it being

argued that the motion of the train and the alertness on the part of the horse necessary to enable him to keep his feet brings into play nearly all the muscles of the body without calling upon any of them for so great an effort as to produce fatigue, and after stating this Golden puts forward the idea that possibly some sort of a machine will be invented for giving horses exercise without subjecting them to the severe tax on bones and muscles which inevitably accompanies a preparation under orthodox conditions. He also refers to the fact that horses have been trained by swimming them. This idea is being exploited a good deal just now in various parts of the country, no doubt in a great measure owing to the fact that a California breeder has constructed on his farm a ninety-foot tank for the purpose of swimming horses.

When it comes to a question of how to fit trotters for races, no matter what the conditions are, there is no better authority than Budd Doble, and hearing that a good many years ago he tried the experiment of training Hotspur, 2:24½, by giving him swimming exercise instead of working him in the ordinary manner on a track, Mr. Doble was seen and questioned. Said he: "Yes, it is true that one season I trained Hotspur altogether by swimming him. It was in 1871, at which time I had my horses on the old Fashion track, Long Island. In those days Buffalo was about the only place where a big trotting meeting was given, there being no circuit, and the entries to the principal events at Buffalo closed a long time before the time set to trot them. The year I speak of there was a purse of $6,000 to be trotted August 10, and to this race Hotspur being eligible, was entered. As soon as I began to work him I discovered that he had a bad hind leg which filled up very quickly and although I at once ceased training operations and gave the horse a rest I found that as soon as he was started up again the trouble came back, and I saw that there was no chance at all to get him ready for the Buffalo race if he was to be worked in the ordinary manner.

"It then occurred to me that perhaps it would be possible to get him in shape by swimming. I thought the matter over and remembered that when I was a boy swimming was pretty hard work if we wanted to see how fast we could go and keep it up for any considerable length of time. Hotspur was a hardy little horse and I resolved to try the experiment as it could not do any harm, there being no other way to shape him up. So I started in to swim him about two or three times a week in Long Island Sound. On the days when he was to be worked we would go to the beach with all our blankets, hoods and scrapers, just as though the horse was to be given fast work on the track. I hired a man who had a boat and he would do the navigating while I stayed in the stern of the craft and watched Hotspur swim along behind. I would swim him a quarter of a mile at a time and would perhaps give him two or three heats in this way, taking him ashore at the close of each one when we would get the water out of his hide, cover him with blankets and walk him, the result being that he would break out into a sweat and get a good scrape. We worked along in this way until nearly time for the race, the horse not once during that time being taken to a track; he was shipped to Buffalo and two days before the race I gave him a slow mile, that being all the work he had on land before trotting for the $6,000 purse. To show you that he was in pretty good condition from his swimming exercises I may say that Hotspur won the Buffalo event, and it was a five-heat affair at that, the first heat being dead with Byron in 2:25½, after which Myron Perry won the second in 2:25. The third fell to Hotspur, the time not being given on the books, as I see by referring to them, but he won the fourth and fifth heats in 2:25½, 2:25, which last mile was within a second of the best record he ever made.

"Now do not understand me to say," continued Doble, "that I advise swimming horses as a good thing under all circumstances, because it is my opinion, based on experience, that in some cases the effect of swimming exercise instead of training on land would be to weaken a horse, so that if it were kept up a sufficient length of time he would retrograde instead of gain in both speed and staying ability. I rembember that when Oliver K., 2:16¼, was in my stable I tried the swimming plan on him at Detroit, and am satisfied that it weakened him."

The Thoroughbred Cross.

THERE has arisen in the East a discussion between "Aurelius," a well known writer on breeding topics, and "Vision," the last named party being a fervid apostle of the theory that whenever unusual speed at the trot is found

Digitized by Google

in a horse such fact is evidence that some thoroughbred ancestor of the animal is responsible therefor. It was in the line of disseminating this theory that "Vision" constructed an elaborate article for an eastern paper which argues that Nancy Hanks trots because of the Diomed blood in her veins, his contention being that the only descendants of Flora Temple, the first mare to beat 2:20, that had shown speed at the trot were those coming through a mare known as The Queen's Daughter, the product of mating Flora Temple with the thoroughbred stallion Leamington, a horse that after proving his merit on the English turf in the most conclusive manner by winning great races was brought to this country, where he founded a family of winners.

If there was any virtue in the idea that the blood of the thoroughbred and that of the trotter could be blended with general success, the breeding of Flora Temple, the greatest trotter of her day, to the successful racehorse and sire Leamington was certainly in the line of its demonstration. But as a matter of fact The Queen's Daughter was no trotter, and her descendants have never amounted to anything in that line. The fact that in the entire history of breeding the trotter one stallion, and one only, has been able to get any considerable amount of standard speed when mated with thoroughbred mares, is the best evidence that the scheme is not one that can with profit be followed by the ordinary breeder. Electioneer controlled the action of his foals from thoroughbred mares, just as he did that of foals from pacing mares, but there was never such another prepotent trotting stallion in the world as Electioneer, and in the matter of controlling the gait of his progeny it may well be doubted if his equal will soon again be seen, although as to siring 2:30 speed he is likely to be succeeded by some other stallion in the next five years. The few people who are clinging to the idea that the pedigree of a colt that is wanted for a trotter can be improved by liberal infusions of thoroughblood close up are not making any headway just now.

The trotters, with few exceptions, that win the money on the turf every season are trotting-bred, and the stallions that command patronage at the highest fees are those with fast records, which means that men who are willing to pay liberally for the services of a stallion believe that the surest way to get trotting speed is to breed to a horse that has a little of that article on tap himself. These men naturally are unable to see how a horse can impart something he does not possess, or, in other words, how a horse that is incapable of trotting is likely to get trotters. To argue that blood lines will make up for lack of speed will not do, because all that makes any set of blood lines valuable is the fact that some horse or horses carrying them have trotted fast. In other words, the performances are what make the blood lines, and it is only after a performance is on the books by a horse of any particular breeding that it is possible to argue that those blood lines are valuable. This view of the case has been borne home very forcibly during the last few years to men in all parts of the country who have bought horses on blood lines alone, in many instances paying, on account of their breeding, long prices for animals that were old enough to demonstrate whether or not they could trot and that did not show speed. The time for sales of that character has gone for good. It has been demonstrated by a yearling trotting in 2:25¼, a two-year old in 2:10¾, and a three-year-old in 2:10½ that, as with the thoroughbreds, trotters can be brought to at least an approximate measure of their speed at an early age, and with this fact demonstrated stakes for young trotters have followed, until at the present time it is these young trotters—those that used to be called babies—that can be heavily engaged, and not the old campaigners. There is to be no more waiting until a trotter is five or six years old before a start in a race is made, with attendant expenditure in training bills, in many instances, of five times what the animal is worth. In these times a man discovers by the time his trotting-bred colt is three years old whether or not it is a trotter, and if the verdict is against the youngster there is neither money nor pleasure in playing the game any further, because demonstrated merit is the only quality that will bring the money, either on the track or in the sale ring.

A Fraud Exposed.

GEORGE J. REIGER, of Midland, Tex., who is one of the proprietors of the Thornhill Stock Farm has been indulging in some practices regarding the registration and sale of stock that entitle him to be branded as a man of whom all reputable people should steer clear.

The story is a simple one. On the 18th of February the Registrar of the American Trot-

Digitized by Google

ting Register Association was applied to by Mr. Reiger, who desired to have six animals named respectively, Annie Ray, Lulu Gray, Annie Norwood, Hannah H., Tulo Rosa and Queen of Savannah, registered. Forms that had been filled out were sent on, but a casual investigation of these demonstrated the fact that it was not possible to register the animals as standard, and they were therefore, accepted as non-standard only, and certificates to that effect forwarded.

This application came from Savannah, Ga., and the certificates were forwarded to Reiger at that place, nothing more being thought of the matter until March 7, when the following telegram was received from Mr. E. C. Gleason:

SAVANNAH, GA., March 7th.

J. H. STEINER, American Register Association:

Is Lulu Gray, 4043, standard? Have bought her as such. Think certificate has been tampered with. Wire answer. E. C. GLEASON.

It should be noted here that the number after the name of Lulu Gray refers to the non-standard certificate that was sent to Reiger in regard to the mare. Registrar Steiner at once entered into correspondence with Mr. Gleason, asking that the certificate be sent to this office, and in course of time the following letter arrived:

SAVANNAH, GA., March 7th.

J. H. STEINER,

Dear Sir—I telegraphed you this morning in regard to the filly Lulu Gray, as per certificate, which I purchased with some others as standard-bred at public sale here on February 25th, held by George Reiger, of Midland, Tex. As my telegram says, I thought the certificate had been tampered with, the word "non" being erased.

The same was the case with the filly Annie Ray, formerly Maggie Mitchell, purchased by Mr. W. H. Ray. I surrendered my certificate to Mr. Reiger, but Mr. Ray still holds his of Annie Ray, which I can forward to you if you desire. I desire your attention to this matter, as it of great importance to the public generally. As for myself, I feel in no way satisfied and will refer you to any bank in this city, or other commercial agency as to my standing. Yours truly,

E. C. GLEASON.

The certificate shows indisputable evidence of alteration, and very clumsy work at that. It has been the custom of the Register office in the case of non-standard animals to simply use a standard certificate, marking out with ink the words "standard under rule —," and stamping in place of them the words "Non-standard." In the case of the filly Annie Ray, the certificate as issued to Reiger read: "This is to certify that Annie Ray has been duly registered as non-standard in volume XI, of the American Trotting Register." Then followed the pedigree of the mare, thus: "Annie Ray, b m foaled 1890; by Vivesse 10579; dam Daisy Wood, pedigree not traced," etc. Curiously enough it happened that where the mare's name was given there was left on the line below it, a blank space and in this space after the name "Daisy Wood" was inserted "by Capoul 2:28, g d," so that after the pedigree had been altered, instead of Annie Ray being from a dam whose pedigree was unknown, the certificate read, "Dam Daisy Wood, by Capoul 2:28, g d pedigree not traced." A more clumsy or apparent alteration could not be imagined, there not being even a resemblance in the ink used by the person who made the alteration to that which was employed in the office when the certificate was made out. On the back of the certificate in the place left for transfers, it is stated under date of February 25, 1892, that Annie Ray was sold to W. H. Ray, of Savannah, Ga., and this transfer memorandum is signed "Reiger & Dunn," all this being in the handwriting of Mr. Reiger, as evidenced by the comparison of it with the chirography of a letter from him received at this office, and also further proven by reference to the blanks filled out by him when the animals were first offered for registration. On the 10th day of March a telegram was received from Reiger as follows:

COLUMBIA, S. C., March 10th.

J. H. STEINER:

See letter about certificate of Lulu Gray, Annie Ray, Hannah H.

GEORGE J. REIGER.

When this letter arrived it was found to be simply a mass of assertions to the effect that the animals were not sold as standard-bred, but simply as being registered. No attempt is made to explain this alteration of the non-standard certificate into a standard one, and the letter in no way helps Mr. Reiger's case.

But another letter was also received about the time that Mr. Reiger's arrived. It is an interesting epistle, and shows that the Savannah episode was not the first one in which Reiger had figured in an unenviable light. This letter is as follows:

LINCOLN, ILL., March 19, 1892.

JOHN H. STEINER, Esq., Chicago, Ill.

Dear Sir—The enclosed letter written to our mutual friend of this place, has been handed to me with a request that I should answer it and give the particulars of what is known here of George J. Reiger or the firm of Reiger & Dunn.

In the year of 1890, Reiger, under the name of L. Rei-

Digitized by Google

ger, shipped to Lincoln about thirty colts, claiming to have shipped them from his farm in Kansas. He advertised the colts for sale as standard-bred and to have been sired by Rushville, Vivesse, McGregor and others. On the day of the sale he stated publicly that all these colts were registered in Wallace's Trotting Register; "that he had sent for the certificates and that he had expected to have received them by the day of the sale." He also stated "that he would leave the certificates at the Lincoln National Bank." He also stated: "That Rushville and Vivesse were both registered horses. On the strength of that, the colts were sold at an average of one hundred and seventy-five dollars per head. They were nearly all yearlings. Of course the certificates never came, the colts never could be registered, and it turned out also that Mr. Wallace had refused the registration of Rushville; he so informed me personally in New York, and I also have a certificate under seal stating that he refused to register Rushville.

Several parties that had purchased these colts and paid for them employed me to see what could be done with Mr. Reiger. I have several letters from him in which he says: "that he will have Rushville recorded," but he does not pretend in these letters that any of the colts that were sold here were standard.

I commenced criminal prosecution against Reiger and obtained a requisition on the Governor of Kansas, but Reiger left for Texas the morning the officer arrived at his place in the evening and in that way the authorities of this state were never able to get hold of him for the purpose of a criminal prosecution.

It turned out that L. Reiger was George J. Reiger's wife. These colts to all appearances as they have grown older, are from mustang mares, probably some of them sired by Rushville, but I do not think any of them were by Vivesse, for the reason that he did not purchase that horse until the 29th day of July, 1889.

I will try and find one of the advertisements made by this man Reiger in advertising his sale of these colts. This man Reiger's real name is Brown, and he came from some place, I think Richmond, Ind., and it is said he left that state to escape criminal prosecution and changed his name to Reiger. Of one thing you may be very certain: that he is a rascal pretending to sell standard-bred trotting colts, with bogus pedigrees, that were sired on a ranch down in Texas from mustang mares. I have the names of witnesses by whom I can prove that the dams of many of the colts sold in Lincoln were mustang mares shipped from Texas to Halstead, Kas.

Since writing the above I have found one of the advertisements of this sale and enclose it in this letter but I would like to have you return it to me as I may need it if we can ever lay hands on Mr. Reiger. You will notice at the bottom of the front page he says: "A certificate of registration of each colt will be furnished." He gave this paper to me while I was looking at his colts and I have kept it ever since. I asked him what he meant by a certificate of registration? He answered me that he meant a certificate from Wallace's trotting registry, that the colts were standard-bred.

Very respectfully yours,
E. D. BLINN.

Accompanying the altered certificate in the case of Annie Ray was a letter from the owner of the mare, which is herewith given.

SAVANNAH, GA., March 14, 1892.

J. H. STEINER,

Dear Sir—Please find enclosed certificate of registry for mare, Annie Ray, as handed me by Reiger, of Reiger & Dunn—that is he represented himself as that person to several of our horsemen. I called his attention to the papers when he handed them to me, and he got very angry, using very filthy language, so much so that I have doubts that he is the Reiger of the above firm.

W. H. RAY.

This is the story in brief of as deliberate a fraud as ever was perpetrated in connection with the pedigree of a trotting horse, and the alteration of the certificate issued from this office as to Annie Ray is an offense which may prove a more serious affair for Mr. Reiger than he imagined it would when perpetrating the act. A recently adopted rule of the American Trotting Register Association provides that in case attempted fraud in the matter of a pedigree, no animals which depend for registration on the evidence of persons connected with such fraud shall thereafter be registered, and consequently purchasers of trotting stock would do well to avoid George J. Reiger of Midland, Tex., and the Thornhill stock farm, of which he is one of the proprietors, unless these matters are speedily and satisfactorily explained.

Sires in the Great Broodmare Table.

IT is only a matter of fifteen years or so ago—in 1875, unless memory is at fault—that the first list of mares that had produced two or more trotters or pacers with records of 2:30 or better was compiled, and at that time not more than a dozen mares had so distinguished themselves, while now it takes thirty-seven pages of the Year Book to contain the names, there being something like 800 of them on the records. In fact, during the last few years such remarkable accessions have been made to the ranks of great brood mares, and so much more attention is now paid by breeders to the question of dams in pedigrees than was formerly the case, that the subject is of more than ordinary interest.

A study of the Great Brood Mare table in the recently issued Year Book, and a considerable amount of figuring theron, brings to light the fact that at the present time no less than seventy-six stallions have sired two or more daughters that are in the Great Brood Mare table. The list of these Great Brood Mare sires is given herewith, and it will prove both interesting and instructive. Of the names it contains, the most prominent is that of Rysdyk's Hambletonian, ten of whose daughters are in the Great Brood Mare list with twenty-five 2:30 or better trotters and pacers to their credit. Next to Hambletonian himself comes

Digitized by Google

his grandson, Almont, with an equal number of daughters in the list, their total produce being only four behind that of the daughters of Hambletonian. After these two leaders, the founder of the Hambletonian house, and one of his greatest descendants, comes the potent Pilot Jr. blood with nine mares that have produced twenty-seven trotters and pacers with records better than 2:30, which average per mare is the best in the list where five or more mares are considered, although it is beaten farther down the line by the four daughters of Harry Clay that have produced fifteen trotters, and equaled by the four daughters of Jay Gould that have twelve to their credit. It is also beaten by two daughters of Mohawk Chief, and two of H. B. Patchen, with nine to their credit; but, considering their number, the average of the Pilot Jr. mares is unquestionably the best.

The blood lines represented in this list of stallions that have sired two or more representatives in the Great Brood Mare table, are, it will be noticed, largely of the Hambletonian variety, as in addition to the head of the house himself leading the list, he is represented by sixteen sons, eight grandsons and a few great-grandsons, so that Hambletonian and his direct descendants in the male line, comprise considerably over one-third of the names, this strain of blood being followed in point of representation by that of Mambrino Chief through the old horse himself and his male-line descendants. The list is as follows:

NAME.	SIRE.	Great Broodmare Daughters.	No. of Produce.
Rysdyk's Hambletonian	Abdallah	10	25
Almont	Alexander's Abdallah	10	21
Pilot Jr	Pacing Pilot	9	27
Seeley's American Star	Stockholm's Am. Star	8	17
Alexander's Abdallah	Hambletonian (10)	7	15
George Wilkes	Hambletonian (10)	7	14
Belmont	Alexander's Abdallah	6	16
Mambrino Patchen	Mambrino Chief	6	15
Messenger Duroc	Hambletonian (10)	5	11
John Dillard	Indian Chief	5	11
Harry Clay	C. M. Clay Jr	4	15
Jay Gould	Hambletonian (10)	4	12
Woodford Mambrino	Mambrino Chief	4	11

The Pace and Trot.

THE trotter, Prince Hogarth, that has a record of about 2:25, at that way of going, has, according to an Ohio paper, which commonly juggles the English language in a very interesting if not artistic manner, "been converted into a pacer." This is about on a par with the expression "fit into the war," but a criticism of the Ohio paper's pigeon-English (which would be a Sisyphus-like job) is not the point in question just now. When people talk about a trotter being "converted" to pacing, the statement is, without an exception, an erroneous one, because ther is no conversion about it, the natural gait of the animals being a pace, while they have been taught to trot by the use of toe-weights, peculiarly constructed shoes or hobbles. In the old days, when pacers were not worth over thirty per cent of what trotters of

Digitized by Google

the same speed would bring, it was the invariable rule to try and make a trotter out of every pacer by loading his feet with weights, and the temptation to pursue this plan was all the greater, because, as a rule, when a pacer was shifted over to a trot he retained all his speed, and frequently even improved on it, a notable instance in this regard being Smuggler, whose record of 2:15¼ was for seven years the best to the credit of a trotting stallion. Nowadays, instead of trying to make pacers trot, sensible men let such animals keep at the gait that nature has best fitted them for, and it is not infrequently the case that after a horse has made a record of 2:30 or better trotting, it will become evident that, with a little alteration in shoeing and rigging, he would go well pacing, and the rule is to let this kind make their change of gait and stick to it. In addition to Prince Hogarth, the gray mare, Elcho, 2:27¼, as a trotter, is now being allowed to pace, and there are others in the same boat. As a matter of fact, every season sees quite a number of additions to the list of horses that have made records of 2:30 or better at both trotting and pacing, and it is a recognized fact that in the case of stallions and mares a dual record of this sort is a first-class recommendation when they are offered for sale, with the idea of being used in the breeding ranks, or their produce comes under the auctioneer's hammer. People are awake to the fact that Sidney, who is by the records the greatest sire of extreme and early trotting speed of his age, is double-gaited, and was originally trained as a trotter, with excellent prospects of beating 2:30, at that way of going, when a three-year-old, but as he took more naturally to pacing, it was as a side-wheeler that he made his record of 2:19¾. His daughter, Fausta, who last year lowered the yearling pacing record to 2:22¾, has a record of 2:40 trotting, and when one considers the infinitesimally small porportion of yearlings that can step a mile in that time on a trot, it is within bounds to say that a 2:40 yearling is a phenomenon, so that while Fausta's work as a trotter is, of course, greatly overshadowed by her 2:22¾ performance as a pacer, it is nevertheless true that in addition to being the world's champion yearling pacer, she was also a phenomenal yearing trotter. In fact it is a pretty fair sort of rule for general application, that a double-gaited horse is more liable to develop a remunerative rate of speed than almost any other kind, and drivers are a little prejudiced in favor of them. Years ago, when not much was known in a practical way regarding the interchangability of the trot and pace, it used to be a saying among drivers that horses which ambled a little in starting off were almost certain to be good ones, and when pressed for an elucidation of the point, they would say that the ambling gait denoted looseness of action and consequent ability to strike a high rate of speed.

The Covered Track.

THERE is no doubt as to the popularity of the covered track among breeders and others who have to do with the management and development of colt trotters, and from present appearances the multiplication of this latest adjunct to speed-making will be so rapid that before long it will be the exception where a yearling trotter of good blood lines is not given a chance during the winter months to proceed satisfactorily with his lessons in learning to trot.

Thus far the covered track is practically an experiment, although a successful one. Sam Gamble, a horseman of considerable experience, says in a letter to the editor of the MONTHLY, writing of covered tracks: "I fully endorse them in your eastern winters, and in my judgment eastern breeders and trainers will derive the most benefit from covered tracks by the advantage it will be to their yearlings and two-year-olds on account of early breaking and development of speed. From a three-year-old and upward I should prefer road work during the pleasant days in your winter months. As to preparing for colt stakes that are ordinarily trotted in August, I should advise the covered track work for yearlings, two-year-olds, and also three-year-olds during the winter months, and in April and May occasionally let up on them and allow them to have a little vacation on the grass. They will be much better by so doing by August and later on. This has been my experience. The covered track work will teach them something and also season them. My object in allowing them the occasional vacation in April and May is that the colts will thereby forget the long tedious jogging they have received during the winter months and will get cooled out by the grass, and by June and July the fast, brushy work they should receive to make a high rate of speed they will learn very quickly, and also to keep up a fast clip. By August they will be in fair form and keep so if not overtaxed. They should con-

Digitized by Google

tinue to improve until fall if they are bred in the right lines. I predict that by the use of the covered-track system during the winter months some one during the next five years will breed a yearling to cover a mile in 2:20, a two-year-old to beat 2:10 and a three-year-old in 2:07."

Mr. Charles Backman, who is certainly a successful breeder, says: "I have never seen a covered track, therefore I do not know whether it is a benefit or a detriment. I have always been able to give my young stock all the exercise they wanted in the open air."

Henry C. Jewett & Co., who own the best known covered track in the world, say with quiet sarcasm: "It may possibly take a few years to enable any one with experience to answer your questions so as to be absolutely correct. At present we prefer not to say much about it, we think perhaps it would be best to let those who have had no experience in the matter decide the question, as is so commonly done by writer and turf papers on so many topics of the day."

Mr. C. J. Hamlin, who has raised about as many race-horse trotters as anybody, and who is also successful in the production of fast colts, says that he believes the principal benefit derived from a covered track to be in the opportunity afforded to give regular work and exercise to the horses and to way-wise colts and fillies that are in the breaker's hands.

The subject is one of interest to every horseman and breeder, and the columns of the MONTHLY are open for its discussion.

"Mambrino" Makes an Argument.

AMONG the answers received by President Allen of the American Register Association to his circular in reference to the registration of pacers on a 2:25 basis, was the following from Mr. H. D. McKinney, of Janesville, Wis.:

Your circular letter of the 20th duly received.

Regarding the rules under which horses may be registered I have always entertained views possibly peculiar to myself. In my judgment, amending the original rules, was one of the most unfortunate things that could have occurred to the horse-breeding industry of America. It virtually stopped one cross-breeding, which I believe was in the interest of the average breeder of the country at large, as that line of breeding was progression in individuality if not in speed development, giving us an animal of more uniform size, higher style, and in fact the horse that finds to-day a ready sale, and always will at a remunerative price, *i. e.*, the coach and carriage horse. Amending the rules was virtually sacrificing the multitude that a few might be benefited, resulting in every pretentious breeder keeping all of his standard-bred colt foals entire, irrespective of size, color or soundness, and this has resulted in placing in the small studs all over the country large numbers of stallions that should have been gelded. With the brood mares it is even worse. Many highly-formed, but non-standard mares, have been forced from the farm to give place to new standard, far inferior in all points of individual excellence.

But you do not want an essay on breeding, so will say, in answer to your interrogatories:

No. 1. Yes, unless amended as suggested above, by restoring the original rules.

No. 2. Answered by No. 1.

No. 3. Yes. How are they to be separated? A pacer is a lateral-gaited trotter, the gait being interchangeable from the diagonal trot to the lateral trot, and it is a very simple matter at that. A pacing horse always trots forward. When he changes to a trot he simply changes his action behind, the same as a soldier breaks step; the same from pace to trot. So all talk about trotting conformation, pacing conformation, etc., is simply "bosh." The pacing register by registering the youngsters will in a short time become in a measure a trotting register. No doubt many young things registered as standard-bred pacers will in due time make records as trotters and become standard trotters by performance.

No. 4. Answered by No. 3.

No. 5. No. I notice in the turf journals that Secretary Steiner states that a pacer may be registered as "standard," but not a "standard trotter." Now it is a sure thing that many pacers are being daily registered as standard-bred trotters. A foal by a standard-bred trotting horse, out of a standard-bred trotting mare is a standard-bred trotter, and so registered. When it comes to development it turns out to be a pacer. I have one myself, Opulence 10323; registered standard-bred trotter; sired by Ferguson, trotter, son of George Wilkes, trotter; dam by Sweepstakes, trotter; 2d dam by Young Fillingham, trotter, son of George Wilkes; 3d dam by American Star; he, Opulence, was quite a trotter; is now a *very fast* pacer. What are you going to do about it?

Digitized by Google

Cancel his number? Direct was a standard-bred trotter; he is now pacing and a standard pacer, but nevertheless he is a standard-bred trotter. He is only one of a large number that have made dual records. If two separate registers are to be kept, we can readily see that the foal of to-day after being a registered trotter, later turns out a pacer, must we then duplicate our registration? We know that trotting-bred sires and dams will occasionally produce a pacing foal. We also know that pacing sires and pacing dams will occasionally produce trotting foals. There should be no separation of families; all should be registered in the same old family record. Separation of families caused no little trouble in the South before the war; let us avoid war and register all members of the same family in the same book of record. When they gain records then we can designate in the volume of the register the form of action, either diagonal or lateral trot, in which the record was made.

I wish right here to make one very important suggestion, and that is this: We have now ten volumes of registration matter. To run through all of them, looking up animals, occupies much time. Give us a consolidated index of everything registered with reference marks up to date. The breeders will appreciate it and buy it freely. In fact many would buy an index without the volumes as it would assure them of the registration of an animal.

No. 6. Most certainly, with the same requirements by the judges that obtain in all other speed contests. The time made is a measure of merit to the credit of both sire and dam. The public can accept it accordingly; they of course can judge for themselves of the degree of merit attaching to the performance. A horse with a record of 3:00 is entitled to the same consideration in reducing his record as a horse with a record of 2:05 has. No discrimination between horses with fast records and horses with none wishing to make one.

Really, if our Register Company would have the multitude rise up and call them blessed, they would restore the old rules, then it would be but a short time before the great West would have from the American-bred trotting horse the perfect American-bred carriage horse for both the home market and for export, while the breeders of trotting speed exclusively would in no wise be injured, leaving it entirely to man's intelligence to judge of the standard of excellence upon which all breeding should be based.

Iowa's "Ringer" Bill.

THE following is a bill to punish "ringing" that has passed both houses of the Iowa legislature and needs only the governor's signature to become a law. The bill was offered in the senate by J. D. Yeomans:

SECTION 1. That it is hereby made unlawful for any person or persons knowingly to enter or cause to be entered for competition, or to compete for any purse, prize, premium, stake or sweepstake offered or given by any agricultural or other society, association, person or persons in the state of Iowa, or to drive any horse, mare, gelding, colt or filly under an assumed name, or out of its proper class, where such prize, purse or premium, stake or sweepstake is to be decided by a contest of speed.

SEC. 2. That any person or persons found guilty of a violation of Section 1 of this act, shall, upon conviction thereof, be imprisoned in the penitentiary for a period of not more than three years, or imprisoned in the county jail of the county in which he is convicted for any period not more than one year, and shall be fined in any sum not exceeding one thousand dollars.

SEC. 3. That the name of any horse for the purpose of entry for competition in any contest of speed shall not be changed after once having contested for a prize, purse, premium, stake or sweepstake, except as provided by the code of printed rules of the society or association, under which the contest is advertised to be conducted.

SEC. 4. That the class to which a horse belongs for the purpose of an entry in any such contest of speed shall be determined by the public performance of said horse in any former contest or trial of speed as provided by the printed rules of the society or association under which the proposed contest is advertised to be conducted. And any person or persons knowingly misrepresenting or fraudulently concealing the public performance in any former contest, or trial of speed of any horse, which he or they propose to enter for competition in any such contest shall, upon conviction thereof, be liable to the same punishment as is provided in Section 2 of this act, whether he or they shall succeed in making said entry or not.

SEC. 5. This act shall take effect and be in force from and after its passage, and publication in the Des Moines *Leader* and the Iowa State *Register*.

Some More Opinions.

I notice that several good friends of mine are engaged in a new enterprise, and as it is a proper subject of public criticism, a subject in which I as well as thousand of others are interested, I beg to say a few words.

There is no reason whatever to think that the new register association will succeed, either in building itself up or in doing any damage to the one already established. It can not be said that it fills a want either long or badly felt. It is true that my friend, the editor of *The Horseman*, says there is no Register at present, but then he is only fooling. It is also true that certain gentlemen in New York City, very good men and valuable citizens, feel bad because the sale of the American Trotting Register did not go according to their way of thinking, but then the public don't care whether John Doe or Richard Roe serves it, so long as it gets its money's worth. Neither is it a matter of much consequence to the public whether Mr. Busbey did or didn't. The public airing of soiled linen is never an edifying sight, and the man with a grievance is, as a general rule, a common nuisance. The name of the National Association of Trotting-horse Breeders is used in connection with the new enterprise, I think unwarrantedly. The most of the members of the National Association may be found in the ranks of the American Register Association, and it is quite likely those who do not will decline to make Mr. Mali, Mr. Packer or Mr. Redmond their spokesmen in this matter. It would be pertinent at this time to show that these gentlemen are speaking with authority. Even should they represent the National Association of Breeders, and conceding that Messrs. Mali, Redmond and others have a just grievance, and even conceding that the American Register did wrong in changing the basis of registration, it would be contrary to the policy of the breeders that they should succeed: hence they will not succeed.—"*Aurelius*" *in American Trotter.*

I have interviewed a number of breeders about the alleged trotting stud book that Packer, Mali & Co. are trying to foist on the trotting-horse public. With one accord they are opposed to the scheme. They think the war that is being made on the American Trotting Register Association in certain quarters is not calculated to do the journal that is making the fight any good. One prominent breeder is very indignant because the journal referred to is trying to injure the Register Association, and says he does not feel inclined to contribute toward the support of the paper by advertising in its columns when its editor is writing and printing the most bitter articles attacking the registrar and trying to destroy the value of a property that cost the breeders of the country $130,000. Of the four hundred stockholders in the Register Association nearly one-eighth of them are Kentucky breeders, and I have yet to know a Kentuckian that does not get fighting mad when his property is attacked. He is a firm believer in the truth of the old saying: "If you love me you love my dog," and I am inclined to think my Chicago friends will find this to be true at no late day. —*Track Walker in Kentucky Stock-farm.*

Notes and News.

M. S. M. Solovieff, Functionary of Imperial Administration of Horses of Russia, is in this country. It is expected he will make a visit to Palo Alto before his return to Russia—for a purpose which may be surmised.

The owners of the sensational colt Monbars, that made a two-year-old record better than 2:17 last season, have decided to leave him in California until July 1st for the purpose of making a short season in the stud there with him, after which he will be shipped direct to Grand Rapids, Mich., and placed in the hands of George Starr, who will handle him.

B. C. Yorks, who is well known as a trainer and driver in connection with Thornless, 2:16½, will train this season for A. C. Beckwith of Evanston, Wyo.

J. H. McFadden, of California, recently passed through Chicago having in charge the stallion Redwood, 2:21½, a son of Anteeo and that will make a season in Kentucky and then be put up in one of the auction sales.

Writing on the subject of toe-weights and their use, J. W. Flack, of Milwaukee, who last year drove the three-year-old Pilot Medium colt Happy Pilot to a record of 2:25½, says: "My experience is that should a horse need weight to balance him it is very necessary to use toe-weights. Many trainers think that a toe-weight can be used only on a horse's forward feet, but my experience has been that more horses need toe-weights behind to make them go smooth, than forward. When a horse wants his weight behind it must be used in the toe of the shoe. I know many a rough-

Digitized by Google

gaited horse that if properly weighted behind would go fast, and to go fast means to go smooth. The secret of making a fast horse is to balance the animal so that his stride is equalized and he does not try to go faster with one end than with the other. One often hears the remark made that a horse over-trots himself. This is because he has more stride with one set of legs than with the other. Toe-weights will often remedy this and frequently a horse can be shod so as to get the desired effect. Every horse should be shod as lightly as possible and not interfere with his stride. Every horse needs to stride as far as possible and not dwell. As a rule a rapid stepper should be shod with a low heel and with a weight at the toe. This will give him a long stride and make him go faster. It is frequently the case that when a fast horse changes hands his gait is changed and often he improves in speed, which shows that he is better balanced and his stride is equalized."

IMPRESSIVE TESTIMONY.—If there be any thing in the idea that short speeches are the most impressive, the following direct testimony respecting Humphreys' Veterinary Specifics are to the point and convincing: Palmer Bros., City Livery, La Crosse, Wis., in a press letter; writes: We have used Humphreys' Veterinary Specifics for *twelve* years, and find no cause for regret, and we cheerfully recommend them to our friends.....B. F. Howard, of Duluth, Minn., adds: I had a very sick horse and was recommended to use these Specifics. I did so, and with the most satisfactory results, and since have never been without a good supply. Being actuated by the principle if you know a good thing tell it and let your friends have the benefit, I never fail to advise their use to all having the care of valuable stock.—*Exchange.*

TALKING about well bred stallions, there is one in California called Waldstein that comes pretty near filling the bill. He is by Director, 2:17; first dam, the dam of Waldstein, 2:25¼; second dam, the dam of Albert W., 2:20, and Bonanza, 2:29¼; third dam, the dam of Aurora, 2:27.

MABEL A., 2:23¼, a mare that was brought out several years ago by McHenry and driven to her record by him, was recently purchased by a Boston man who is going into breeding, she being in foal to Mambrino King.

THE stallion Heptagon, sire of Cleon, 2:22, and others, died recently in Pennsylvania.

BLANDINA, the dam of six stallions that have sired 2:30 or better speed, and also of a daughter that produced a pacer with a record better than 2:25, is not credited with a son or daughter with a record of 2:30.

ON the morning of Monday, May 2, there will be issued in New York the first number of the daily edition of *The Spirit of the Times*, a newspaper venture that, unless all the signs fail, should have success, as there is plenty of sport of various kinds to afford work and profitable patronage for a paper issued every day. It will of course be under the management of Mr. E. A. Buck, the editor and proprietor of *The Spirit of the Times*, and will take its place in the front rank of journals of this class.

BLACKWOOD'S RECORD.—On September 25 last at Sioux Falls, S. Dak., Robert L., by Artemas, Blackwood, by Rockwood, and Bomba, by Beverly Wilkes, competed in a special race, in which Blackwood was reported as winning the second heat in 2:24½. The report came to this office in official form, and is published on page 322 of the Year Book. Information reached us that this performance was not all right. Accordingly we wrote the secretary of the Sioux Falls Association, and from him have received statements from each of the three judges of the race, the starting judges, the timer and the clerk of the course. All these statements agree that Blackwood ran a considerable portion of the first half mile, that he trotted the last half mile in 1:09½, making the time for the whole mile in 2:19½, and that on account of his running they took off five seconds, giving him a record of 2:24½. As this proceeding is contrary to trotting rules we can not accept this record, and have taken Blackwood out of the 2:30 list. The time recorded 2:24½ remains a bar.

MISS RUSSELL, by Pilot Jr., and Maggie Gaines, by Blood's Blackhawk, are the only mares that ever produced two stallions that are the sires of trotters with records better than 2:16.

RUSSIA, of all European countries, is the most ardent in the support of the trotter, nearly $60,000 in stakes and purses for that class of horses having been given last year.

THIRTEEN mares have produced more than one performer in the 2:20 list. These mares are: May Day, Columbine, Midnight, Mollie Whitefoot, Waterwitch, Countess, Venus, Miss Russell, Soprano, Beautiful Bells, Fleetwing, Mary M. and Lizzie.

Digitized by Google

A HIGHLY bred colt was foaled in Tennessee recently, it being by Bow Bells (son of Electioneer and Beautiful Bells); dam by Alcantara, 2:23; second dam Noontide, 2:20½, by Harold; third dam Midnight (dam of Jay-Eye-See, 2:10; Electricity, 2:17¾, and Noontide, 2:20½), by Pilot Jr. In the pedigree of this youngster there occurs the blood of such great mares as Beautiful Bells, Minnehaha, Alma Mater, Green Mountain Maid, Midnight and Dolly Spanker, and it also shows the progress that is being made in breeding up the trotter in producing lines, it being now no uncommon thing to have a colt foaled that is practically a thoroughbred trotter in that it has five crosses of producing or performing blood on each side of the house.

A BROTHER to Prince Regent, 2:16½, was foaled recently at the village farm of C. J. Hamlin. It is a chestnut, with white hind ankles and star, and is the largest foal his dam ever had.

Additions and Corrections for the Year Book.

IN view of the immense amount of work necessary in the preparation of the Year Book, it is not surprising that some errors are made and overlooked. We made a very careful revision of the previous Year Book and have every reason to believe that Vol. VII is much more complete and correct than its predecessors. In a number of cases there is yet a difference between the records given in the Year Book and those given by the National Trotting Association. In many instances the difference is only a quarter of a second, but all these cases, however slight the difference, are being investigated.

During the past year we kept a standing invitation in the MONTHLY for the owners of new 2:30 performers to send us full information concerning every new comer in the list. Several parties failed to respond, and in consequence their animals appear with little or no pedigree, for which we are not to blame. In one case, the breeder did promptly respond to our request, stating he could give full information but thought it worth ten dollars. We promptly declined his offer.

We will be glad to have our attention called to any error or omission, as it is our aim to make the Year Book as correct as possible.

The following have been noted since the Year Book went to press:

Page 69—King Herod won the sixth heat of the race on July 9, in 2:24, instead of 2:21, and his record should be changed on pages 685, 728 and 947 to 2:21¾.

" 369—*John C.* won first heat in free-for-all pace at New Sharon, Iowa, in 2:34½, instead of 2:24½, and record should be so changed in index.

" 502—Billy H. appears twice. The first entry should be omitted.

" 503—Black Captain is registered in Vol. XI, No. 15262.

" 520—Cyclone's record of 2:30 (in 1885) was made to top road wagon, but has never been so marked in the Alphabetical list and Table of Sires in the previous Year Books.

" 541—Free made her record of 2:29¼ on September 22, 1891. Her owners write us that she afterward reduced her record to 2:26½ at Meadville. Pa., but the official record of that performance did not reach us.

" 553—Heward H., the "said to be," comes out. He was bred by John Connors, Merrittown, Ont., Can.

" 600—Nettie B., 2:25½, by Jim Irvin, appears twice, and the last entry should be omitted.

" 604—Olney Wilkes was foaled 1888.

" 609—Omit Phœnix 2:29½.

" 610—Prairie Belle's record is 2:26¾.

" 626—Omit Sleepy Dick and change record in index (page 984) to 2:34¼.

" 635—Topsey M., 2:30. We have received evidence substantiating her pedigree as follows: b m foaled 1881; by Trojan Boy; dam Topsey, pedigree not traced. Bred by H. G. Miller, Vischer's Ferry, N. Y.

" 647—The correct number of Albatross is 13024.

" 667—The correct number of Treasure is 3499.

" 669—Mary Marshal should appear in the 2:20 list, among those with records of 2:12¾, and she and Pennant should be omitted from list with records of 2:17.

" 692—Bridal Bells, 2:27½, appears under Beecher 2181, instead of under her sire, Bell Boy 5350, on same page.

" 700—Bonnie Doon was left as he appeared in Year Book for 1890. He is registered under the number

Digitized by Google

5322; is a bay horse, foaled 1876; by Blue Bull 75; dam Daisy Maid, 2:37, by Mambrino (Sweet's), son of Mambrino Paymaster Jr., etc. Bred by Mark Smith, Muncie, Ind.; passed to Shirk & Gifford, Tipton, Ind.

Page 721—Duroc Prince. We were informed that the sire of *Rosie C.* (which was given in 1890 Year Book as Draco Prince) was Duroc Prince; that he was a son of Messenger Duroc 106, and that he was registered in Vol. III. As our informant did not give the dam, we took it for granted that it was the Duroc Prince registered in Vol. III, on page 181, but it is the one registered in same volume, on page 378, under his dam Lavina, by Truesdell's Hambletonian, being a black horse, foaled 1877.

" 814—Surprise. This horse was given in Vol. I, of the Year Book, without any pedigree, and so continued until Vol. V, when he was given as "b h foaled 18—; by Comet; pedigree and history not recorded. Located at Walker, Iowa." In Vol. VI, of the Register, page 447, he appears as follows:

Surprise, b h foaled 1867; by Comet (Culter's), son of Herrick, by Black Hawk 5; dam Fanny, pedigree not traced. Bred by Milton B. Persons, Dodgeville, Wis.; passed to William Alderman, Dubuque, Iowa; then to P. M. Wilson, Walker, Iowa.

" 824—Wapsie 688. In Vol. V of the Year Book he was given a record of 2:25, which error has continued to the present. His record should be 2:35.

" 825—Western Chief 695. Cottonette appears as a pacer, but she is a trotter, and her dam, Cotton Picker, is a pacer.

" 834—Under Bassinger, the line, "Sire produced by daughter," etc., should appear under Bay Chief.

844—Belle Brandon should be credited with being the grandam of Clay King, 2:27¾.

Page 855—Indiana, by Mambrino Chief 11, should be credited with being the grandam of Instant, 2:24¼.

" 856—Jenny Martin, by Canada Jack, is also the dam of *Alexander Dumas*, 2:20¾; b h by Dumas 2669.

" 865—Mary Hulse is also the dam of Twilight 315, sire of two trotters, one pacer.

Authorities differ in regard to the correct harness record of Lady Suffolk, the majority giving her record of 2:28, made in 1844, as to harness, but the performance of 2:29½ in 1845 is probably her first record to harness better than 2:30.

Questions and Replies.

L. L., LOAMI, ILL.—Is the horse Messenger Golddust registered? If so give his number.

ANSWER.—Messenger Golddust is not standard or registered. He is sire of Kate Keener, 2:29¼, and recorded as a son of Golddust 150. Further history and pedigree unknown.

G. G. F., ADRIAN, MICH.—1. Has Arden 13930 a record of 2:30 or better? 2. Has he any record? 3. Has Belle of Peru any record?

ANSWER.—1 and 2. Arden has a record of 2:29¾ made at Independence, Iowa, October 24, 1890. 3. Find no record of any kind for Belle of Peru.

A. H. B., DANBURY, CONN.—1. Is Fleetwing by Black Eagle, dam Fanny Fern, standard? 2. Is Daisy Dean by Grey Eagle, dam Lightfoot, standard?

ANSWER.—1. No. 2. No.

S. P. DEV., GRAND RAPIDS, MICH.—1. Give best record of bay gelding Waldo, trotter. 2. Best record of brown gelding Brown George, pacer.

ANSWER.—1. 2:42, at Ionia, Mich., September 25, 1891. 2. 2:29¼ at Grand Rapids, Mich., September 18, 1891.

F. O., MINIER, ILL.—Is Melrose Wilkes standard and registered?

ANSWER. Yes. No. 5239.

J. W. P., WALLA WALLA, WASH.—Please give breeding of Hunt's Commodore.

ANSWER.—Bay horse, foaled 1828, by Mambrino, son of imp. Messenger; dam by True American, son of Volunteer, by imp. Messenger; second dam by imp. Tom Bogus.

C. W. M., OCHRE, VA.—Inclosed find pedigree of thoroughbred stallion Harry B. 1.

Digitized by Google

Is the horse registered; if so give his number. 2. Is the pedigree inclosed correct?

ANSWER.—1. Harry B. is registered in Volume IV, American Stud Book, page 411. Thoroughbred horses are not registered by number. 2. The pedigree is correct, except for a few errors in spelling; practically all right.

S. T. V., CANAL DOVER, OHIO.—My neighbor has a mare; he breeds her to my stallion; after she is bred I buy her, and get no pay for the service of my stallion. The colt is foaled for me. Who is the breeder of the colt? I own the mare of course.

ANSWER.—Your neighbor is the breeder of the foal. It is well established that the breeder of an animal is the person who selects the parents, and by virtue of ownership or other authority causes them to be mated.

R. D. W., RUSH CREEK, OHIO.—Give full pedigree of Electioneer, especially on dam's side.

ANSWER.—Electioneer 125, bay horse foaled 1868; by Hambletonian 10; dam Green Mountain Maid, by Harry Clay 45; second dam Shanghai Mary; pedigree untraced. Harry Clay 45, by Neaves Cassius M. Clay Jr. 20; dam Fan, by imp. Bellfounder.

INQUIRER, ATHENS, PA.—1. Is number and breeding of Gold Patch, as given in inclosed advertisement, correct? 2. If so what is number and breeding of the Royal George which sired his grandam?

ANSWER.—1. The breeding of Gold Patch 15413, as registered, is chestnut horse foaled 1887; by Nutpatch 8713; dam Nelly C., by Artemas 1793; second dam Nell, by Royal George 9852. Further pedigree not recorded. 2. Royal George 9852 (Murphy's), chestnut horse foaled 186-; by Royal George 393 (Howe's); dam said to be by Cadmus; second dam said to be by Nimrod Messenger. Murphy's Royal George is sire of Russian Spy, 2:26½.

J. D. F. CLYDE, OHIO.—1. Is Robert Fillingham Jr. standard? If so, is he eligible for standard registration as sire of Joe Ray, 2:30, and *Dr. W.*, 2:24½?

ANSWER.—1. Robert Fillingham Jr. is now standard and registered number 18722, and will so appear in Vol. XI, American Trotting Register. He has been registered very recently (since the year book for 1891 was printed), hence does not appear therein with a standard number. 2. Robert Fillingham Jr. is registered under Rule 4, being the sire of *Dr. W.*, 2:24½. He is not credited with Joe Ray, 2:30, pedigree of that performer not being established.

B. M., EDENBURG, IND.—1. Has Joe Jefferson 4661, any 2:30 performers? If so how many?
2. Which horse is sire of Joe Mack?

ANSWER.—1. No. 2. Do not know to which horse you refer. There is no horse named Joe Mack in the 2:30 list, pacing or trotting.

J. K. C. PATERSON, N. J.—1. Who owned Hill's Black Hawk? How many sons did he have and were they standard bred?

ANSWER.—1. Black Hawk 5, known as Hill's or Vermont Black Hawk, was foaled 1833. Bred by Benjamin Kelly, Durham, N. H.; died 1856, the property of D. Hill, Bridport, Vt. 2. There is no data which would give the number or names of all the sons of Hill's Black Hawk. He sired a great many horses, some of which afterward became standard by their own performance, or that of their progeny. Fourteen of his sons are sires of 2:30 performers. Can not suggest any way of your tracing up the history of pedigree on dam's side of an unnamed son of Hill's Black Hawk, nor is it very likely that the mares referred to by you were sired by a son of Hill's Black Hawk, which died in 1856.

J. B. B., BARDSTOWN, KY.—Please give name and address of owner of bay mare Thalia, 2:24¾, by Col. Hambrick.

ANSWER.—Thalia was entered for her performances of 1891, by C. G. Squires, Millersburg, Ohio, and as owned by W. O. Barnes; residence not stated.

Catalogues for 1892.

UNADILLA VALLEY STOCK FARM.

THE breeding farm of Messrs. C. D. and H. H. Wheeler is situated at West Winfield, N. Y. In their catalogue for 1892 they offer for public service four highly-bred trotting stallions, viz.: Forrest Prince No. 8831, record 2:19¼, by Hambletonian Prince 819; dam Majolica, by Henry Clay 45; second dam by Revenue, son of imp. Trustee. Keywood 10592, record 2:30, by Onward; dam Mary K., by Ericsson; second dam Minnie Clyde, by Brignoli; third dam, by Gano. Prince Look 7301, by Look 2355, son of Nutwood; dam Susie W., by Hambletonian Prince; second dam, Lucy,

Digitized by Google

by Black Hawk Plato; and Harry Prince 6133, by Hambletonian Prince 819; dam Topsey Spanker, by Victor; second dam Kate House, by Gifford Morgan Jr. The pedigrees, family history and individual characteristics of these horses are fully set forth in the handsome pages of the catalogue which is further embellished with well executed portraits of Forrest Prince and Keywood. The broodmares at Unadilla Valley Stock Farm as set forth in the catalogue are fifteen in number, mostly standard and registered, and all of stout trotting lineage. Fifteen colts and fillies from one to three years old are also fully described and offered for sale.

BLACK MEADOW FARM

is situated close to the city of Detroit, Mich., and is the property of Messrs. Baker and Campbell, who issue a well-arranged catalogue of standard-bred trotters, the property of F. A. Baker, one of the proprietors. This is the second annual catalogue, issued by Mr. Baker, and an examination of its pages shows that the animals owned and bred on the farm are the result of careful selection and a just appreciation of present fashion in trotting pedigrees. The stallions in use and offered for public service are four in number, the premier being Carlisle 5385, record 2:22¼, by Piedmont 2:17¼; dam Idabelle, by Hambletonian 10; second dam by Seeley's American Star. Public performance in the individual, developed speed in the sire, and the thoroughly tried and tested Mambrino Chief, Hambletonian American Star cross, are united in this horse. Favo 6965, by Carver, son of Onward; dam Lady Salyers, by Ericsson; second dam by John Dillard, is the next horse on the list, followed by three of Mr. Baker's breeding, viz.: Teusha Grondie 5001, by Spartacus 1923, dam by Belmont, second dam by Mambrino Chief. Chaucer 11927, by Nuttingham 4992 (son of Nutwood and Adelaide 2:19¾); dam Niobe by Sorrento; second dam Juba by Belmont; third dam by Mambrino Chief; and Hendrie 14786, by Patron; dam Mollie Morton by Banker Rothschild 5747; second dam by Fields Royal George; third dam by Vermont Black Hawk. Chaucer and Hendrie are reserved as private stallions. A careful examination of the pedigrees above briefly referred to shows that developed speed and producing dams are to be found on every page. Twenty mares and fillies are catalogued, all of stout and desirable trotting strains. The catalogue is handsomely printed, with the pedigrees clearly and conveniently arranged. In addition to the standard-bred trotters the pedigrees of the Black Meadow Herd of Bates-bred short-horn cattle are fully set forth in the catalogue.

PREMIUMS FOR RECORDS.

IN a new edition of the catalogue of trotting stock at Seacord Stock Farm, Galesburg, Ill., the proprietor, Fred Seacord, offers the following liberal premiums to the owners of the get of Muscovite 5221, record 2:19¼, the premier stallion at the farm. No. 1. Five thousand dollars to the owner of any yearling which gets a record of 2:30 or better. No. 2. One thousand dollars to the owner of any two-year-old which gets a race record of 2:30 or better, provided they have not a yearling record of 2:30 or better. No. 3. Five hundred dollars to the owner of any stallion, mare or gelding, of any age which gets a race record of 2:30 or better, provided they have not a yearling or two-year-old record of 2:30 or better. The only reservation made on the above premiums is, that should Muscovite die or I should sell him, my obligation as to payment of above premiums cease on the day of death or sale.

THE EMPIRE CITY STUD.

No handsomer or more elaborate catalogue has been issued this year than that of the Empire City Stud Farm, situated at New Hudson, Allegany Co., N. Y., William Simpson, proprietor, office 91 Park Row, New York. Every page is a work of art, and the catalogue is embellished with high-class engravings, portraits not only of the stallions, but of many of the broodmares; in all twenty-five beautiful horse pictures. The animals enumerated are of the highest class, and fully warrant the statement on the opening page. "Every animal in this catalogue is standard and registered. The mares are not only got by the best sires, but, what is more important, they are equally well bred on their mother's side." The stallions on the farm offered for public service in 1892 are Electrician, Globard and Witchcraft. Electrician 5007, record 2:24¼, is by the great Electioneer 125; dam Rebecca, by Gen. Benton 1755; second dam Clarabel, by Abdallah Star; third dam Fairy, by Hambletonian 10; fourth dam Emma Mills, by Seely's American Star 14. Electioneer is sire of 101 2:30 performers; Rebecca is dam of Anana, 2:26, Bemal, 2:24, Electrician, 2:24¼ and Rexford, 2:24; Clarabel is dam of Clifton Bell, 2:24¼, and the fourth dam, Emma Mills, is dam

Digitized by Google

of the well known trotting sires, Sweepstakes, Independent and Glenair, also of Camille, dam of Stevie, 2:19—a pedigree unsurpassed for prepotent and producing ancestors. Globard 7757, record 2:29, is by Belmont 64; dam Georgie, by George Wilkes 519; second dam Black Kitty, by Ericsson 130; third dam Lady Walker, by Capt. Walker; and Witchcraft 5887, by Brown Wilkes 2040, record 2:21¾; dam the grandly bred mare Watersprite, by Belmont; second dam the great broodmare Waterwitch, by Pilot Jr.; third dam Fanny, by Kinkaid's St. Lawrence. Waterwitch is dam of Mambrino Gift, 2:20, Scotland, 2:22½, Viking, 2:19¼, Waterloo, 2:23¾, Wavelet, 2:24½; of two producing sons and of the dams of seven 2:30 performers. A number of other stallions and colts are tabulated and described, all of gilt-edged trotting ancestry. The mares and fillies are equally desirable from the standpoint of breeding and individual merit; they are sired by such horses as Alcantara, Alcyone, Belmont, Bell Boy, Chimes, Dictator, Electioneer, Ethan Allen, George Wilkes, Hambletonian, Harold, Happy Medium, Lord Russell, Mambrino Patchen, Nutwood, Stamboul, Sultan, and a score of others nearly as fashionable and desirable. Specially noticeable is Bertha, by Blackwood, dam of Delegate, 2:27¾; Cora Belmont, 2:24½, sister to Nutwood and dam of Cora S., 2:25¼, a mare also owned by Mr. Simpson; Directress, by Dictator, a full sister to Director, 2:17; Georgie, by George Wilkes, dam of Globard, 2:29; Noontide, 2:20¼, by Harold, dam Midnight, dam of Jay-eye-see 2:10; Orange Girl, 2:20, by Hambletonian 10, and Susie D., by Alcyone, full sister to Alcandre, 2:26¼. The Simpson herd of Jersey cattle and a small band of Miniature Shetland ponies are also kept on the Empire City Stud Farm.

THE HOME OF THE WILKES FAMILY.

ASH GROVE, Lexington, Ky., is the title of the catalogue of trotting stock issued by "George Wilkes" Simmons, the owner of the great George Wilkes 519, for many years and at the time of his death, and now the owner and advertiser of some of his best and most prepotent sons. Eight highly bred trotting stallions are announced in the catalogue to make the season of 1892 at Ash Grove, and their pedigree, performances and individual excellence are fully set forth in its pages. The premier stallion is Jay Bird 5060, by George Wilkes 519; dam Lady Frank, by Mambrino Star; second dam Lady Franklin, by Estey's Black Hawk. Jay Bird is sire of sixteen 2:30 performers, his list headed by Allerton, 2:09¼. William L. 4244, by George Wilkes; dam Lady Bunker, by Mambrino Patchen; second dam Lady Dunn, by Seely's American Star, is next, the sire of Axtell, 2:12, at 3 years, and a full brother of Guy Wilkes, 2:15¼. Eagle Bird 5867, 2:21, by Jay Bird; dam Tansey, by George Wilkes; second dam Dame Tansey, by Daniel Lambert, is an inbred Wilkes, and demands special attention as sire of the phenomenal two-year-old Monbars, 2:16½. Young Jim 2009, by George Wilkes, out of the Lear Mare, dam of Jim Irving, 2:23, is a tried and successful sire, with fourteen 2:30 performers to his credit, including Garnet, 2:19, Dandy Jim, 2:19½, and Butterfly, 2:19¾. These are the best known of the stallions advertised at Ash Grove, the younger quartette being Knight Hawk, full brother to Eagle Bird; Betterton 8022, by George Wilkes; sire of George St. Clair, 2:20¼, and Lulu B., 2:27¼; Prince Charles 6202, by George Wilkes, dam Sue Stout, by Surplus, and Monte Christo 4245, by George Wilkes, dam Mother Lumps, sire of Barclay, 2:22¼. The record of these Ash Grove stallions on the track and in the stud is sufficient recommendation, and the original home of the Wilkes family is likely to continue sending forth speed at the trotting gait for many years to come. A large number of highly-bred colts and fillies are included in the pages of the catalogue, and visitors to Lexington are cordially invited to visit the farm, or look up the genial proprietor at the Phoenix Hotel.

PROSPECT HILL STOCK FARM.

THIS great breeding establishment, Miller & Sibley, proprietors, has frequently been termed "The Palo Alto of the east," and this year, with Charles Marvin, superintendent of the training department, the appellation will be still more appropriate. An enterprise of such magnitude as that of Messrs. Miller and Sibley needs, however, no borrowed name, even one as famous as the Great California home of the Electioneers. Their energy, good judgment and liberal expenditure have established in a few years one of the greatest trotting studs in the world, and the second annual catalogue for 1892 contains the pedigrees of as many highly bred and fashionable animals as any yet issued. The sons of Electioneer are the prominent feature in the list of stallions, no farm on the continent, save possibly Palo Alto itself, having as many and as highly bred,

Digitized by Google

Electric Bell, dam Beautiful Bells; Belsire, his full brother; Cecilian, 2:22, at two years, dam Cecil, by Gen. Benton; Ah There, record 2:28½, dam Lizzie, by Wildidle; Ivo, dam Victoria, by Don Victor; Outcross, dam Sarah, by Shannon, are six in service on the farm, also Del Paso, 2:24½, by Dexter Prince, dam Daisy D., by Electioneer. To give a notice of even the more prominent animals of such an extensive catalogue is not practicable, as will be readily seen when stated that the book contains the full pedigrees and descriptions of eight stallions, eighty-five broodmares, eight geldings and sixty-six colts and fillies, foals of 1888, 1889, 1890 and 1891. The broodmares are the acme of intelligent and fashionable breeding, most of the prominent and successful trotting sires being represented. Electioneer is again prominent with seven of his daughters, and nine daughters of his sons St. Bel, Ansel, Eros and Will Crocker. The list abounds with producing dams and mares, with records of 2:30, or better, such as Daisy D., dam of Millard, 2:23; Minnie Drake, dam of Ollie Drake, 2:25; Princess Royal, dam of Templeton, 2:25¼; Richilders, dam of Bracelet (p), 2:21, and Barney Horn (p), 2:23¼; Coquette, 2:29½, Ecru, 2:30, Eula Lee, 2:29½, Farce, 2:29¼, Free, 2:26½, Geneve, 2:26¾, Maralia, 2:24¼, Minet, 2:27½, My My, 2:25¾, Nora Temple, 2:27¼, Sadie Bell, 2:24, and Veda, 2:29. The colts and fillies are largely the get of St. Bel 5336, race record at four years old, 2:24½, sire of Bel Onward, 2:23, at two years old, and Free, 2:26½, at three years old. The death, in 1891, of this great son of Electioneer and Beautiful Bells was a serious loss, not only to Messrs. Miller and Sibley, but to the breeding interests of the country. In addition to the extensive list of trotting-bred horses referred to in the Prospect Hill Farm Catalogue for 1892 it contains the pedigree and history of Javanais, imported French coaching stallion, a prize winner in France and the United States, and a notice of the High Class A. J. C. C. Jersey Cattle, Children's Ponies and Pure Bred Angora Goats. The front pages of the book are embellished with engravings and ground plans of the track and main horse barn, the stallion stable, the Jersey cattle barn and an excellent portrait of St. Bel. As a whole, the catalogue is a credit to the printer and compiler, Messrs. Miller and Sibley and the trotting horse interest of the country, which Prospect Hill Stock Farm so largely represents.

THE JEWETT FARM.

FOREMOST among the magnificent breeding establishments of Western New York is the Jewett Farm, owned by Henry C. Jewett & Co., at Jewettville, Erie county, N. Y., sixteen miles southeast of Buffalo. Few, if any, trotting establishments can show as many new 2:30 performers in 1891, owned and developed by the breeders, or sired by their stallions or out of their mares. In all, twenty-three such performers entered the 2:30 list last season, and sixteen of these were put in by their breeders and owners, H. C. Jewett & Co. Of the twenty-three, eight were the get of Jerome Eddy, three of Erie Wilkes, three of Sherman, two of Coronet, two of Patchen Wilkes and one each of Fieldmont and Homer. The twenty-third record was that of Patchen Wilkes, a son of George Wilkes, owned by the Jewett Farm. In the catalogue of this great breeding establishment for 1892, the history, pedigrees and performances of these new accessions to the charmed circle are fully set forth, occupying the first ten pages of the book, which also contains the pedigrees of seven stallions in use for breeding purposes, one hundred and ten broodmares and nearly, or quite, two hundred colts, fillies and geldings for sale or in training. This preliminary statement will give some idea of the magnitude of the breeding operations at the Jewett Farm, and of the extent of its catalogue, a handsomely printed and illustrated book of 205 pages. The quality of the animals set forth in the catalogue is first class in every respect, comprising some of the stoutest and most fashionable strains of trotting blood. The stallions in use and offered for public service are, first, Patchen Wilkes 3550, record 2:29½, by George Wilkes 519; dam Kitty Patchen (dam of Georgiana, 2:26¼), by Mambrino Patchen 58; second dam Betty Brown (dam of Anglin, 2:27½, and Wilkes Boy, 2:24½), also by Mambrino Patchen; third dam Pickles, by Mambrino Chief; fourth dam by Brown's Bellfounder; fifth dam by Gray Eagle. Developed and inherited speed is thick in this pedigree; a performer himself, record 2:29½, his sire with a record of 2:22, his dam and grandam both in the great broodmare list, and he the sire of four 2:30 performers, uniting the great Wilkes-Hambletonian strains with that of Mambrino Chief, through his greatest son, Mambrino Patchen, his breeding is highly fashionable and desirable. Jerome Eddy 1260, record 2:16½, is the next stallion described; by Louis Napoleon 207

Digitized by Google

(sire of fifteen standard performers); dam Fanny Mapes (dam of two standard performers and five producing sires), by Alexander's Abdallah; second dam Smith Mare, by Burr's Napoleon; third dam by L. I. Black Hawk. Jerome Eddy is a grand individual, a great race horse, and promises to be still greater as a sire. He has now eleven 2:30 performers, including Rollo, yearling record (pacing) 2:28½, and seven others with records of between 2:30 and 2:40. Sherman 1506, record 2:23½, by George Wilkes; dam Lady Belmont, by Belmont, is the next stallion on the list, fashionably bred, and the sire of Ashman, 2:19¾, Zyco, 2:26¼, and Heilo (pacing), 2:20½. Fieldmont 5050, is full brother to Almont Jr. (sire of Belle Hamlin, 2:12¾), by Almont 33; dam Maggie Gaines, by Blood's Black Hawk, and bids fair to equal his distinguished relative as sire of trotters, having now to his credit Don L., 2:28¾, Julietta, 2:28¼, and Tom Tucker, 2:29¾. Rochester 616, record 2:31½, by Aberdeen; dam Bonnie Lassie, by C. J. Wells, is the sire of six standard performers, of the dam of Zyco, 2:26¼, and of Willett, sire of Nabob, 2:30. Erie Mambrino 3567, by Mambrino Abdallah 2201; dam by Mambrino Patchen and Zanesville 16299, by Duke of Brunswick; dam by Flying Cloud, complete the list of stallions. The broodmares and youngsters referred to in the catalogue are too numerous for review as individuals. With remarkably few exceptions, they are standard or standard-bred, all well bred, with strong and prepotent trotting blood of the most fashionable strains. Mares with records and the dams of 2:30 performers occur frequently. Developed speed in sires and dams is the theory upon which the foundation of the Jewett Farm is laid, and every page of its catalogue for 1892 shows how clearly the idea has been carried out in its breeding operations.

TUSCARORA STOCK FARM.

THE catalogue of the fashionably-bred trotting stock of C. M. de Garmendia, Frederick county, Md., is a handsome little book of sixty-eight pages, well arranged and full of interesting trotting history and pedigrees. The head of the stud is Sea King 11775, by Lord Russell; dam Fairy Belle, by Belmont; second dam Waterwitch, by Pilot Jr. This is highly fashionable and prepotent blood on both sides. Lord Russell (full brother to Maud S., 2:08¾), by Harold, out of the great broodmare Miss Russell, is sire of nine 2:30 performers at ten years of age. Fairy Belle is dam of Fairy Gift, 2:30, and Nymphia, 2:26¼, and her dam, Waterwitch, is one of the greatest of broodmares, being dam of five 2:30 performers, two producing sires, and of the dams of seven 2:30 performers. This is blood that breeds on, and as Sea King is a grand individual with known speed, having shown miles close to 2:30, he should make a valuable and successful sire. Monocacy 9893, the next stallion on the list, has a three-year-old record of 2:37½, and a four-year-old record of 2:33, and is expected by his owner to trot close to 2:20 in 1892. His sire is King Wilkes 1867; dam Vivandiere, by Volunteer; second dam Martha, by Abdallah 1. This combines the popular Wilkes cross with that of Volunteer, thus concentrating the Hambletonian blood through two of his greatest sons. Tuscarora is by Sea King 11775; dam Duenna, by Woodford Mambrino; second dam Dahlia, by Pilot Jr.; third dam Madame Dudley. This horse also shows in his pedigree grand producing ancestry. In addition to the five great broodmares contained in the pedigree of his sire, his dam is by the great horse, Woodford Mambrino, and his grandam, Dahlia, is dam of three 2:30 performers, and her dam, Madame Dudley, is the grandam of ten 2:30 performers. The next horse in the catalogue, Kioto 3008, has a race record of 2:25, made in a contest of five heats at Philadelphia October 22, 1891. He is by Marmion Golddust 1894; dam Mischief (record 2:37), by Volunteer. Other stallions mentioned are: Easter King, by Sea King; dam Lucy Scott, by Cuyler. King Craft, by Sea King; dam Idoletta by Idol; Custodian, by Sea King; dam by Artillery; King Arthur, by Sea King; dam Manposa, by Artillery; King Bird, by Sea King; dam Lucy Belle, by Mambrino Joe; and Kiosk, by Sea King; dam thoroughbred. The broodmares, twenty-two in number, are exceedingly well bred, and with the young colts and fillies offered for sale, worthy the consideration of breeders and purchasers of high-class trotting stock.

Our New Advertisers.

THE advertisement of Mr. Robert Bonner for 1892 appears in this issue of the MONTHLY. Two highly bred and noted stallions are advertised for public service at the Tarrytown farm—Ansel, record 2:20, by Electioneer; dam by Lexington; second dam by Grey Eagle; third dam by Medoc, is one of the most pro-

Digitized by Google

nounced successes of the thoroughbred cross in trotting pedigrees.

Senator Stanford and Charles Marvin are both on record as predicting for Ansel a great stud career. Mr. Bonner in selecting him as a consort for the trotting Queen, Maud S. 2:08¾, has given him the highest possible endorsement. Ansel is sire of Ariana 2:26, Clarion 2:25¾, and Norris 2:22¼, all new-comers to the 2:30 list last year. The other horse advertised by Mr. Bonner is Eldridge, by Edward Everett; dam Jessie Kirk (dam of Majolica 2:15 and Miss Majolica, 2:24½), by Clark Chief; second dam Old Lady (dam of Little Miss, 2:26½ and Charlie Friel 2:15¾ pacing), by Capt. Walker. Eldridge is full of producing blood on both sides of his pedigree, Edward Everett being sire of fourteen 2:30 trotters, of the dams of twelve 2:30 trotters, and of nine sires of thirty-three standard performers.

THE pages occupied by the Ashland Park advertisement, B. J. Treacy proprietor, Lexington, Ky., are worthy the attention of trotting horse breeders. Mr. Treacy never talks or writes in a way to be misunderstood, and in his advertisement for 1892, the merits of his stallions are fully and clearly set forth. The horses mentioned are Bermuda 5874, by Banker, dam Pattie Patchen, by Mambrino Patchen. Fayette Wilkes 2036, by George Wilkes, dam Sally Hamlet by Hamlet. West Cloud 5195, by Abdallah West, dam (the dam of Black Cloud) by Pilot Walker and Happy West 5414, by Happy Medium, dam Mamie West by Allie West. These four highly bred horses are offered for public service on terms especially favorable to intending breeders.

THE Clairview Stock Farm desire special attention called to their new advertisement on the outside cover page of this issue. It is of interest to all admirers of the Light Harness Horse. Send for their catalogue and read it carefully.

THE announcement of the Tuscarora Stock Farm, C. M. de Garmendia, proprietor, Frederick county, Md., for 1892, should attract special attention from intending breeders, and those wishing to purchase high-class trotting stock. Sea King, 11775, by Lord Russell; Monocacy, 9893, by King Wilkes; Tuscarora, by Sea King, and Kioto 3008, by Marmion Golddust, are a quartette of first-class stallions. Look carefully over the advertisement and send for catalogue.

CAMPBELL'S HORSE FOOT REMEDY is one of the standard preparations for the cure of all diseases and afflictions of the hoofs and feet, and is used by the majority of the prominent horse owners and drivers throughout the country. The page advertisement in this issue of the MONTHLY, gives full particulars, including price. Address James B. Campbell Co. 414 West Madison street, Chicago.

The Standard.

AS REVISED AND ADOPTED BY THE AMERICAN TROTTING REGISTER ASSOCIATION, MAY 19, 1891.

IN order to define what constitutes a standard-bred horse and to establish a BREED of trotters and pacers on a more intelligent basis, the following rules are adopted to control admission to the records of pedigrees. When an animal meets the requirements of admission and is duly registered it shall be accepted as a standard-bred animal:

First. Any Trotting Stallion that has a record of two minutes and thirty seconds (2:30), or Pacing Stallion that has a record of two minutes and twenty-five seconds (2:25), or better, provided any of his get has a record of 2:35 trotting, or 2:30 pacing, or better; or provided his sire or dam is already a standard animal.

Second. Any mare or gelding that has a trotting record of 2:30, or pacing record of 2:25, or better.

Third. Any horse that is the sire of two trotters with records of 2:30, or two pacers with records of 2:25, or one trotter with a record of 2:30, and one pacer with a record of 2:25, or better.

Fourth. Any horse that is the sire of one trotter with a record of 2:30, or one pacer with a record of 2:25, or better, provided he has either of the following addit onal qualifications: 1.—A trotting record of 2:35 or a pacing record of 2:30, or better. 2.—Is the sire of two other animals with trotting records of 2:35, or pacing records of 2:30, or one trotter with a record of 2:35, and one pacer with a record of 2:30, or better. 3.—Has a sire or dam that is already a standard animal.

Fifth. Any mare that has produced a trotter with a record of 2:30, or pacer with a record of 2:25, or better.

Sixth. The progeny of a standard horse when out of a standard mare.

Seventh. The female progeny of a standard horse when out of a mare by a standard horse.

Eighth. The female progeny of a standard horse when out of a mare whose dam is a standard mare.

Ninth. Any mare that has a trotting record of

Digitized by Google

2:35, or a pacing record of 2:30, or better, whose sire or dam is a standard animal.

The following circulars have been sent to all stockholders of the American Trotting Register Association:

CHICAGO, ILL., March 13, 1892.

To THE STOCKHOLDERS,

Gentlemen—The Annual Meeting of the stockholders of this Association, which is to be held at the Auditorium Hotel, Chicago, at noon, April 6, 1892, will elect a Board of Directors, which will have the management of the business of the Association. At this meeting it will be proposed to alter, amend and add to the By-Laws generally, as may be deemed necessary and expedient by the stockholders present.

It will also be proposed to alter, amend and add to the rules governing the Standards, and to define more clearly the qualifications necessary for admission thereto.

It will also be proposed to discuss and act on matters relating to the application of the rules governing the Standards.

This meeting will be a very important one to the Association in many ways, and it is, therefore, very desirable that all the owners of its stock be present in person, as many questions that will tend to affect the value of their property will be there brought up for consideration and determination.

Respectfully,

W. R. ALLEN, *President.*

SECRETARY'S OFFICE.

CHICAGO, ILL., March 1, 1892.

Dear Sir—The Annual Meeting of the Stockholders of the American Trotting Register Association will be held at the Auditorium Hotel, Chicago, Ill., on the 6th day of April, A. D. 1892, at 12 M., for the election of officers and the transaction of such other business as may be properly presented. It is desired that every Stockholder be represented, as matters of importance will doubtless come up for consideration and action. Should you find it impossible to attend, please execute the inclosed proxy and give it to some person who will be in attendance, as a full representation is in every way desirable.

Hoping you will find it convenient and agreeable to be present, I remain

Very respectfully,

J. H. STEINER,

Secretary and Registrar.

Volumes X and XI.

VOLUME X of the American Trotting Register is now ready for delivery, and will be sent immediately to all who have ordered and paid for it. Those wishing Vol. X should send in their orders at once, as the first edition is somewhat limited, and the rule will be "first come, first served." Volume X is a book of nearly 750 pages, containing stallions numbered 13887 to 16381. Standard mares and geldings and the non-standard department in all pedigrees to the number of about eleven thousand. Price, $5 postpaid.

Volume XI of the American Trotting Register will be closed on May 1st. All pedigrees received on or before that date will be inserted. Volume X is now ready for delivery.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal.* The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ACIREMA 18567, (6) b h foaled 1889; by Action 2861; dam Tox, by Mambrino Dix, 2081; g d Sue Hopkinson, by Jupiter Abdallah 189. [See Tox, Vol. VI.] Bred by M. T. Quimby, Boston, Mass.; passed to E. B. Bullock, Attleborough, Mass.; then to L. A. Quimby, Boston, Mass. [Vol. XI.]

PANACEA, b h foaled 1886; by O. A. C. 2072; dam by Chicago Volunteer 2611, etc. [See Vol. X.] Passed to John Wilson, Windsor, Ont.; then to Andrew W. Imrie, Detroit, Mich.

PHALLA, (6) b m foaled 1885; by Phallamont 3175; dam M'liss, by Athlete 715, etc. [See Vol. VII.] Passed to Joseph Downey, Chicago, Ill.

PINDAR 15021, (6) b h foaled 1890; by Hambrino, 820; dam Cambria, by Middletown Chief 6163, etc. [See Vol. X.] Passed to I. Quick & Sons, Bement, Ill.

PLUTELL 14710, (6) br h foaled 1890; by Pluto 1950; dam Intrigue, by Princeps 536, etc. [See Vol. X.] Passed to Joseph A. McKinney, Otterbein, Ind.

PRINCE GALLITZIN 8704, (7) b h foaled 1884; by Volunteer Star 1614; dam Lize Giltner, by Baker Pilot 7782, etc. [See Vol. VII.] Passed to J. B. Houseman, Fayette City, Pa.

PRODUCT, (7) ch m foaled 1890; by Code 1834; dam Rosa Gould, by Intrigue 3029, etc. [See Vol. IX.] Passed to Konover & Boyd, Trenton, N. J.

QUEEN, (7) b m foaled 1887; by Almolite 3275; dam Queen, by Alarm 16224, etc. [See Vol. VIII.] Passed to Thomas H. Jones, Howe, Neb.

QUEEN ADDIE, (7) b m foaled 1888; by Adjuster 11390; dam Betty B., by Red Eagle 872, etc. [See Vol. X.] Passed to C. A. Swisher, Hebron, Ohio.

RED ROSE, (7) ch m foaled 1887; by Mambrino Startle Bonner 4801; dam Nettie F., by Smuggler 927, etc. [See Vol. VII.] Passed to Mitchell Stock Farm, Martinsville, Ind.

ROXANIA, (6) bl m foaled 1890; by Ambassador 1496; dam Roxie McGregor, 2:20¾, by Robert McGregor 647, etc. [See Vol. IX.] Passed to Charles T. Luthy, Peoria, Ill.

RUBYLYN, (6) b m foaled 1890; by Lyndon 4824; dam Ruby Wilkes by Red Wilkes 1749. etc. [See Vol. IX.] Passed to Cyrus Lukens, Philadelphia, Pa.

SCARLET BOY 14813, (6) br h foaled 1890; by John G. 6470; dam Lida B., by Harrison Chief 3841, etc. [See Vol. X.] Passed to A. J. Greene, Gallipolis, Ohio.

SHACKLEFORD 9370, (6) b h foaled 1881; by Capoul 1037; dam Abutillon, by Belmont 64, etc. [See Vol. VIII.] Passed to Jacob Treasher; then to J. Mercer; then to Charles E. Mercer, Sterling, Ill.; then to Albert Tiebrantz, Milwaukee, Wis.

SHADELAND IOLA, (7) b m foaled 1890; by Wilkes Nutwood 8000; dam Dora Hull, by Hull 1289. [See Vol. IX.] Passed to C. A. Wever, Martinsburg, W. Va.

SHADELAND NORAMBER 13762, (6) gr h foaled 1889; by Normaneer 5444; dam Amber, by Satellite 2500, etc. [See Vol. IX.] Passed to C. A. Wever, Martinsburg, W. Va.

SHAWBERT 11010, (6) br h foaled 1888; by Shawmut 964; dam Electra, by Egbert 1136, etc. [See Vol. VIII.] Passed to John R. Ferguson, Stamping Ground, Ky.; then to H. L. Sheaffer, Ephrata, Pa.

SIGVALD 13564, (6) b h foaled 1889; by Superior 3780; dam Binbrooke Maid, by Highland Boy 1320, etc. [See Vol. IX.] Passed to C. E. Tanner, Blyth, Ont. Can.

SKOKOLEEN, (6) br m foaled 1890; by King Rene 1278; dam Dhuldul, by Dictator 113, etc. [See Vol. X.] Passed to J. W. Lockwood, Loveland, Ohio.

SWANANNOA, (7) b m foaled 1885; by Melville Chief, 2353; dam Lucy L., by Woodburn Hambletonian 1639, etc. [See Vol. VIII.] Passed to John L. Penn, Danville, Pa.

TASKER 16045, (6) b h foaled 1888; by Red Wilkes 1749; dam Minnie Helm (dam of Zembia 2:19), by American Boy, son of American Clay 34, etc. [See Vol. X.] Passed to F. R. Emerick, Ypsilanti, Mich.

VALENTINE SPRAGUE 15126, (1, 6) bl h foaled 1884, by Gilbirds Sprague, 2715; dam Fleda, by Hambletonian (Grant's), etc. [See Vol. X.] Passed to Doan Bros., St. Louis, Mo.

VERONA, (6) b m foaled 1889; by Fayette Wilkes 2036; dam Vivian, by Gen. Knox, 140, etc. [See Vol. IX.] Passed to E. & F. Ridgely, Springfield, Ill., then to S. B. Rowe, Groton, S. Dak.

VIRA, (7) br m foaled 1891; by Dunton Wilkes 7608; dam Vixen, by Adrian Wilkes 6560, etc. [See Vol. X.] Passed to Henry Plumb, Des Moines, Iowa.

WILLIAM B. 16177, (1, 6) b h foaled 1881; by George Sprague 5606; dam Madam Golddust (dam of *Indianapolis Boy*, pacing record 2:20¼), by Brilliant Golddust 7699. [See Vol. X.] Passed to Claude O. Ellis, Fairfield, Ill.

TERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

BLUE BLOOD AT PEORIA.

THE animals mentioned in the following sketch are owned by Charles T. Luthy, of Peoria, Ill., the wholesale implement dealer, who has, by purchase and breeding, collected a limited number of most richly trotting-bred animals as a nucleus for a breeding farm. With due consideration of the theory of breeding, that is, that it is progressive, that a good son or a good daughter will be better than its sire and its dam, a critical examination of the pedigrees of three or four of Mr. Luthy's young animals will irresistibly lead to the conclusion that they are about as choicely bred as anything living to-day. He has laid his foundation in the blood of Hambletonian, whose family as clearly surpasses all others as a high mountain peak towers above the foothills. This is a fact confirmed by the recorded experiences of the American trotter. Mr. Luthy began to study blood lines some six years ago, and soon came to the conclusion that as George Wilkes was king of performers in his day, then king of sires, so in turn he will lead all others as a progenitor, and that from the manner in which the Electioneers were then coming, Electioneer would in all probability prove to be phenomenal. He accordingly purchased an Onward and a Baron Wilkes' filly and, three years ago, bred them to St. Bel, that magnificently bred son of Electioneer and Beautiful Bells. His subsequent purchases and breeding were in harmony with this. The animals are as follows:

1. Blue Blood, whose picture appears on the first page, was selected, because of his great race-horse inheritance through both sire and dam. As he has for a sire Baron Wilkes with a record of 2:18, and for a dam, Mary A. Whitney, with a race record of 2:28, this, of itself, should give Blue Blood prominence; but when it is further considered how much more backs him up, then it looks doubtful whether there is indeed a young Wilkes stallion living that by breeding is his superior if his equal. Baron Wilkes won the fifth, sixth and seventh heats of a race, the last in 2:18½, and his next and last race in 2:20¾, 2:18¾, and 2:18. He was sired by the great George Wilkes, 2:22, whose wonderful achievements and history the trotting world knows by heart. Baron Wilkes' dam, Belle Patchen, 2:30¾, was sired by Mambrino Patchen, and her dam was Sally Chorister, the only mare, living or dead, that has two trotters in the 2:20 list, both of which have trotted thirty-seven heats or more in 2:30 or better. Mary A. Whitney was raced, but not for a record, and her mark of 2:28, creditable as it was when made, was no measure of her speed. She is the greatest daughter of Volunteer, who is proven by the records to be the greatest sire of game race horses. Aurelius' contribution to WALLACE'S MONTHLY in February, 1889, shows that, of the great sires, Volunteer's 2:30 performers averaged over twenty-seven winning heats, while the performers of the other sires nearest approaching him averaged less than fifteen. As, therefore, Blue Blood is by Baron Wilkes, 2:18, that game, fast and admirably bred son of the great George Wilkes, and out of that game performer, great producer and greatest daughter of the great Volunteer, Mary A. Whitney, 2:28, that has already three in the 2:30 list, and whose dam Peggy Slender also has two in the 2:30 list, it is apparent that he is unmistakably one of if not the best bred young Wilkes

Digitized by Google

stallions of to-day. He is of fair size, a nice bay with dark points, good sense, good disposition. and is nearly perfect in his make-up. He has shown $\frac{1}{8}$ in 17 seconds and barring accidents should take a creditable record. Col. Stoner, the eminent breeder, stated to Mr. Luthy, that he thought Blue Blood was the most promising colt he ever raised; that he felt, in case of the Baron's death, that Blue Blood was the only colt he had that could take the Baron's place; and, that although often solicited to do so, he had never set a price on the colt until he sold him to his present owner. Bred as he is, Blue Blood should certainly sire speed, courage and stamina of a very high order.

2. Belward is an Electioneer-Wilkes top cross. He is a beautiful bay with Onward markings, and, when twenty months old measured scant fifteen hands and weighed 920 pounds. He is individually about as good as his breeding. At rest or in motion, take him any way, he is a horse, and wins the admiration of all. Instead of tracing Belward's blood in diverging lines back to remote sources, Mr. Luthy has deviated from the beaten path, and, in his published cards, begins with the third generation of ancestors, shows their greatness, and then, with characteristic ingenuity, traces their blood, with all its subsequent accretion of power, down through their confluent channels till they unite in Belward and proves him to be one of the most wonderful and powerful focal centers of trotting inheritance. As this method is not very common, the readers of the MONTHLY will not think it amiss here to insert this tracing with such changes as are necessitated by the past year's events. The breeding of Belward will thus appear as follows:

"Hambletonian is the greatest of all trotting progenitors, Green Mountain Maid the greatest brood mare; their greatest son is Electioneer. The Moor is one of the greatest progenitors of early and extreme speed, Minnehaha one of the greatest brood mares, their greatest daughter is Beautiful Bells. Electioneer is the most uniform and greatest sire of early and extreme speed, Beautiful Bells is one of the greatest brood mares; their leading son is St. Bel. St. Bel is the sire of Belward.

"George Wilkes is next to the greatest trotting sire and next to the greatest progenitor, Dolly is one of the greatest and till a year ago, the only mare that produced four trotters, all by different horses; their greatest son is Onward. William Rysdyk (sire of Robert Rysdyk, 2:13¼), placed in the stud in his old age, is proving a worthy son of Hambletonian, a daughter of Amos' Clay and half sister to American Girl, 2:16½ (and with 150 heats in 2:30), is great for a remote dam; their greatest daughter is Griselda. Onward is one of the greatest trotting sires and the greatest progenitor for his age, Griselda is already a great brood mare; their greatest daughter, in the manner she is bred, it is believed, will be Palfrey, a three-quarters sister of the sire of Athadon, holder of the world's yearling stallion record (2:27¾). Palfrey is the dam of Belward.

"Five of his seven nearest dams have contributed twenty-five trotters to the 2:30 list; four of these will probably add more. If his promising young dam, as is believed will be, should be added to this list, then all but one of his seven nearest dams will be great brood mares, four of them among the greatest of all dams. His seven nearest sires have contributed 258 trotters to the 2:30 list, they will add many more. Six of the seven of his nearest sires are among the most noted of the world.

"The sire of Belward is full brother to Bell Bird (one year) 2:26¾, and half brother to the holders of the world's two-year-old, three-year-old, four-year-old, five-year-old, the world's stallion and the world's best records. His dam is three-quarters sister to the sire of Athadon (one year) 2:27¾, holder of the world's yearling stallion record."

3. Baron Bel (by St. Bel) is a little younger and smaller than Belward. He is a fast black, with luxuriant mane and tail, and is as handsome as he is interesting. On account of his strong speed-inheritance this colt will bear watching. His dam is by Baron Wilkes, 2:18. Second dam Daisy Blackwood, 2:29¼, by the great Blue Bull. All of Baron Bel's six nearest ancestors were speedy except his promising young dam that acts like a trotter and will be developed. His four-

Digitized by Google

teen nearest ancestors are all producers but two, which are likely to be producers, and every animal is standard for four generations; so that if equally well mated his produce will be thoroughbred trotters. Space will not permit to enter into details regarding his breeding, but as he is an Electioneer-Wilkes cross, through St. Bel and Baron Wilkes, 2:18, it is a question which is better bred he or Belward, his half brother.

4. Rio Grand, a yearling, is by Sphinx, dam Palfrey, by Onward. Therefore, substituting Belmont for the Moor, Waterwitch for Minnehaha, Sprite for Beautiful Bells, and Sphinx for St. Bel, he is otherwise bred just like Belward, and is a good individual and a natural born trotter.

The brood mares are as follows:

5. Palfrey, b m, by Onward, 2:25¼; dam Griselda, with two trotters in the 2:30 list, by William Rysdyk. Sire of Robert Rysdyk, 2:13¼.

6. Batrina, bl m, by Baron Wilkes, 2:18; dam Daisy Blackwood, 2:29¼, by Blue Bull.

7. Roxania, bl m, by Ambassador, 2:21½; by George Wilkes, 2:22; dam Roxie McGregor, 2:20¾, by Robert McGregor, 2:17½.

8. Bay Mare, by Baron Wilkes, 2:18; dam Daisy Blackwood, 2:29¼, by Blue Bull.

9. Queen of the West, by Baron Wilkes, 2:18; dam Elfie, by Enfield, 2:29. Second dam with two in the 2:30 list.

10. Artless, b m, by Warlock, son of Belmont and Waterwitch; dam by Nutwood, 2:18¾; son of Belmont and Miss Russell, second and third dams producers. Artless inherits the blood of the two great Pilot Jr. mares, Miss Russell and Waterwitch.

11. Brown Mare, by Baron Wilkes, 2:18; dam Brownie, with one in the 2:30 list, by Daniel Lambert, second dam with two in the 2:30 list.

12. In addition to the foregoing the list embraces Huntington 7344, b h, by Gov. Wilkes; dam Lady Almont, by Almont Sentinel, second dam by Alburn, etc. This horse has been reserved on account of his style and beauty, and if he imparts his individuality to his produce they should prove desirable roadsters.

Although Mr. Luthy's collection embraces but few animals, it will be seen that he is aiming high. In addition to his care in selecting good individuals he has paid such attention to their breeding as to avoid the mistake that so many make of having to dispose of them, after having wasted years of time, and to begin all over again. His brood mares are all choicely bred and mated with any of his young horses; their produce, if individually right, should be good enough for a place on any farm. The stock is in charge of Mr. W. M. Byington, formerly of Chicago, by whom it will be developed.

From the manner in which Mr. Luthy has started and is proceeding, it will be surprising if his breeding venture should not prove successful, and Peoria and its vicinity should be congratulated on having in its midst animals so choicely bred, and particularly the young horses, than which there are few, if any better.

THE METHODS OF PALO ALTO.

BY S. T. H.

III.

NOTWITHSTANDING the success of Palto Alto, in producing the fastest trotting stallion in turf history out of a thoroughbred mare, the breeding public has not yet endorsed the theory, to any extent, that such an animal will become a prepotent trotting sire. Indeed the only three distinguished breeders that have shown their faith by their works in this strong infusion of thoroughbred blood in trotting lineage are the Messrs. Miller & Sibley and Mr. Robert Bonner. The former are accumulating in quantity and quality a collection of trotting-bred horses second to no other breeding establishment, and the latter, since 1867, has been the owner of the kings and queens of the trotting turf, with the single exception of Goldsmith Maid. Not overlooking in this statement the supremacy

Google

of Jay Eye See, for a single day. This is not strange, but the exemplification of consistency, when it is remembered that he was the owner of the half-bred Edward Everett, during the last nine years of his life; that he now offers the services of his son, Eldridge, to the public; and that he has repeatedly presented his views that thoroughbred blood, under the proper conditions, notably that of Lexington, mingled kindly with the trotting pedigrees, in which Hambletonian lineage predominated. But the purchases of the other great trotting breeders are not in line with these breeding principles of Palo Alto. Although it now has twenty-two half-bred sires on the place, six of which have made standard records ranging from 2:29¾ to the stallion championship of 2:08¾, yet the leading Kentucky trotting establishments that have secured sons of Electioneer like Woodburn, and Highland farm, and South Elkhorn, and the prominent trotting-horse stock farms of other states, such as the Village farm of New York, and the Allen and the Forbes farms of Massachusetts, the Stout farm of Iowa, and the Prospect Hill farm at Franklin, Pa., which has been happily called the Palo Alto of the East, and many more places, whose mention would become tedious, one and all have preferred Electioneer colts out of trotting-bred mares of trotting, speed-producing records as deeply inbred, with as many trotting outcrosses as possible. Some breeders have preferred Electioneer colts thus bred, without any records, to the half-bred Electioneers with splendid turf performances to their credit. It is in vain that the Palo Alto Catalogue annotates the superior qualities of these half-bred stallions. Azmoor is described therein as "a horse of high form, nice "gait, good bone, substance and muscle, "combined with the best of dispositions." "Palo Alto," as "one of the finest look-"ing stallions anywhere, and a natural "trotter. As a two-year-old he showed "a public trial in 2:23¾; as a four-year-"old he started nine times against aged "horses, won eight races, and took a "record of 2:20¼. At Chicago, when "eight years old, he defeated Jack, in "straight order, in 2:18¼, 2:15, 2:13, "giving him the fastest race record, and "the fastest three heats won in a race by "any trotter." To these splendid triumphs can now be added the climax, that as a nine-year-old he won the champion stallion record in 2:08¾! Yet, when Mr. Alexander, "through the kind-"ness of Gov. Stanford, was enabled to "breed the dam, and two sisters of Maud "S., 2:08¾, a sister to Nutwood, 2:18¾, "and the dam of Pancoast, 2:21½," he did not send them to the nonpareil half-bred Palo Alto, but to his trotting-bred sire Electioneer. The produce was six fillies and three stallions. The official catalogue of Woodburn concludes: "*From the blood of Electioneer, obtained* "*through such sources, we expect great* "*results, when mingled with the blood of* "*Hambletonian, Mambrino Chief, Pilot* "*Jr. and the thoroughbred that is found* "*so strongly represented in the Wood-* "*burn pedigrees.*" The thoroughbred strains mentioned last, as properly remote at Woodburn, are in the grandams of the matrons, not in the sires, and the produce of these Electioneer colts, therefore, will merely have the remote or foundation thoroughbred cross that is fashionable in Kentucky. Col. Russell, of Milton, Mass., was negotiating for Ansel, the half-bred son of Electioneer, but finally preferred, at a larger price, Edgemark, 2:16, the inbred Hambletonian and inbred Clay, son of Victor Bismark, by Hambletonian, dam Edgewater Belle, by Edgewater, son of Hambletonian. Col. Pepper passed over these brilliant half-bred sons of Electioneer and selected his son, Norval, then without a record, and disabled by early training, because his dam, Norma, by Alexander's Norman, was trotting bred. J. Malcolm Forbes, the prince of trotting-horse buyers, ignores Palo Alto and Azmoor, and Whips for Arion, not only because of his phenomenal two-year-old record, but because he was sired by Electioneer, the greatest of dead trotting sires, and his dam, the inbred Hambletonian Manette, was sired by Nutwood, the greatest of living trotting sires; second dam Addie (the dam of Woodnut, 2:16½, and Manon, 2:21, by Hambletonian Chief son of Hambletonian 10); third dam Manton, by Sayre's Harry Clay, from which trotting family came

Digitized by Google

the dams of Electioneer and George Wilkes.

C. J. Hamlin, who is making a brilliant stock record with the superb stallion, Mambrino King, second only to that of Charles Backman with that other distinguished Mambrino sire, Kentucky Prince, is the remarkably successful breeder and owner of the three intensely trotting-bred performers, Belle Hamlin, Globe and Justina, all by Hamlin's Almont, and two out of one daughter, and the other out of another daughter of Hamlin's Patchen, that trotted abreast, after the fashion of the Orloff trotters of Russia, in 2:14. He, too, passes over the half-bred entire sons of Electioneer at Palo Alto, and enriches his splendid collection of over three hundred trotters, by selecting for the stable companion of his great trotting sires Mambrino King and Hamlin's Almont, the Electioneer colt, Chimes, not because his record is as brilliant as the standard sons of Electioneer out of thoroughbred mares, for it is only 2:30¾, but because he is purely trotting bred, containing inbred crosses of Hambletonian and Clay, with Pilot Jr. and Mambrino Chief outcrosses. His dam is the famous daughter of The Moor, known as Beautiful Bells, the dam of Bell Boy, record at three years, 2:19¼, and Hinda Rose at three years, 2:19⅓, and Palo Alto Belle at three years, 2:22½, and Bellflower, 2:24 at two years, and Bell Bird, 2:26¼ at one year, and St. Bel, 2:24½ at four years of age.

The Messrs. Miller and Sibley, of Franklin, Pa., advertise six stallions by Electioneer, three of them, Electric Bell, Cecilian and Belsire, out of trotting-bred dams, and the remaining three, "Ah There," "Ivo" and "Outcross," out of dams by thoroughbred sires that have mingled their blood successfully in trotting performers. Yet the fact is significant that the trotting-bred trio are advertised as private stallions, while the three latter are each offered to the public at the minimum service fee of Electioneer's sons, $100. Thus the concensus of opinion among the trotting-horse breeders of the continent is strongly adverse to this method of Palo Alto in using half-bred sires for trotting purposes. The general verdict of the trotting-horse community coincides with this opposition as exemplified in the discriminating prices in the extensive sale of trotting stock bred at Palo Alto, sold in January of this year, at the American Institute building in New York City. There were offered five yearling colts by the half-bred Palo Alto, that sold for $5,815. None of them were out of half-bred or even quarter-bred mares. The dams of all but one were the daughters of the inbred Hambletonian sire, General Benton, who not only scored a race record of 2:34½, but who sired Sallie Benton, the first four-year-old trotter to win a record better than 2:18. Jefferson Prince, his full brother, is the sire of five standard trotters, with records ranging from 2:19¼ to 2:29¼, in actual races. The other Palo Alto colt there offered for sale has for his dam Lizzie Collins, bred by A. Stansifer, Boone county, Ky., sired by Stansifer's Woful, running back to Long Island Black Hawk. She was so exceedingly promising, as a three-year-old trotter, that she was purchased for the Palo Alto ranch and trained for speed, after she was transported across the continent. It is to be further noticed that all of these Palo Alto yearlings are just the same age as Bell Bird, by Electioneer, out of the trotting-bred mare, Beautiful Bells, who made, at one time, the best yearling record of 2:26¼ in 1891; that they have all been broken to single and double harness; that they are all entered in the great stakes for three and four-year-olds of 1893–94; that their speed, therefore, has been to some extent tested: and that they were sold with these rich engagements without limit or reserve. At the same sale eleven colts, by his pure-bred trotting sire, Electioneer, all two years old and out of trotting-bred dams, with one exception, and like the Palo Alto colts, all without a record, sold for $70,575. *To make the comparison more forcible, the average of each Electioneer colt was $6,415, being $600 more than all the Palo Alto colts sold for together.* This enormous difference in price may be partially accounted for from the facts that Electioneer is the greatest producing sire in trotting annuals, while his son, Palo Alto, has not yet presented a single standard performing trotter; that Plover,

Digitized by Google

Tiston and "Lot 29," of the Electioneer colts are out of dams in the great broodmare list; but still the fair deduction from the array of facts heretofore presented is, that the horse community at large thus plainly discriminates between pure and mixed trotting progeny, and thereby forcibly indicates to the management of Palo Alto that this infusion of thoroughbred blood into the trotting lineage at the present advanced stage of the breeding problem is, in the public estimation, palpably retrogressive, harmful, and, in every phase to be positively deprecated. Before this solid phalanx of mighty, united opposition, Palo Alto opposes itself with the confidence of ultimate victory. The limited uses of half-bred horses at Tarrytown and Prospect Hill are only sufficient to render the co-operation locally potential on two out of the hundreds of trotting-stock farms. The allied forces of theory and practice are thus almost unanimously arrayed against this method of Palo Alto in producing trotting sires. Turf editors denounce it as the certain means of delaying the crystallization of the trotting horse into a type without adding materially to his speed or to his stamina. Pedigree makers repudiate it as practically going backward, and by beginning *de novo* actually losing most of the progress gained by the expensive experiments of the past fifty years. Turfmen object to it because they claim that the average half-bred sire is not reliable as a race horse, and that in his produce, when the heated currents of the blood rush to their excited brains, the stronger element in their composite lineage—the ambition to gallop—will assert itself despite the restraints of shafts and harness. They have universally contended, as the insuperable practical objection to the half-bred horse on the trotting turf, that when a steady purely trotting-bred horse of equal speed in closely contested heats can not be shaken from their throat latch, they will frequently rush headlong into a disastrous break, because the gallop is the faster gait transmitted to them by their more royal ancestry. In response, Senator Stanford can cite the instance of Edward Everett. His progeny did not show this alleged failing. His sons, Fullerton, Everett Ray and Hambrino, were trotting honesty personified, and when his grandson, Delmarch, in his memorable race with Allerton at Lexington, in the autumn of 1891, was overmatched in speed by the mightiest of race stallions of that year, down the home stretch, he contested every inch of the distance in every heat without showing the least inclination to leave the trotting movement for the faster gallop. Palo Alto is a still more brilliant example. Like all high-bred horses, he requires more work to bring his great ambition under absolute control, but when it is thus measurably subdued, his contests show that he was perfectly reliable in all of his remarkable races. Thus, when only four years old, he won eight out of his nine races against aged horses, and only lost the one to the speedier Wilton, two years his senior, to whom he was second. Still the instances on the turf of this method of breeding are not yet sufficiently numerous upon which either side can predicate a general conclusion. Statistics, as far as they can be impartially construed, indicate that the quantity will fall far below the quality; that the extreme speed will be greatly in excess of the average number of standard performers, in comparison with those strictly trotting-bred in their pedigrees. This conclusion is the result of a careful annotation of trotting sires in the Great Table of the Year Book for 1891. By including some whose dams may not be thoroughly established as strictly thoroughbred, the entire list, excluding Edward Everett, comprises only thirteen, as follows:

1. Rysdyk, sired by Hambletonian; dam Lady Duke, by Lexington; grandam Magdalene, by Medoc. He has sired only seven standard trotters, but has produced extreme speed, as in Clingstone, 2:14.

2. Almonarch, 2:24¾, by Almont; dam Hi, by Asteroid; grandam by imp. Scythian. He has presented only five standard performers, but extreme speed, as in Elmonarch, 2:15¼.

3. Almont Boy (Paschall's), by Almont Jr. 1764; dam the McEwen Mare, by Torpedo, son of Childe Harold; grandam Molly, by Hamlet, son of Consul. His contribution to the standard is

Digitized by Google

only three in number, but of these Aline has a record of 2:16 and Dallas of 2:11½.

4. American Clay, by Cassius M. Clay Jr. 22; dam by imp. Tranby. He, too, has only three in the list, but he sired the dam of Nutmeg, 2:16, and of Hermit, 2:16½, and he begot Magic, the sire of Clemmie G., 2:15½.

5. Ashland, by Mambrino Chief; dam Utilla, by imp. Margrave; grandam by Sir Leslie. Strange to add, his standard performers are also three in number, but he sired the dam of Edwin Thorne, 2:16¼.

6. Cripple (Viley's), sired by Flying Cloud; dam Viley Mare, by imp. Yorkshire. He has sired only one standard trotter, but that one is Belle Brasfield, 2:20.

7. Black Pilot, sired by Roscoe; dam Eugenie, by Swigert's Lexington; grandam by Brawner's Eclipse. He returns to the trio as his number of standard representatives, but among the three is Pilot Knox, 2:19¾.

8. Deucalion, 2:22, by Hambletonian 10; dam Trusty, by Marlborough, son of imp. Trustee; grandam by Henry Duroc. He has doubled the number to six, among which is Leicester, 2:17¼.

9. Ferguson, by George Wilkes; dam Press Forward, by Albion; grandam Belle Martin, by imp. Sovereign. His representatives number six and the speediest is Victorine, 2:22.

10. Peck's Idol, by Mambrino Chief; dam by American Eclipse. He has five standard performers, of which Don leads with a record of 2:22½. But he sired the dam of Stratian, 2:21¾, and of Misty Morning, 2:21.

11. Jim Monroe, sired by Alexander's Abdallah; dam Lizzie Peebles, recorded as "said to be by Wagner," but that the "said to be" ought to be stricken out, any one who has seen her and knows the integrity of her owner would have no question. He has sired eight, of which Monroe Chief, 2:18¼, and Kitty Bates, 2:19, are the best. He also sired the dam of Emma, 2:16¼.

12. Patchen (King's), sired by Young Red Rover; dam Fan, by imp. King of Cymry. He has but one representative, but that one is Patchen, 2:18¾.

13. Seneca Patchen, 2:38, sired by George M. Patchen 30; dam Toot, by Holenbeck's Sir Henry, son of Henry, by Sir Archy; second dam by Seely's Eclipse, son of American Eclipse. He has eight standard performers, two of which are Sunrise Patchen, 2:19¼, and Sunset Patchen, 2:18¾.

But the cases in point as far as speed is concerned uphold Senator Stanford rather than the opposition. The experiment which he proposes to test to its extreme limit, both in the harem and on the race track is invaluable. At the very worst it can not be regarded as an unmixed evil. Even at Palo Alto the pure trotting-bred method of producing trotters is being carried on contemporaneously with the half-bred system. The perfection of trotting lineage at that leading farm, therefore, is not thereby being seriously delayed. The other great breeding establishments, Village farm, for instance, that has one hundred and twenty trotting broodmares and only five thoroughbred matrons, are commingling almost exclusively the most fashionable trotting strains, and intensifying them by both judicious in-breeding and approved trotting outcrosses. They are constantly keeping in view developed trotting-bred speed sires and trotting-bred speed-producing dams, till their produce is rapidly bringing about that much-desired consummation, the thoroughbred trotter. If the alleged Palo Alto diversion from the great law that "Like produces its own likeness," is crowned with the dual success of average quantity as well as superb quality, which latter means the ultimatum of extreme speed, then the inference seems to be warranted that the trotting-horse breeders have been pressing on to the formation of the thoroughbred trotter with undue haste before the richest element, the thoroughbred strain, in both the sire and the dam, has been sufficiently incorporated in this composite lineage of the trotting horse. But if the average number fails and the standard performers are few, though gifted with extreme speed, then this further incorporation of thoroughbred blood in the male line will receive no support from the breeders of the trotting horse who prosecute the business for profit. For the primal element of

Digitized by Google

success in the production of every type of the horse from the diminutive Shetlander to the ponderous Norman is uniformity of produce in size, formation, disposition, action, family traits and standard market value. The present position of Palo Alto, therefore, is the crucial test of this method of breeding the trotting horse for all future time. Gov. Stanford seems to appreciate the magnitude of the experiment he is making. Never before has it been attempted on the same well-considered, gigantic scale, under the same comprehensive conditions and upon the assurance of thoroughness from the support of the same magnificent endowment. In the selections of matrons that were stinted in 1891 to these half-bred sires, nothing has been omitted that will insure success. For instance, the half-bred Azmoor, 2:20½, has been mated with such matrons as Abeto (pacing record, four years, 2:28½), sired by Woolsey, full brother to Sunol, 2:08¼; dam Abbess, by Mohawk Chief; second dam Abbie, by Almont 33; third dam Norma (dam of Norval, 2:17½), by Alexander's Norman, sire of Lula, 2:15. The half-bred, Whips, 2:27½, is stinted to such royal trotting-bred dams as Barnes (dam of Gov. Stanford, 2:23¾, at four years old), sired by Whipple's Hambletonian (sire of the dams of Strathway, 2:20, and Dawn, 2:18¾), and of fifteen standard trotters, by Guy Miller, the son of Hambletonian 10, and her dam was sired by Hiatoga's son, Chieftain, sire of the dams of Tempest, 2:17, and Mount Vernon, 2:21.

But Palo Alto has the cream of this unequaled harem—Addie, the dam of Woodnut, 2:16½, and Manon, 2:21, and of Manette, the dam of Sunol, 2:08¼, America, the dam of Benton, five years old, record 2:23¾, and of Bonnie, four years old, record 2:25, and of Almoneer, 2:31½, Bonnie, four years old, record 2:25, sister to Benton, five years old, record 2:23¾, sired by Gen. Benton, son of Hambletonian 10, out of America, by Hambletonian 10, and many others equally rich in blood, performance and produce, have been stinted to this champion trotting stallion, while at the udder of Elaine, 2:20, by Messenger Duroc, the dam of the yearling champion of her day, Norlaine, tugs a splendid colt by Palo Alto, foaled this year, and another one by the same sire follows his dam, Beautiful Bells, the champion trotting broodmare of California. If opportunities, therefore, will insure success in quantity as well as quality the half-bred sires at Palo Alto have the most brilliant means for the demonstration. In the whole range of trotting history Senator Stanford could not have selected for the sire of his half-bred stallions a more powerfully prepotent horse than Electioneer. Piedmont would probably have been a signal failure, and so would have proven the other sires at the ranch, Gen. Benton and Nephew, for they have had only moderate success with trotting-bred mares and, with the single exception of Gen. Benton, when mated with Dame Winnie, absolutely no success with the thoroughbred mares that to the embrace of Electioneer dropped standard trotters. He is not only fortunate in possessing the most successful trotting sire for his half-bred experiment, but the most prepotent combination of trotting-blood elements in the lineage of that sire. The quality and quantity of the offspring proclaim the Hambletonian and Clay union to be the most controlling combination upon all outcrosses, be they pacing or thoroughbred, and the most positive success is based upon the Hambletonian being the sire and the Clay the dam—never the reverse. The reason for this arrangement seems to be obvious. The Hambletonian has the trotting ambition and the trotting conformation in the highest degree, while all the branches of the Clay family seem to have that excess of nerve force which insures the best trotting-speed results in the produce. The Hambletonian trotting preëminence is manifest by its overwhelming production of standard performers in the male line through Rysdyk's Hambletonian and his lineal descendants. The Clay vitality, on the contrary, is apparent in the nervous ambition that can be traced from imported Grand Bashaw through the produce of Andrew Jackson and Henry Clay 8 and Cassius M. Clay's 20 and 22 and Harry Clay 45 and George M. Patchen Jr. 31

Digitized by Google

down to their remote descendants of Sultan and Crittenden. Wherever the daughters of the various Clay sires were used, whether in Orange, Ticonderoga or Ontario counties, of New York, or in the states of New Jersey, Massachusetts, Kentucky, Ohio, and of the great west, they were all known as mares of tremendous resolution. Many of them were noted pullers. It was no uncommon habit for them to tug so hard upon the bit in their headlong ambition as to froth at the mouth as if suffering from hydrophopia. Runaways among them was the rule rather than the exception. They generally required a relay of drivers, like the one owned by the well-known Dr. Bennett, of Canandaigua, N. Y., the strongest man in the village, for example, which was so turbulent on the bit that it was his custom after his own strength was exhausted to pass the lines over to his hired man, who always accompanied him to afford a fresh supply of muscular restraint. The secret, therefore, of this superlative potency of the Hambletonian-Clay cross, as exemplified in Dauntless and George Wilkes and Electioneer, undoubtedly can be traced in part to the enormous nerve power of the Clay dams, and the collateral secret is thereby incidentally solved, why the various branches of the Clays are more successful in the maternal than in the paternal lines. If, therefore, success is possible with any half-bred sire, Palo Alto has undoubtedly in his lineage on the sire's side the greatest possible prepotency for the demonstration.

11. The warrant of triumph is very much more demonstrable in the second pronounced method of producing trotters which prevails extensively at Palo Alto, namely: *The mating of intensely trotting-bred sires with thoroughbred matrons to produce great trotting performers from the first cross.*

The statement has been so often made that this experiment was thoroughly tried at Woodburn, and signally failed, that it has been accepted as an historical fact. But it is totally erroneous. The test has never been intelligently made on a comprehensive scale anywhere in America. Ethan Allen was largely bred to blooded mares in his old age, from his twenty-first to his twenty-sixth years, on the stock farm of Sprague & Akers, near Lawrence, Kas. But he was not a prepotent sire in the strong sense of the term, nor was he purely trotting-bred, the pedigree of his dam never having been established, nor was the progeny ever carefully or systematically developed, owing to the untimely death of Mr. Akers and the consequent scattering of the stock.

Mr. L. Brodhead, the able manager of Woodburn, in a communication to the Kentucky Stock Farm, of July 10, 1890, referring to the use of thoroughbred mares, makes this official statement: "The original idea of breeding thorough-"bred mares to trotting stallions was to "breed fillies for broodmares, and (thus to) "build up pedigrees with thoroughbred "foundations. These fillies were bred "young to our trotting stallions, thus get-"ting two trotting crosses on a thorough-"bred foundation. *There was no expecta-"tion of getting phenomenal speed from "the first cross.*"

In another article in the *Live Stock Record* for January 11, 1890, he says: "But little effort was made to develop "their speed, but in what work they had "Miss Russell (dam of Maud S.) was "the fastest of the lot, she trotting in "2:44 as a three-year-old, (1867) very "fast for that date. *As we have what we "bred* (for) *we have no idea of going back "to what was first principles, and breed-"ing all of our thoroughbred mares to "trotting stallions. I have never advo-"cated the thoroughbred to this extent.*"

What, therefore, was never a dream at Woodburn has become a reality at Palo Alto. What was breeding merely to lay a foundation in the thoroughbred grandam for trotting speed, in later generations at Woodburn is the identical breeding for extreme trotting speed, from the very first cross, at Palo Alto. What Woodburn repudiates as *going back to first principles*, and its manager declares he never advocated, to wit, the use of the thoroughbred to the extent of attempting to make thoroughbred mares great trotting broodmares, Palo Alto declares to be not only the first, but permanently, the most successful method of producing great trotting speed. Its

Digitized by Google

owner claims that, superadded to the extreme trotting speed, the thoroughbred dam contributes the stoutness to carry that speed better than if the thoroughbred cross was more remote. This is one of the most pronounced of the advanced methods of Palo Alto, which Senator Stanford proposes to have continued by his munificent endowments of the Leland Stanford Jr. University to the distant future far beyond the span of his own life, when even his "name may be nothing more than a reminiscence among men." He has many facts upon which to base his theory.

Extreme speed has never come from cold-blooded mares, and stamina can not be obtained from a plebian source. The instances of speed, not extreme at best, from such a cross are exceedingly rare. Adjutant, the son of Administrator, dam Lizzie Brinker (the dam of Lucy Fleming, record 2:24½) by Brinker's Drennon, thus rich in blood, sired Review, 2:29¼, out of a daughter of the imported Belgian draft horse, Seneca Chief, while out of Alice M., a pacing mare, he produced Henry S., who has scored a four-year-old pacing record of 2:17¾.

Sultan, full of Hambletonian, Mambrino Chief and Clay blood, produced out of the Gibson Mare, sired by a draft horse, Big Frank, who rolled and tumbled and struggled desperately to overcome his draft-horse inheritance when he made a record of 2:30, but from Fleetwing by Hambletonian, out of Patchen Maid, by the great George M. Patchen, he sired the superb Stamboul, whose record of 2:11 without a break is not the limit of his speed capacity. Abdallah Hambletonian, the well-bred son of Hickory, stands the highest on this undesirable list. He sired, out of Black Bess, an overgrown daughter of the Clyde stallion known as the Ketchum Horse, the trotting mare Granny, that made a record of 2:28. But these meager results, when it is remembered how many thousands of cold-blooded mares have been bred to trotting sires, demonstrate effectually that the common stock of the country can no longer contribute to the upbuilding of the American trotter. Swinging, pendulum like, to the other extreme, thoroughbred mares have sired a high rate of trotting speed. All through the Year Books instances of such thoroughbred dams can be found, like Kate Crocket, by imp. Hooton, the dam of Lula, 2:15, and Lizzie Witherspoon, by Gough's Wagner, probably pure-bred, the dam of Fanny Witherspoon, 2:16¼. From such examples the demonstration obtains that thoroughbred dams assist just as cold-blooded ones hinder in the production of extreme speed. But Woodburn has bred more trotters than the dam of Maud S. out of thoroughbred mares that have shown great trotting performances. Tatler, 2:26, by Pilot Jr., out of Telltale, by Telamon, the son of Medoc, and Dick Moore, record 2:22½, by Belmont, dam Mary, by Monmouth Eclipse, are thus pedigreed. They, too, were produced in the early morning of Woodburn's trotting career.

These instances, in the absence of a systematic test of thoroughbred blood, were sufficient to provoke the radical skepticism, which Senator Stanford maintains, that the trotting instinct was not lodged in Messenger exclusively, among thoroughbreds. The position of trotting-horse breeders, he contends, by his methods, is the one not dictated by experience, but by the *ipse dixit* of a single trotting-horse compiler. It is the *ex-cathedra* dictum, he asseverates, of the author of the Trotting Registers, whose profound researches in pedigree lore led him to the conclusion that imported Messenger was the one solitary instance among the thoroughbred race horses in turf history, that possessed from some mysterious source beyond discovery the true trotting heredity termed by him "trotting instinct." All other trotting families, he contends, till it has become an axiom, have derived their excellence by and through the Messenger cross. Armed with the Laws of Heredity, and their resultant accumulation of potency in succeeding generations, as expounded by Ribot and Darwin, and fortified by the trotting records, which it has been his life work to collect and classify, both as to pedigrees and performances, he has literally dictated to the trotting-horse breeders the necessity of incorporating this exclusive Messenger trotting instinct theory as the foundation of success in

Digitized by Google

their methods, and they have followed his dictation with almost childlike obedience. He has thus directed the making of trotters from his sanctum, and they have, in fact, been made very rapidly by his disciples, on the stock farms of this country during the last decade. Governor Stanford has dared to deny his pronunciamento, proclaiming the exclusive trotting inheritence of imported Messenger. By the list of broodmares in the catalogue of Palo Alto, he affirms that Planet and his sire, Revenue, and his sire, imp. Trustee, that Lexington and imported Hercules and nearly all thoroughbreds produce pronounced trotting action in some of their descendants; that trotting speed, like running speed, comes from warm blood; that there is still too much cold blood in trotting pedigrees, and that a further increase of speed in the trotter must come from deeper and more frequent infusions of thoroughbred blood. For this rebellion he has received as unmerciful excoriations from trotting purists as are decorous in consideration of his great wealth and position. It has been sneeringly said that only a millionaire can afford to indulge in a course of breeding so barren of marketable results. His offense has been portrayed as just as heinous to the well-settled and universally acknowledged laws of inheritence in the community of trotting-horse breeders as high treason is in the estimation of loyal citizenship. The issue is well defined, and the experimental conclusion is fraught with great interest to the trotting-horse student.

Governor Stanford *knows, experimentally*, what is correct trotting action. For ten years he has produced and critically studied the very best trotting action in turf history. He contends that all of the thoroughbred mares used for trotting-brood purposes at Palo Alto were selected "*because they had good trotting action.*" In this he is corroborated by the positive opinion of an expert of no less trotting-horse experience than Mr. Brodhead. In the *Live Stock Record*, above quoted, he adds: "*The thoroughbred is the purest "gaited trotter imaginable.* The trot is "one of his natural modes of locomotion. "He will not leave it except on compul- "sion. There is no mix in his gait. Toe "weights and hobbles are not a necessity "to him. *His ancestors have been trot- "ters for generations. As a consequence "he is an action-controlling horse. "Just in this particular a great error "has been inculcated.*

"It has been argued that Pilot Jr. was "an action-controlling horse, and that "when crossed on to the thoroughbred "he controlled the action and made the "produce trot, when the fact is that the "thoroughbred in Pilot Jr.'s dam con- "trolled the action of old black Pacing "Pilot, and the produce, Pilot Jr., was a "natural trotter, and never got a pacer, "except out of a pacing mare.

"*One not personally acquainted with "the action of the thoroughbred, would "judge, from the arguments of his ene- "mies, that he had been trained for gen- "erations to run, and could do nothing "else. This is a fallacy. It comes from "ignorance of his characteristics. He "is a perfectly pure-gaited trotter. In "many instances he has considerable "speed.*"

Governor Stanford could not have supporting testimony from a higher authority. Is it thus possible that Mr. Wallace has dogmatically dictated to the trotting-horse breeders a monstrous fallacy? Is it a fact that the thoroughbred, as a type, is a perfectly pure-gaited trotter, and that imported Messenger, instead of being exclusively endowed with trotting action and trotting instinct, inherited it, in common with all other thoroughbreds, "who will not leave the trot, as a breed, except on compulsion?" If this is the natural gift of the thoroughbred, what an incalculable loss his exclusion from trotting pedigrees has been since Mr. Wallace issued against him the ban of excommunication in 1871, the date of the first volume of the Trotting Register! If the thoroughbred is, indeed, the purest-gaited trotter imaginable, what an inestimable benefit Senator Stanford, in contradistinction to the Wallace dictum, is conferring at this late day upon the trotting-horse breeders; and what an increased capacity for greater improvement he is endowing the future higher-bred trotting horse with, in his ambition to increase his speed to the two-minute, and, possibly, lower mark! The one remark-

Digitized by Google

able feature about the locomotive habits of the thoroughbred is that he never paces. Mongrel breeding only produces the mixed gaits. The thoroughbred, alone, is obstinate in his trotting persistence. All other classes of horses, especially when subjected to the saddle manipulations, will rack and single-foot and pace. But the thoroughbred, though subjected to the saddle from his earliest inception, both as a breed and as an individual, never paces. Nothing can induce him to leave the trot but the walk and the gallop. Now, if trotting is an heredity, and the thoroughbred, in contradistinction to all mongrel breeds that both trot and pace, is the only horse that has the trot as the intermediate gait between the walk and the gallop, it logically follows that, with him, as a breed, and not as an exceptional individual, trotting is an heredity. If he has this special capacity, which he has preserved without assistance or training, it also follows that this preserved habit can be strengthened and increased by methodical development. Fast trotting is generally conceded to be an acquired habit, or ambition, or instinct. If the thoroughbred has the natural instinct to trot, it follows that the acquired habit of fast trotting can be ultimately engrafted upon his natural, unconquerable inheritance of trotting. The argument from analogy, by which the trotting purists enforce the conclusion of exclusive Messenger prepotency, fails upon a critical analysis. The acquired instincts of dogs, notably the Scotch collie, and pointer are commonly cited as proofs of what exclusive breeding and development will do till they become strong enough to display their peculiarities without further development. This is the fact measurably with the dogs, but never with the trotting horse. He always requires the same patience in handling to make a fast trotter, no matter how deeply he is trotting-bred. As the methods of development begin earlier now than in former periods, even when he is a weanling, and are more scientific, his speed becomes greater, and susceptible of development in earlier colthood. To revert to the dog illustration of acquired instincts, the writer owns a pure Scotch collie, and a Gordon setter full of Blue Belton blood. Their acquired instincts are as remarkable as they are antagonistic. Neither has ever been trained, yet the collie, McIvor, waits patiently at the stable door for the Jerseys to be milked, and, when the last strippings are drawn, he is aware that all is ready for the journey to the pasture. Instantly he is on the alert, and takes an active part in driving them down the road, across a small stream to the pasture several hundred yards away. At the evening hour he knows when it is time to bring the cows home for milking. He fairly begs the herdsman to go if any unusual care delays his starting, and when he says, "Come, Mac, let's go for the cows," the collie darts ahead with instant delight. But the setter puppy never goes with him. She is actually afraid when the Jerseys come near her, but she will wabble, in her weak-legged puppyhood, down to the field where the chickens have their run, and will come to a persistent stand upon some old Brahma hen. With her nose out, tail rigid, and one fore foot raised, she will intently point her, as if the barnyard fowl was royal game, and she herself had been patiently trained thus to transfix her position. Neither dog has the instinctive habit of the other. But such is not the case with the thoroughbred and the trotting-horse. Both of them have the trotting habit. If there is any difference, Mr. Brodhead claims the thoroughbred has the more persistence, on the trot, in the undeveloped state. The law of heredity, therefore, both natural and acquired, which, according to Ribot, "transmits, preserves and accumulates," warrants Governor Stanford, from a biological standpoint, in his use of the thoroughbred cross to further increase the capacity of the trotting horse for speed and endurance. Now to perfect the argument from analogy. If either the collie should show a tendency to point game, or the setter the habit of herding cattle, in the slightest degree, then either one, by careful training, could be developed into the habits of the other. By parity of reasoning, therefore, it would follow, the thoroughbred horse having always the disposition and the habit to trot, could be developed into a confirmed trotter, and having already, as

Digitized by Google

an intense inheritance, the habit of speed, could be trained to extreme trotting speed.

If Mr. Brodhead is correct in his judgment that the pure trotting-gaited thoroughbred corrected the pacing gait in old black Pacing Pilot, that brought his confirmed pacing action with him from generations of pacers, in Canada, what a wholesome power the infusion of thoroughbred blood would have in correcting the ugly, weaving, contentious movement of the alarmingly increasing pacer. Pure trotting-bred parents not only can not extinguish the pace, but they actually produce it, as they increase their speed, with startling rapidity. There seems to be some foundation for this radical position; would that statistics made it impregnable.

Bonnie Scotland, out of Waterwitch (who was full of pacing blood, her sire being Pilot Jr. and her dam Fanny, that paced, by Kinkeads St. Lawrence, that both paced and trotted in three minutes when bought in Canada), produced Scotland, trotting record 2:22½; and as pure in gait as Sunol. Exchequer, the thoroughbred son of Revenue, out of Nina, by Boston, was matched with two pacing mares, and corrected the pacing gait in the produce of both, the one, Lucille, scoring a trotting record of 2:21, and the other, Rigolette, a record of 2:22. Aaron Pennington, the thoroughbred son of Tipperary, out of a daughter of imported Albion, wiped out the pacing proclivities in Calaway Maid, the daughter of Rockaway, by old pacing Tom Crowder, for their issue, Gipsy Girl, is a pure trotter, and made a trotting record of 2:22 at Buffalo in 1887. Thus this statement of Mr. Brodhead, and these facts from the record, become further corroborative in favor of Governor Stanford's use of the thoroughbred; but are they exhaustive and conclusive? Captivating phrases often usurp the place of logical deduction. If there has been a monstrous mistake in thus attributing to imported Messenger the exclusiveness of trotting action among thoroughbreds, "trotting instinct" is the fallacy that has been the operating cause. If the trot is not an instinct but an action common to the highest type of the horse, the thoroughbred, then that highest type, it logically follows, should be constantly used to improve, not only the stamina and ambition, but to preserve the purity of trotting action of the race of trotters whose trotting capacity and speed have been developed abnormally for fifty years in America. Nothing can be more sound than this conclusion—that the thoroughbred horse has more ambition for speed, more game, and more stamina to carry his highest flight of speed is beyond question. But has he the capacity to exterminate the pacing action? To quote again, Mr. Brodhead, from the Stock Farm: "We have used thoroughbreds in the "plow, the carriage and under the sad-"dle, and invariably they were gamer "than any animals used for the same pur-"pose that had not the thoroughbred "cross. They are better in every par-"ticular. The draft horse whose dam "is thoroughbred is gamer than the pure "bred. *The trotters that we have had "with thoroughbred blood were gamer "than those without it.* Both experience "and observation, neither limited, have "led me to esteem the thoroughbred as "the gamest type yet bred."

The thoughtful breeder can not help but reason in the narrow circle thus forced upon his mind. If Woodburn has actually found the thoroughbred the purest trotting-gaited horse, the gamest horse, endowed with more trotting persistence than the developed trotting-bred horse, so much so that he alone can correct the pacing tendency, why does it not "advocate the thoroughbred to the extent of breeding thoroughbred mares to trotting stallions?" Why has Woodburn "*no idea of going out of the present established lines of what we know are trotting lines.*" Perhaps this incongruity between the theory and the practice of Woodburn may be measurably done away with in the future, since the Palo Alto farm has made such a brilliant success in bringing thoroughbred broodmares into its trotting paddocks. In theory it is certainly more radical than Palo Alto. Instead of believing that "the thoroughbred is a perfectly pure-gaited trotter," Gov. Stanford restricts the statement to the conclusion that perfectly pure-gaited trotting thoroughbred mares can be

Digitized by Google

selected from all thoroughbred families for trotting-brood purposes. One fact, as before stated, is beyond question—the thoroughbred never paces. He has only three distinct gaits, the walk, the trot, the gallop. Another fact is equally indisputable. His high nervous organization urges him on to extreme speed. He is a rapid walker and a swift galloper. In these two respects no horse of any breed is his superior. It is certainly a strange anomaly in his animal economy, therefore, that, with an adequate amount of tuition, he should remain persistently slow at the intermediate gait, the trot. When Senator Stanford supplements his experiments with the force of this unanswerable logic, he is certainly strongly fortified in his position.

But is the statement that "the thoroughbred is the purest gaited trotter imaginable" corroborated by horsemen in general? When the thoroughbreds gather in fields on the race courses, and take their morning exercise, do they not, as a rule, trot with a long, low, stiff-knee action? Are they not constitutional "dwellers" and "pointers?" Is not that thoroughbred a marked exception who trots off with a bold, swinging action, displaying even a medium roll of the knee, and a sufficient widening of the hind limbs and feet to clear his front action? Can not he lope slower than any trotting horse could possibly retain that action without breaking into a trot? When he does assume the trot is not all the grace and ease and freedom he displays on the gallop perceptibly lost? The writer made frequent visits to Woodburn when Norman and Edwin Forrest were the premier trotting stallions on the farm. Their produce were herded together in large fields, while the get of Lexington and of his son, Asteroid, and of imported Australian, roamed over separate bluegrass pastures. As weanlings they showed their distinctive difference of gaits. The trotting colts, although neither their sires nor dams, were strongly prepotent at that early day, would trot away from your upraised hands with alacrity, and show considerable speed, rarely breaking into the gallop, while the thoroughbred weanlings, at the first alarm, would bound away *on the gallop*, some starting from the walk, and overleaping the trot as if they had not been endowed with the intermediate gait. Ocular demonstration thus tends to shade the radicalism of the statement that "the thoroughbred is the purest gaited trotter imaginable." But is his trotting action sufficiently confirmed and intense to wipe out the unsightly pace? The black pacer, called old Canadian Pilot, was absolutely chronic in his pacing action. He never trotted, not even when going at his leisure. He was constructed on the pacing lines of the old type, heavy, yet high fore-handed, tapering to thin drooping hind-quarters. But his courage was remarkable. His pacing speed was phenomenal. On the ice courses of his native Canada he could overmatch the running horses that were pitted against him in half-mile contests. Yet, with all this developed pacing speed, his Kentucky son, Pilot Jr., full of thoroughbred blood, had only trotting action, while his Indiana son, old Tom Crowder, mongrel bred, with no thoroughbred infusion, had exclusively the pacing gait. Mr. Brodhead concludes that the thoroughbred blood of the dam of Pilot Jr. wiped out the pacing tendency, although the blood of his dam's sire and of her dam can not be traced by the censors of the trotting registers. It is in confirmation of this theory that the entire list of his standard progeny comprises eight trotters and no pacers. But Tom Crowder, the Indiana son of Canadian pacing Pilot, with no thoroughbred blood, real or reputed, in his veins, has just as clear a record. He sired no standard performers, but his son, Brown's Tom Crowder 933, sired one standard trotter and no pacer, and his son in turn, Jamison's Tom Crowder 934, produced Marion, one standard trotter and no pacer. But the test of expunging inherent traits, as well as confirmed action, is the capacity of obliterating them in succeeding generations. Pilot Jr. was bred to the thoroughbred mare Telltale by Telamon and produced Tattler. This rich infusion of thoroughbred blood should have precluded the possibility of the pacing gait in his progeny, yet Gossip, one out of his five standard performers, is a pacer. In the second generation the pacing gait again

Digitized by Google

appears with renewed strength and speed. Indianapolis and Voltaire, two of his best sons, are out of daughters of Mambrino Chief, who not only never produced a pacer himself, but whose three great representative sons, Mambrino Patchen, Clark Chief and Woodford Mambrino, never begot a standard pacer. This is a remarkable record in its freedom from the pacing action, in these days of the degenerating lapsing of all the trotting families into the pacing movement. Yet the objectionable pacing gait again appears in the produce of both Indianapolis and Voltaire. Superadded to the thoroughbred dam of his sire, and his own Mambrino Chief dam, his grandam is said to be, in the Year Book, by thoroughbred Bertrand; yet Indianapolis has produced five pacers to his three trotters, the pacers showing a much greater average of speed. To add to the inexplicable confusion, one of the trotters, Indigo, 2:23¼, is out of a pacing-bred dam, by the pacer Corbean, and one of the pacers, De Jarnette, 2:17, is out of Belle, the daughter of Lytton's Warfield, by thoroughbred Berthune! It is to be deplored that thoroughbred blood is not potential enough to wipe out the wiggling pacing gait, to the same degree that it undoubtedly influences extreme trotting speed. But the records add to rather than clear up these interminable contradictions; for not only did Iron's Cadmus, the son of Cadmus, by American Eclipse, produce the mighty pacer Pocahontas, but, through her trotting son, Tom Rolfe, has come four standard trotters and three pacers, and through his son, Pocahontas Boy, has been produced five trotters and seven pacers! Even when the thoroughbred sire is reinforced by mating with a trotting dam, he has not sufficient potency to extinguish the occult pacing inheritance that is involved in earlier crosses; for Clear Grit, by imp. Lapidist, out of a trotting mare, sired four standard trotters and three pacers, *the fastest of which is Fuller, record* 2:13¾, *out of Dolly, by Niagara Champion, and he was the son of imp. Grand Exhibition.* Then, again, imp. Hedgeford, through his son Denmark, has supplied Kentucky with its rackers and pacers for many years. The surmise, therefore, that the Canadian pacers and the Narragansett pacers came from the commingling of the many thoroughbred cavalry chargers brought to this country by the early French and English and German colonial military officers, stationed in the American provinces, finds abundant corroboration, not only from these numerous instances in trotting-horse history, but from the physiological similarities of the thoroughbred and the pacer. Structural peculiarities, like internal evidence in bibliology, often become the most certain means of determining the composite origin of a mongrel race of animals, especially when they are of the same species. When the late Professor Aggasiz was presented with a single bone of an extinct animal, he constructed a diagram of the entire framework of a physical organization so peculiar that many naturalists doubted its accuracy, but the subsequent discovery of a perfect skeleton corroborated his diagram to the minutest details. If the bone structures of the typical thoroughbred and of the primitive pacer had been presented to him, he would have been impressed with their striking forehanded similarity, and equally notable dissimilarity back of the saddle place. The thoroughbred is the more perfect organization. The conclusion, therefore, is inevitable that the pacing structure, which approximates to it in part only, is the result of an outcross upon an inferior organization. When a naturalist like Aggasiz had noted the oblique shoulder plates of the thoroughbred whose exceeding inclination terminates in the prominent point of the vertebræ forming the high sharp peak of the withers, and had examined the power and perfection of the mechanism as an entirety; when he had considered the stout saddle place, and the well developed coupling, supplied with overlapping fillets of powerful muscles; when he had observed the forward prominence of the hips, and the full hind quarters rising almost to a level with the withers, and descending in long thighs and gaskins, to hocks well let down upon short cannon bones, terminating in exceedingly flexible oblique pasterns and symmetrical hoofs, he would have concluded that it was a perfected structure for leaping at

Digitized by Google

extreme speed. The greyhound could not approximate to a more perfect model when the difference in size and weight-carrying capacity are considered. When he had then turned to the less perfect organization of the pacer, combining the forehanded superiority of the thoroughbred with the drooping hind quarters of an inferior anatomy and the sickle-shaped hind legs, bent far under the carcass, causing all four feet to stand close together, he would have concluded that the locomotion must be as peculiar as the structure—not the gallop, which requires a more level, perfect balance of the carcass to produce that most extended of all locomotions; not the trot, which demands the driving power to be placed upon a leverage of higher altitude, because only one hind quarter at a time forces the carcass forward; but a compromise between the two movements, a gait that would enable the limbs on the same side of the carcass to move backward and forward together in harmony; for the sufficient reason that the drooping rump and the close position of all four feet would not permit them to operate without interference in any other manner. As the pacing formation is thus physiologically a compromise between that of the thoroughbred and the trotter, so is the pacing action and the pacing speed a compromise between the gallop and the trot. The pacing speed will always be greater than that of the trot, because all the muscles of locomotion on the same side of the carcass, from the ears to the feet, work in harmony, backward and forward together, while in the trotting movement the muscles, forehanded, on the same side, work in opposition to the muscles of the hind quarters, in order to produce the diagonal gait. The gallop must always be the fastest of all the movements of the horse, because the driving muscles of the hind quarters work together in concert, while in both the other gaits they work separately in opposition to each other, and the forehanded limbs of the thoroughbred also work in concert to sustain the carcass from falling headlong from this excess of hind leverage. The center of gravity in the thoroughbred, therefore, is always in equipoise, so that his muscular system can be taxed to its extreme limit with absolute confidence that his balance can never be disturbed, while neither the pacer nor the trotter can, from the action of their muscles of locomotion, ever have this perfect equilibrium of the carcass.

It is no serious objection to these conclusions that the drooping quarters and sickle hind legs of the primitive pacer have been considerably modified. The heredity of action will be retained even in measurable modifications of form by outcrossing when that heredity has been strengthened by development through successive generations. Thus the pacer, both from experimental breeding and physiological deductions, indicates that he is the hybrid result of the Morganatic mating of the high-formed thoroughbred with the common stock of the country. When devoid of prejudice the enquiring mind traces to the thoroughbred in the last analysis every form of the swift horse, no matter what may be his habit of locomotion. The trotter would come from the common stock of high coupling and elevated croup, while the pacer would descend from the common stock having the drooping hind quarter. As this formation is the less frequent, so is the pace less prevalent than the trot. But when it is confirmed by structural formation and persistent development, the capacity to eliminate it by outcrossing, even in remote generations, is exceedingly questionable.

These deductions and statistics will effectually preclude Palo Alto, or Woodburn from successfully eradicating the pacing gait by the infusion of thoroughbred blood into trotting lineage.

In all probability the early development of the trotting muscles by forcing the weanlings and yearlings through the deep, loose footing of the kindergarten track at Palo Alto, which is kept constantly harrowed two and a half inches in depth, more firmly fixes the trotting gait in early colthood than can any degree of thoroughbred blood, just as in the primitive days of converting the confirmed pacer to the trotting habit, he was driven over deeply plowed fields till the muscles of his forearms were developed into the capacity of giving him a bolder, loftier knee-action, in harmony with the

Digitized by Google

trotting movement. Much as Senator Stanford abhors the pacing gait, he has presented no theory for its extermination.

3. Palo Alto's estimate of the greatest value of thoroughbred blood is when it is confined to the pure-bred dam mated to prepotent trotting-bred sires. From the able management of that farm the writer has recently received the following official statement of this position:

"The thoroughbred experiment at Palo "Alto is no longer known by that name. "Success has been achieved, consequent-"ly we are still breeding the thoroughbred "mare to the trotting stallion. While "the past has shown to the world great "performers as the result of this cross, "it is the opinion of the founder of Palo "Alto that the perfection of trotters will "come from the thoroughbred mare and "the trotting stallion. The first lot of "thoroughbred mares brought from the "southern states to be bred to the stall-"ions at Palo Alto were selected for "their individual qualifications, from the "best racing families, of good disposi-"tion and trotting action. Our first se-"lection was made from mares having "the blood of Planet, imp. Margrave, "Australian, Williamson's Belmont, Bos-"ton and Grey Eagle, their blood figur-"ing in the pedigrees of Sunol, Maud S., "Palo Alto, Ansel, Hambrino and many "others. Of the thoroughbred mares "bred at Palo Alto but few were broken "to harness. *Of these Mamie C., by "imp. Hercules could show a three-min-"ute gait.* She is the dam of Azmoor, "2:20½, and Don Monteith, 2:29¾. "Esther, by Express, dam Colisseum, by "Colossus, could show a four-minute "gait. She is the dam of Express, 2:21. "The trotting action of our thoroughbred "mares has been mainly determined by "seeing them move in the paddocks.

"Another matter in connection with "the thoroughbred mares that have been "bred to trotting stallions and have pro-"duced performers making their names "famous in trotting history is, that they "have only added to their luster as the "matrons of running horses, many of "whom have winning brackets: Thus

1. Annette produced Oliver Cromwell, Chance and Camilla Urso.
2. Dame Winnie produced Diaolo.
3. Esther produced Del Norte.
4. Cuba produced Argyle and Victoria.
5. Fanny Lewis produced Rico.
6. Waxey produced Alpha.
7. Planetia produced Fastress.
8. Helpmate is full sister to the great Checkmate.

Thirteen years ago the master mind of Palo Alto conceived and began in earnest this forbidden method of producing trotters. His catalogue for 1891 enumerates with exultant pride the exceedingly brilliant records derived from this class of first-rate performers. From an empiricle standpoint actual demonstration always rises above opposing theory. This table is so remarkably strong in corroboration of Palo Alto's use of thoroughbred mares in breeding swift trotters that it is worthy of permanent tabulation for historical reference.

Standard trotting performers out of thoroughbred mares bred at Palo Alto.

1.	Palo Alto, 9 yrs. 2:08¾	Dam, Dame Winnie by Planet.
2.	Gertrude Russell, 5 yrs. 2:23½	
3.	Big Jim, 8 yrs. 2:23½	
4.	Hugo, 4 yrs. 2:27½	Dam, Helpmate by Planet.
5.	Ansel, 7 yrs. 2:20	Dam, Annette by Lexington.
6.	Azmoor, 7 yrs 2:20½	Dam, Mamie C. by Imp. Hercules.
7.	Don Monteith 6 yrs 2:29¾	
8.	Aldeana, 9 yrs 2:25	Dam Eliza Dolph, out of Mamie C.
9.	Whips, 8 yrs 2:27½	Dam, Lizzie Whips by Enquirer.
10.	Linnet, 3 yrs 2:29¼	
11.	Emaline, 5 yrs 2:27½	Dam, Emma Robson by Woodburn, son of Lexington and sire of Monarch, 2:28¼; second dam Lady Bell, by thoroughbred Belmont, sire of Venture, 2:27¼, and sire of the dams of Belle Echo, 2:20; Flora Shepherd, 2:30; Nelly Patchen, 2:27; Monarch, 2:28¼, and Prince (pacer) 2:23¾.
12.	Emma R., 4 yrs. 2:28¾	
13.	Cubic, 5 yrs 2:28½	Dam Cuba, by Imp. Australian.
14.	Express, 7 yrs 2:21	Dam Esther, by Express, son of Endorser.
15.	Laura C., 9 yrs 2:29¼	Dam Fanny Lewis, by imp. Buckden, out of a daughter of Bay Dick, he by Lexington.

This table shows many remarkable features. Nine out of these fifteen standard performers are out of four mares—three out of one and six out of three others, each one having produced two standard trotters.

The dam of two, Mamie C., who could show a three-minute gait, is also the dam of another thoroughbred mare. In this list, Eliza Dolph, that produced Aldeana,

Google

record 2:25, at nine years of age, indicating by this large average that they were not the accidental matrons of trotting produce, but that they had more than the average of success, in the table, as compared with great trotting broodmares. They have produced extreme speed at all ages, while to this class of broodmares must be conceded, by the record, the champion trotting stallion of the world. Four of these trotters are out of two daughters of Planet, whose trotting action was remarkably pronounced; two are out of Mamie C., by imp. Hercules.

She had so much trotting capacity as to transmit it as an inheritance to her thoroughbred daughter, Eliza Dolph. Two are out of Emma Robson, by Woodburn, the thoroughbred son of Lexington, and the sire of Monarch, 2:28¼.

Lexington, Mr. Brodhead informs us, had no especial trotting gift, but, nevertheless, he furnished the grandam of Sunol, 2:08¼; Maud S., 2:08¾; Jay Eye See, 2:10; as well as one-eighth of the blood of Clingstone, 2:14; Electricity, 2:17¾, and in addition, the dam of Ansel, 2:20. Australian, whose trotting action was the best ever seen at Woodburn, is well represented in the record of Cubic. It is, therefore, fair to conclude that Senator Stanford selected his thoroughbred mares for trotting-brood purposes with a profound insight into their bloodlines and individual capacity to trot.

His success is so brilliant as to dazzle, if not convince his opponents in the breeding problem. The argument of acquired trotting instinct theory is entirely with them. The results involving the natural trotting instinct of the thoroughbred beyond a question are decidedly with him. The permanent value of these horses as sires is problematical, but the sterling worth of the mares for brood purposes is no longer questionable. Both Woodburn and Palo Alto have silenced the opposition on this proposition.

The management of Palo Alto further says that "large numbers of the produce "of thoroughbred mares have been sold "for high prices to men of wealth for "private use, thus barring them from "racing and records."

But the results from those developed are sufficiently large to warrant an intelligent conclusion. At Palo Alto the thoroughbred mare has made a brilliant record for trotting-brood purposes.

Take the facts presented at Woodburn for another illustration: The only two seasons that Alexander's Abdallah, and the last two seasons that Pilot Jr. made on this farm were during the years 1863–64.

"More thoroughbred mares were bred "to trotting stallions in these years," writes Mr. Brodhead to the *Live Stock Record*, for January, 1890, "than in any "other in the history of the farm. The "fillies foaled in 1864–65 by Pilot Jr. "and Alexander's Abdallah were just "thirty, sixteen being out of the best "trotting-bred broodmares of their day, "and fourteen out of strictly thorough-"bred mares, with no trotting or pacing "crosses. Of the sixteen trotting-bred "fillies, the following were producers of "speed: Tulip, Primrose and Virginia; "*two of them being in the great brood-"mare list.* The following table gives "the speed they produced:

"Tulip, dam of Ulva, 2:27.

"Primrose, dam of Ichi Ban, 2:29¼; dam "of Redwold, 2:28½; dam of Princeps, sire "of Trinket, 2:14; twenty-two in the 2:30 "list, four in the 2:20 list, six sires and "six dams of 2:30 horses; dam of Pluto, "sire of three in 2:30 list; dam of Ab-"dalbrino, sire of Altar, 2:24½; dam of "Maxim, sire of two in 2:30 list; dam "of Parmenus, sire of Daisy D., 2:30; "dam of Rosebush, dam of Chichester, "2:25¼, he the sire of Chetwood, 2:28¼.

"Virginia, dam of Tremont, 2:28½, "sire of Junemont, 2:18¾, and one other "in 2:30 list; three dams of four in the "2:30 list, six sires of thirty-one 2:30 "horses, and one dam of a 2:30 horse.

"From the fourteen fillies from thor-"oughbred dams the following were the "speed-producers: Miss Russell, Mid-"night, Fadette, Vanity Fair, Madge and "Heiress, *five of them being in the great "broodmare list*, as follows:

"Miss Russell, dam of Maud S., 2:08¾; "dam of Nutwood, 2:18¾; dam of Cora "Belmont, 2:24½; dam of Russia, 2:28; "dam of Nutwood, sire of thirty-three in "2:30 list, seven in 2:20 list; five sires

Digitized by Google

"and one dam of 2:30, trotter; dam of "Lord Russell, sire of Redwald, 2:28½.

"Miss Russell, dam of Nutborne, sire of "two in 2:30 list; dam Nutula, dam of "Maudlen 2:25¾.

"Midnight, dam of Jay Eye See, 2:10; "dam Noontide, 2:20¼.

"Fadette, dam of Favonia, 2:15; dam "of Glenview, sire of Euclid, 2:28⅛.

"Madge, dam of Magenta, 2:24¾.

"Vanity Fair, dam of Conway, pacing "record 2:18¾; dam Convoy, 2:22½; dam "Chetwood, 2:28¼; dam Belwood, sire of "W. Van, 2:25¼.

"Heiress, dam of Foxie, 2:28¼; dam "Nightingale, 2:28¾.

"Six dams of thirteen in 2:30 list; six "sires of forty-two in 2:30, out of four-"teen mares whose dams were trotting-"bred."

This table is the most complete that has ever been compiled from the records of Woodburn. It proves, beyond a question, the value of thoroughbred blood, in the dam, on the dam's side, just as the statistics before presented in this paper tend to show how futile it is to attempt to produce trotters from a thoroughbred sire. If this table should be reinforced from the catalogue of Palo Alto for 1892 the preponderance in favor of the half-bred broodmare would be still more augmented. Take, for instance, the successful half-thoroughbred and the successful trotting-bred dams at the Palo Alto ranch. There are twenty-six of the former and forty-eight of the latter. Yet, with nearly double the number, the trotting-bred dams fail to eclipse the half-bred matrons in producing the extremest speed, for Sunol outranks the pure-bred trotters at all ages.

Take the produce of both classes that have beaten 2:20. Six belong to half-bred dams, and nine to trotting-bred dams, whereas to make the success average alike there should be eleven from trotting-bred dams. If 2:25 is made the test, the trotting dams have thirty-two and the half-bred matrons only ten, whereas they should have fifteen.

Thus a critical analysis of the tables indicates that the half-thoroughbred dams outrank the trotting-bred dams in producing trotters of the first grade, and are only outbred when the rate of speed becomes slower. But the mathematics of trotting averages are not always a sure guide in the breeding problem. That the quarter-bred mares will become great trotting matrons and the quarter-bred stallions great trotting sires, Nutwood and Lady Russell, out of the dam of Maud S., have already demonstrated at Woodburn. This problem of breeding on is only secondary to that of extreme speed. When the question of potency is considered, therefore, the stallions out of half-bred mares by Electioneer surpass those out of trotting-bred dams. Thus the two leading representatives of this class are Anteo, 2:16¼, and Richard's Elector, no record, out of a trotting-bred dam. Each has eight representatives in the Standard List. But the quarter-bred sire has three with records below 2:20, while the trotting-bred one has none! The quarter-bred sire has five trotters with records below 2:25, while the trotting-bred sire has but three! These facts so strongly support the breeding theory of Senator Stanford that his statistics argue with great force, the time has not yet come when fresher and deeper infusions of thoroughbred blood should be excluded from trotting pedigrees.

Extreme speed, at Palo Alto, has come from the half-bred dam, and the next grade of speed has come from a thoroughbred dam. Until these are overcome thoroughbred blood can not be regarded as having performed its mission. Indeed when the table of matrons of extreme speed, lately compiled by the learned editor of the *New York Sportsman*, embracing only the dams of not less than two performers with records in 2:20 or better, is considered, it is found that out of the seventeen great broodmares in this list, eight have a strong thoroughbred foundation, while three, Miss Russell, Midnight and Columbine, are the daughters of strictly thoroughbred dams. But there are two significant facts illustrated by this table of extreme speed that seem to have escaped the critical observation of the writer. Two of these great broodmares were sired by Pilot Jr., who was, pre-eminently, the great broodmare sire of his day, surpassing both of his great cotemporaries, Mambrino Chief and Alexander's Abdallah, in both the numbers

Google

of standard trotters and their extreme speed, which his daughters produced. Sixteen of his daughters are in the great broodmare list. They combine all the best strains of trotting and pacing blood then extant. Yet the only two out of these sixteen great producing daughters of Pilot Jr. that have two performers below 2:20 are out of thoroughbred mares. Pilot Jr., being the product of pacing and thoroughbred blood, and these two great daughters being out of thoroughbred dams, gives them a large preponderance of thoroughbred blood. These instances throw a strong light upon the question as to which strain, the thoroughbred or the pacing, contributed the extreme speed. The fact that Waterwitch, by Pilot Jr., out of a pacing dam, is not in the table, nor Santa Maria, dam by Roebuck, nor Pilot Anna, dam by Drennon, coupled with the supporting fact that a purely-bred pacing sire or dam has never yet produced a trotter with a record below 2:15, proves that the extreme speed came from the thoroughbred, not the pacing cross. The coincidence that the only two of his daughters in this rare table are out of thoroughbred mares can not be accidental. When it is noted how exceedingly seldom has been the use of thoroughbred mares for trotting-brood purposes their presence in this list is a remarkable feature. It indicates, as Senator Stanford maintains, the superlative value of thoroughbred blood in brood mares when judiciously commingled with the pedigrees of deeply inbred, strongly prepotent trotting sires. The scholarly chapters written by Mr. John H. Wallace for a work on "Messenger and His Sons," that was never finished, and from the recent triumphs of thoroughbred broodmares in trotting harems never will be, because the facts do not sustain his proposition of the exclusive trotting inheritance of that branch of the thoroughbred family, established, nevertheless, the peculiar physical conformation of Messenger, which was strikingly adapted to the trotting development. That conformation has been transmitted from generation to generation, till it has become so marked that it has been termed the "trotting pitch," and the reinforcement of whatever trotting inheritance his sons and grandsons and great-grandsons received from the more pronounced trotting capacity of other trotting crosses, through Amazonia, in the first instance, producing Treadwell's Abdallah, the first Messenger trotting sire that approximated to three minutes, and through the Charles Kent mare, whose sire, Bellfounder, a faster trotter than the Messenger family had ever produced to that day, was the first horse imported from Norfolk, England, because he was a noted trotter, laid the foundation of both an acquired and a natural trotting inheritance so deep and wide that before the American trotting families were systematically classified, in the first volume of the Trotting Register, the Hambletonians and the Mambrinos and the Clays and the Morgans had grown into large and rapidly increasing families of distinctive trotting excellence and increasing speed. From the recent successful experiments of Govenor Stanford it is beyond question that the speed of each one of these families would have been still more remarkable, if the presiding genius of the Trotting Register had not brought to bear all the power of his learning in unwarrantably ascribing to the Messenger family exclusive trotting capacity among thoroughbreds, and in withholding deserving merit from all other thoroughbreds that had successfully mingled with trotting strains, by recording them as "said to be" running bred in all cases where he was utterly unable to disprove the claim. The Registers and Year Books, while under his control, are full of these "said to be's," much to their detraction as reliable reference books. The same tactics have been brought to bear to discredit some of the successful matrons with strong thoroughbred infusions used at Palo Alto. But these efforts have failed, and Palo Alto methods, by their splendid triumphs, have not only astounded the trotting purist authorities, but are causing some of the leading stock farms of the country to introduce thoroughbred mares into their harems. They are concluding, in spite of authority and the dicta of writers on the laws of animal inheritance, that if Palo Alto can produce the champion trotting stallion out of a thoroughbred mare, and the queen of the

trotting turf out of a daughter of a thoroughbred mare, it may be well to commingle thoroughbred mares with their trotting-bred sires. Thus the Village farm, and the Prospect Hill stock farm and others have made these additions, prompted by the success of Palo Alto. In the immediate future, therefore, the thoroughbred infusion that, notwithstanding its brilliant record from its sparse use in the past, appears in the blood-lines of the very greatest trotting performers of the last decade was generally repudiated, will now receive a broader, more liberal and more thorough recognition.

Meantime, from his well-earned retirement, the venerable compiler of the Trotting Registers comes forth, in a late issue of *Clark's Horse Review*, and, with alarm at this powerful innovation, calls upon the trotting purists, as Moses in the wilderness called upon the faithful to persevere in their exodus, to stand by trotting strains exclusively. Their trotting supremacy, he announces, has become the legitimate result of a careful study of the laws which govern both natural and acquired heredity. He concludes, with an exultation that is as characteristic of exact truth as it is of his accustomed modesty: "*It is only about "twenty years since we presided at the "accouchment of the breed, and the "world has never seen a growth so "rapid.*" The breed, as typified in the four cardinal trotting families, was formed long before he assumed the professional duties of midwife he so proudly claims. The life work of Hambletonian and Ethan Allen and Andrew Jackson was then complete. The value of his services consisted in classifying these families, in establishing the basic pedigrees, and in enforcing, it is now demonstrated upon an imperfect basis, the laws of heredity. These services, with all their imperfections, are simply of incalculable value. No liberal student of the trotting problem would attempt to underrate them. But the claim of Mr. Wallace that he was the author and finisher of the trotting breed, which he designs to convey in the term "*accouchment*," is far from historical accuracy. With a preliminary success that bids fair to prove how imperfect was the purview of Mr. Wallace in excluding from record and paddock the further infusion of thoroughbred blood, Senator Stanford, within the next decade, may demonstrate that the two-minute trotter will have for his dam a thoroughbred mare.

ONCE AROUND THE GLOBE.—(Concluded.)

[In enumerating the peculiar horses of old, we omitted to include the remarkable "horse of destiny" of Julius Cæsar, mentioned by Suetonious, which had "cloven hoofs like a man's fingers," or as again rendered, "human feet with toes." In the Rigvedas of India, too, the horses were said to have "hands," but though in this case the description is put down as metaphorical, yet it seems more than a mere coincidence.]

The European Series of Horses.—In 1857 Owen, the British palæontologist, made a study of the derivation of the single-toed equine from its European three-toed ancestor—the classic *Palæotherium medius* discovered by Cuvier in France in 1804. The series he made out was: *Palæotherium*, *Hipparion*, *Equus*.

A comparison of the European and American lines is interesting. European scientists were naturally inclined to regard the American forms as being evolved from the Asiatic, before the people of the old world had learned to make use of the horse as a domestic animal. But the tendency of the horse to become more specialized and persistent as it spread westward would rather indicate that, by going from Asia to America, such progress was against the nature of its evolution. To support the assertion, it was claimed that the American forms "did not approach the present horse so closely as the European." This it would appear, is, however, hardly the case, as will be seen in the sequel.

Comparison of European and American horses:

Digitized by Google

PERIOD.	European Series.	American Series.
Present time	Equus	?
Pliocene (upper)	?	Pliohippus.
Pliocene (lower)	Hipparion	Protohippus.
Miocene (upper)	Anchitherium	Miohippus.
Miocene (lower)		Mesohippus.
Eocene (upper)	Palæotherium medius.	Orohippus.
Eocene (lower)	Palæotherium	Eohippus.

Dr. Max Schlosser is one who believes in the American origination of the European horses. According to him *Hyracotherium* (an even anterior form to any of the "horses") and *Hipparion*, and possibly also *Anchiterium* are assumed to be, by origination, American forms which subsequently wandered over to Europe. Hipparion, by later researches, is regarded as not being in the direct line of descent, though closely allied. European scientists seem to be now inclined to fully accept the American origin of the horse.

That the European line is more incomplete is evident. But it must not be assumed that with further discovery the difference will not be equalized. Important additions have already been made. The gap between the *Hipparion* form and *Equus*, which clearly existed and was filled up in the American line by *Pliohippus*, no longer exists in the European series either. The races from the Quaternary period of Upper Italy classed together as *Equus stenonsis*, include all the required intermediate stages between *Hipparion* and the present *Equus caballus*. In this connection the wild horse of Przevalsky has to be also taken into account, as presenting to us the nearest existing approach to the true horse, yet sufficiently distinct to be classed as a separate species.

The Distribution and Domestication of the Horse in Europe and Asia.—"The horse was first undoubtedly reclaimed in the central regions of eastern Asia, where it still roams free; that is, where herds truly wild and not the degenerate descendants of a subjugated stock still maintain their position. From these tablelands of high Asia, traversed by the fortieth and fiftieth lines of north latitude, the horse was carried eastward, westward and southward, by successive waves of warrior hordes who were bent upon the acquisition of new territory." It is not, however, here asserted that the original home of the wild horse must have been limited to Central Asia. On the contrary, it appears to have been spread over the temperate regions of Europe. In the vast forests of Poland and Prussia wild horses existed, as did the bison (Aurochs) from an early up till a late period.

The question whether the wild original of the domestic horse in Europe is descended from any species whose fossil relics are so abundant in company with the mammoth and the mastodon is one interesting in considering its evolution—or development. It is one for the anatomist to decide. Of these fossil relics there are some which so closely resemble the same bones in the modern horse of middle stature that no decided anatomical difference can be pointed out. These fossil bones are such as are common in Europe, India and America.

From an examination of the collection of the fossil relics of the horse in the British museum, it has been decided, that on continental Europe two species of horse at least existed. One was of middle size, and one not exceeding the size of a pony. In Britain the relics of a small species, probably identical with the continental one, existed; but there was also, as its relics prove, another and larger kind equal to a powerful cart-horse in stature.

The common supposition that the horse was of Asiatic origin and had been introduced by human agency from its supposed original home in the steppes, is therefore contradictory to the results attained by later palæontologists and archæologists.

As far back as the middle tertiary times, Europe possessed horse-like animals (*Anchitherium* and subsequently *Hipparion*), and it is absolutely certain that since the beginning of the diluvial period Europe has been inhabited by wild horses, which must, says Alf. Nehring (*Journal of Science*, May, 1885), be zoölogically referred to *Equus caballus*, and which can not be specifically distinguished from the domestic horse of today. In short, the existence of horses in Europe—and especially in Central Europe—can be demonstrated as continuous for the entire time from the beginning of the diluvial period till the present.

Digitized by Google

During the diluvial period, and especially during the glacial epoch, Nehring points out there occurred for thousands of years a wide limitation of forests. Toward the end of the ice age, and in the first portions of the post-glacial time, there existed in Central Europe extensive steppe-like regions, covered only with grass and herbs. Not until toward the end of the diluvial age did the forests again occupy Germany.

Those thinly wooded, steppe-like districts of the diluvial age were the resort of many thousands of wild horses, as may be seen from the vast quantity of fossil horse-bones which have been everywhere found in the corresponding deposits of Central Europe.

This diluvial wild horse was a strong-boned, thick-headed, middle-sized animal of about fourteen hands three inches in height. It served the then inhabitants of these regions purely as an object of the chase, *i. e.*, for food, etc.

Subsequently as the diluvial steppe-regions of Central Europe became restricted by the advance of the forest and their peculiar fauna was driven eastward, the majority of these wild horses also withdrew toward the steppes of the East. Only in the open spaces, which even during the greatest extension of the forests remained in the shape of meadows, heaths, and swampy hollows, there remained wild horses during the prehistorical forest age. But their number was far smaller than it was formerly, and their fossil bones show that the climate and conditions of existence were unfavorable. Most of the horses of the forest age, whose remains we find in the North German moors, in certain of the pile-villages, that we have become familiar with, in the circular pits of Oldenburg, and in other situations, were small, thin-boned animals, which were only about twelve hands in height. In comparison with the steppe horses of the diluvial age, they were weak and degenerate. Nehring further asserts: "From materials before me, I am in a position to prove that the horses in those regions underwent a progressive degeneration in size and strength from the diluvial period down to the age of the Germanic forests."

It is interesting to follow Nehring in the amplification of his views on this point: "The causes," he says, "of such degeneration may be seen, on the one hand, and principally, in the damp forest climate, unfavorable to the health of horses, and in the decrease of the pasture lands necessary for their existence, and, on the other hand, in the action of the gradually increasing domestication of the horse.

"The beginnings of domestication in most animals are accompanied by a certain degradation. So long as man stands at a low stage of culture he uses up the animals which he brings under his yoke, and deteriorates their conditions of existence. He restricts their liberties, he uses their strength often beyond a permissible degree; he deprives the young of a portion of their mother's milk; he weans them too early; and, in propagation he compels them to prolonged in-breeding. All this, and much more, gives rise to a degeneration which is shown not merely in the outward appearance of the animals, but even in the skeleton. Not until man has advanced so far in cultivation that he bestows upon his domesticated subjects the necessary care, as dictated by a proper appreciation of the factors essential to a sound development of each species, and when besides the animals themselves have become accustomed in the course of many generations to the changed mode of life due to domesticity, do the bodies of tame animals again become larger and stronger, so that they may often exceed the mean stature of their wild forefathers. This may be proved from the history of the horse and other domestic animals."

But it must not be inferred that all the horses now existing in Europe can be traced to the wild horse of the diluvial epoch. Such a contention would be easily refuted. It is certain that foreign horses were brought into Central and Western Europe, in part from Central Asia, and in part from the Mediterranean lands. Especially the so called Oriental horse has been used in the last centuries for breeding a superior class of horses, and has impressed a new type upon an essential portion of our present race of horses.

But it is certain that Asia is not the

Digitized by Google

exclusive home of the horse. Europe had for ages untold possessed horses, wild at first, but afterward in part domesticated. The descendents of these tame horses bred on European soil may still be seen in the so-called common horse where not modified by outside crossing.

Additional Evidence of a Primitive Horse in Europe.—The horse had spread over Europe before the supposed period of domestication in Asia by a particular race. He was a wild animal, it has been shown, roaming in immense herds over the plains of Europe up to the period of the bronze age.

In many early palæolithic stations the remains of the horse, associated with those of the reindeer, are extremely abundant. At this time the animal "evidently formed a chief portion of the food of the people," but he was manifestly wild. In the oldest of the neolithic Swiss lake-dwellings the remains of the horse are absent, or very rare; afterward they became more common, and in the late bronze age the discovery of bits proves that the horse had at last been tamed. Hence it is evident that the common name for the horse ("Swift one:" *agva, equus,* etc.), must have referred to the animal as an object of the chase, and has no more significance than the existence of such common names for the wolf and fox.*

"In some of the caverns in France the remains of the horse are more abundant than those of any other animal, more even than those of the wild ox. Thus at Solutrè, near Maçon, the bones of horses which had formed the food of the inhabitants of this station form a deposit nearly ten feet in depth and more than 300 feet in length, the number of skeletons represented being estimated at from 20,000 to 40,000. This primitive horse was a diminutive animal, not much larger than an ass, standing about thirteen hands high, the largest specimen not exceeding fourteen hands. The head was disproportionate in size and the teeth were very powerful. Pictures of these horses, already referred to, have been preserved to us in a very curious way. There were artists among the cavemen of those days. Their pictures of the horse and other animals, made on antlers and horns, are drawn "with a spirit, a vigor and a fire that would do credit to an artist of to-day."

Deposits in caves near Palermo afford evidence that the wild horse formed the chief sustenance of the early inhabitants of Sicily. "Herds of wild horses were probably chased along the narrow valleys into pitfalls, or over the cliffs, and so destroyed." With the introduction of improved bone and horn weapons the wild horse became less abundant; but he had a wild range over France, Belgium, Germany, Switzerland and England. In the neolithic age we have seen the wild horse ranged over the plains in the west of Switzerland, and formed an element in the food of the lake-dwellers. He appears at first to have been only semi-domesticated. "For the sake of their flesh and milk, herds of half-wild horses may have been driven along by the Aryan herdsmen migrating in search of pasture, as is even now done by the Tartars of the Asiatic steppes."

After referring to the dates of the domestication of the horse among the Accadians, Egyptians, Hittites, and to the Turko-Tartars, who were perhaps the first subjugators of the horse, Dr. Taylor proceeds: "In the Swiss lake-dwellings of the stone and early bronze ages, bones and teeth of horses, which were doubtless used for food, have been scantily found; but it is only at Möringen and Auvernier, which belong to the later bronze age, that we find horses' bits made of stags' horns and bronze. These bits are only three and one-half inches wide, and could now be hardly used for a child's pony. I have made some measurements for the purpose of ascertaining the size of the horses for which the bits of the bronze age would be suitable. A cob of thirteen and one-quarter hands required a bit of four and one quarter inches in width, and a Shetland pony of eleven and three-quarter hands required a bit of three and three-quarter inches in width, and shoes three inches wide. Modern bits for horses vary in width from four and one-half to seven inches, and I am informed that bits of the size of those found in Swiss lake-

* "*The Origin of the Aryans,*" by Dr. Isaac Taylor.

Digitized by Google

dwellings are now only used for donkeys. The earliest horseshoes came from the lake settlements at Paladru, in Dauphiné, which belongs to the late iron age, and is probably post-Roman. The shoes are from three and one-half to four inches in width, a proof that the horse had then been tamed."

For a long period after the horse was tamed he was reserved entirely for chariots of war, as among the Egyptions, the Assyrians and Hittites, and also for chariot races and triumphal processions, as among the Etruscans and Greeks. In ancient Egypt, as now, the ass was exclusively used for riding. There is nothing in the Veda to show that the art of riding was in vogue. The first notice met with indicates that the art was first acquired from the Tatar tribes. The names for equitation, says Canon Taylor, are different in the various Aryan races, showing that the art was acquired independently. Among the Greeks, as Homer describes, horses were harnessed to chariots for war or races, and a bareback horse might have occasionally been mounted, but there was no riding in the modern sense. There are indications, too, that when the horse began to be ridden it was first with a halter instead of a bit.

The evident reason for not using the horse for riding, after the idea had been boldly attempted, was simply because the horse was yet too small for any very special exercise in that way. Domestication had not yet commenced to tell in increasing the size of the animal. After losing all reminiscence of its former freedom, and with the care of man aiding it, a sudden improvement was the result in size and adaptability. From such period it has been improved into innumerable races or breeds. With the establishment of these, new departures in varietal forms were but inaugurated.

Instances of Increase in Size from Scientific Breeding.—Mr. Anthony Hamond, in a recent issue of *Baily's Magazine*, states that during the last 150 years the thoroughbred has increased three inches in height. In the *Racing* volume of the Badminton library, it is stated that Poland has produced several thoroughbreds sixteen hands in height. Mr. Hamond also states that whereas fourteen hands was formerly the recognized standard for hackneys, previous to 1885 it was increased to fifteen hands seven inches. And at the latter date the Royal Agricultural Society was induced to allow entries in the hackney class of animals of that height and over.

Now comes Mr. T. Dykes, who says that "the primitive Clydesdale was the galloway [I would here interpolate the remark that all the authorities write this word *without* a capital], the ancient Scottish native horse two inches or so less in height." Lawrence, 1809, gives the height of the galloway as from thirteen to fourteen hands. Professor Wallace, of Edinburgh University, 1889, gives the height of the Clydesdale of the present day at from sixteen to sixteen hands two inches.

Infinite Variety of the Horse "Type."—From the pony, twelve and one-half inches high, to the horse, eighty-four inches (from three to twenty-one hands) indicates the extreme range of variety among the members of one species all included under the name of *Equus caballus*. The word *equus* we have indicated originally meant swift in all languages of Aryan origin. After the word had become so indissolubly associated with the animal, it came generally to apply to the animal known in the different languages of the West as the horse, *hrosc*, *rosch*, *pferd*, etc. Hence it was used to distinguish and include all animals of a general horse character—*caballus*, *assinus*, *zebra* and *quagga*. These are all included in the one genus *Equus*, for the reason that no highly important differences are discoverable in their general anatomy (as shown, for instance, in the most imperishable portion, the skeleton, which has become, in so many instances, preserved to us in the fossil state), the outward appearance of which has resolved itself, in life, into the various specific forms or divisions of the genus. From the above will be seen what really widely and inclusive terms *equus* and *horse* are.

Remains in India.—In India the fossil bones of two, if not more, species of horses have been brought to England by

Digitized by Google

Captain Cantley. They were found with the relics of other animals, lying on the slopes among the ruins of fallen cliffs, and partly *in situ*, in the sandstone of the Sewalic hills, at the southern foot of the Himalayas, between the Sutlej and the Ganges. One species appears to have closely resembled the breed depicted upon the sculptured monuments of Ninevah and those of Egypt and Greece—the skull is broad between the eyes and the chaffron concave, as in the Arab breed of the present day. Another breed was small in size, but long-limbed and probably very fleet. The bones of the limbs are remarkable for their slenderness, and remind us of those of the antelope.

The Lately Discovered New Species of Wild Horse.—A recent and important discovery has been made in Asia, of a new species of horse, previously entirely unknown. The honor of the discovery belongs to the Russian traveler, Przevalsky. This equine is more nearly allied to the domestic horse than any previously known species. It is a most interesting discovery, for in Europe the horse, as stated, was supposed never to have existed in an aboriginally wild state. This horse can't be termed a modern horse, nor can it be termed an ancient horse. It seems to be the crude completion of the destiny of the old series from which the modern horse was originated. Its description is here given:

It has warts on its hind legs, as well as on its fore legs, and has broad hoofs like the true horse. But the long hairs of the tail instead of commencing at the base do not begin until half way down the tail. In this respect *Equus przevalskii* is intermediate between the true horse and the asses. It also differs from typical horse in having a short, erect mane, and in having no forelock. Nor has it any dorsal stripe, which although by no means universal, is often found in typical horse, and is almost always present in the asses. Its whole general color is of whitish gray, paler and whiter beneath and reddish on the head. The legs are reddish to the knees and thence blackish down to the hoofs. It is of small stature, but the legs are very thick and strong and the head is large and heavy. The ears are smaller than those of the asses. This horse inhabits the great Dsungarian desert between the Altai and Tianschan mountains, where it is called by the Tartars, Kertag, and by the Mongols, Statur. It is met with in troops of from five to fifteen individuals led by an old stallion. Apparently the rest of these troops consist of mares, which all belong to the single stallion. They are lively animals, very shy and with highly developed organs of sight, hearing and smelling. They keep to the wildest parts of the desert and are very hard to approach. They seem to prefer especially the saline districts and to be able to do long without water. The pursuit of this wild horse can only be undertaken in winter because the hunter must live in the waterless districts and must depend upon a supply of water prepared from melted snow. As may well be believed, such an expedition during the severest cold of winter into the most remote part of the desert must take at least a month. They are very difficult of approach, and the capture of the one specimen now in the museum of the Academy of Sciences of St. Petersburg was accompanied by extraordinary difficulties and hardships. (*Nature*, August 21, 1884.)

There is a very close resemblance between the figure of Przevalsky's horse and that of the horse incised on the antlers found in the cave of La Madelaine as given in Boyd Dawkins' "Early Man in Britain." There is the same massive head, the same hog mane and absence of forelock, pointed ears, short body and powerful legs, while there seems even an indication that the long hairs of the tail spring first from the middle of that organ. In that of Cresswell crags as well as those of La Madelaine the jaw is heavier than in the recent specimen.

The Horse not Really Extinct in America before the Advent of Europeans.—We have thus followed our subject up to the point where he was fully developed in Europe—a "clean proof," so to speak, of his former chaotic self. He had been there at last finally and fully subjected to human use. This opened up a new career for him. He became the constant companion and follower of his master.

Digitized by Google

It may be said he was the first domestic animal of importance to accompany the European across the Atlantic. The early history of the animal in this country as imported by the European is one of the marvels of natural history.

The past history of the ancestry of the horse being then a blank unknown, and the almost miraculous increase into herds composed of innumerable individuals from a few escaped or discarded progenitors emphasized the statements as to the non-existence of the horse in America previous to the Spanish "invasion." But besides the evidence of scientific discovery there is what may be called evidence of record which clearly indicates that the American horse was not really extinct at the time alleged, as has been supposed and repeated in all general writings on the subject.

We shall present this "evidence of record" as we collected it, comparing it with the highest scientific authorities in Europe and America.

E. L. Berthoud, Golden, Colo., in the Kansas City *Review*, November, 1881, published the following:

"Having had occasion to send to Paris to purchase some rare maps of the fifteenth and sixteenth centuries I received among them the map of Sebastian Cabot, 'Piloto Mayer' of Charles the Fifth, king of Spain. This map, drawn in a circular projection, by Cabot himself, on which he has delineated his own discoveries and those of John Cabot, is of singular value as representing the true state of geography and discovery in the early portion of the sixteenth century, and was drawn up prior to the year 1546–47. Sebastian having left for England to take service there, in 1547, this map was drawn by him while he was in the Spanish service previous to that date.

"Now, it is an incontestible fact that Cabot went, in 1527, to the east coast of South America on an exploring voyage; that he discovered the rivers La Plata and Paruna and explored them some distance iuland, returning to Spain in 1530. Upon examining that map I find that the Rio La Plata was explored up to the 25th parallel of north latitude and Spanish names given to its branches and all prominent points, and, in addition, he has marked on the maps pictures of the natives, prominent animals and some trees, and that at the head of the La Plata, with the puma and parrot, or perhaps the condor, he has given the horse, as apparently that existed then in these vast plains of the Gran Chaco where to-day they roam in countless herds. It may be claimed that this is not proof of their native origin, but we claim that it is fair presumption, for neither Spaniards in Peru nor other parts of America, or even Portuguese, had been long enough in South America for the few Spanish horses introduced to have roamed wild from Peru to the head of the Paraguay and Parana rivers to have attracted the attention of the Spanish explorers. The period was too short and the distance too great from the Spanish possessions in Peru across the vast forests of the Andes for such a rapid increase. We can reconcile this discrepancy only by believing that the paternity of the vast herds of the Argentine Republic and of Paraguay was a native breed of American horses, mixing afterward with the Spanish breed introduced by the conquerors. Not twenty years had passed between the discovery of Peru and the discovery of the Rio La Plata."

In his work on "Distribution of Animals," 1887, Prof. Angelo Heilprin remarks: "That America was wholly or in great part, deficient in horses at the time of the Spanish conquest, is proved beyond a doubt, but at the same time it is equally proved, from the number of fossil remains that have been found between Escholz Bay, Alaska, in the north, and Patagonia, in the south, that the animal not only inhabited, but abounded on the continent during a period comparatively recent preceding. There is further, very little question as to the contemporaneity of the horse and man on the American continent, *and indeed it would appear not exactly improbable, from certain references contained in old narratives, that at least in South America the animal still lingered on even after the advent of the Europeans.* What led to the general extermination, when under apparently similar physical conditions the introduced animal has been able to thrive to such a

Digitized by Google

wonderful degree, is a problem which still awaits solution." The portion italicised (by us) of the above, written after Berthoud, may be taken as repeating him, or referring to the same evidence, which shows that it was not unacceptable.

In connection with the above passages we have just discovered the following sentence written by John Lawrence, which appears on page seven of that author's "History and Delineation of the Horse," published in 1809, one of the classic horse books of the English language. He says: "*The non-existence of the horse in America, previous to its discovery by the Europeans, has, however, been disputed, but I recollect not by whom or upon what ground.*"

We consider that as a most remarkable piece of "evidence." It is so significant that it needs no comment. It stands out alone, of unique interest and value. Lawrence, writing in 1809, could not have "copied Berthoud," who wrote in 1881. Therefore, whence the title of the "grounds" of the "disputed" statement?

Lawrence's statement is, we believe, the first and only one of the kind in written records. May it not have been derived from the knowledge of those acquainted with such early maps and naratives—a knowledge that floated around, but had no one to be interested in who would regard it as of importance, or worthy of investigation and preservation?

We would now quote here the last authority we have, W. H. Flower, F. R. S., in his just published little work "The Horse," which we have, since the above was written, secured directly from the London publisher. After describing the numerous fossil remains found in the Americas, we find the following: "Whether any of these remains should really be referred to *E. caballus* or not, that is, whether they belonged to animals which possessed all the external characters attributed above to that species, is, of course, doubtful. Our knowledge of existing forms teaches us that skeletal and dental characters may be associated with considerable external differences, especially as character, distribution and color of the hair. * * * All we can do with a fossil bone or tooth is to assign it to any known species which it resembles so closely that no actual definable difference between them can be detected. In this sense we may speak of *Equus caballus* having existed in America before its introduction by the Spaniards, although it is commonly supposed that at the time of the conquest no horses, either wild or domesticated, were to be found on the continent." To that is the following important note: "The usual statement as to the complete extinction of the horse in America is thus qualified, as there is a possibility of the animal having still existed, in a wild state, in some parts of the continent remote from that which was first visited by the Spaniards, where they were certainly unknown. It has been suggested that the horses which were found by Cabot, in La Plata, in 1530, can not have been introduced." And as to that he refers as authority to M. Wilckins.

It certainly could not be supposed that such existing American horse had characters indistinguishable from *E. caballus*. We should expect a horse of distinct specific characters of its own, but still entitled to be termed a *true* horse—just as *E. przevalskii* is regarded in Europe as distinct from *E. caballus*. Prof. Cope, who has a world-wide reputation as a palæontologist, has favored me with a communication on this subject in which he points out distinctly that "No fossil horse allied to the *E. caballus* has been found in America." But, on the other hand, writing in 1887, he says: "It is certain * * * that man was contemporary with species of equus on the North American continent. I have identified the remains of *E. occidentalis* and *E. excelsus* from the upper pliocene bed of Oregon, where they were mingled with obsidian arrow-heads and scrapers in a sandy bed easily disturbed by the wind. The contemporaneity of these remains being under such circumstances uncertain, it remained to discover them in a more solid deposit to confirm the suspicions raised by their associations as first observed. Such a discovery has been made in Nevada by Dr. Gilbert, a member of the United States Geological Survey." In 1891, in commenting on a

Digitized by Google

specimen of a skull of *E. excelsus*, which, in important points, "approaches nearer the horse," he remarks: "The frontal bone is crushed in between the orbits * * * It is singular that that part of the arch of the skull which presents the strongest resistance to pressure is crushed while the weaker regions remain entire. Unless a stone occupied the exact position calculated to produce this result, it might be imagined that this horse was knocked in the head with a stone hammer such as has been found in the same bed by the discoverer of the skull." Prof. Cope has described at least two other late fossil horses. Those just described being contemporaneous with aboriginal man, have a position of their own. Later than either fossil or contemporaneous horses, of course, would have to be ranked such horses as seen as existing by Cabot in South America.

The above presents a respectable body of evidence which proves the remarkable nearness of true horses to present times in this country. It thus seems that the horse was not extinct when the European pioneers first became acquainted with this country. It might almost be claimed that the extinction of the American horse existing in places untrod by the new man was caused by its existing remains becoming engulfed or "swamped" in the more highly specialized equines introduced across sea, this being, maybe, the very cause of the unparalleled rapidity of multiplication displayed, obliterating the very actual evidence forever of a previously existing equine in its speedy absorption in the resultant mixed progeny.

These indications are no less interesting to contemplate than they are important to follow up. We know that the Indian never attempted the domestication of the bison, which has been proved to be even more easily subjugated than the horse could have been by the old-world men, hence he would not be expected to see anything in a horse animal that would be of benefit to him. The Indian did not know the "wile" of making such animals his servants, hence was wanting one of the great means that preserved the horse to us in the old world, and an animal at last pre-eminently fitted for man's handling. When a form of animal seems to have acquired its greatest development and no "higher calling" prepared for it, it seems to become used up and to die out.

With the arrival of the descendants of the common American ancestor, as developed in the European horse, and the obtaining an easy dominion over the lingering (superfluous on the scene) "relics" of the disappearing American line of the family, is completed the circuit indicated by our title.

"TROTTING BRED MARES LEAD."

EDITOR OF THE MONTHLY:

THE above is the caption of one of your editorials, and, in all probability, a large majority who read the article will agree that the headline was justified by the tables incorporated. Taking the records made and the Palo Alto catalogue to prove the breeding of the animals which are included in the list of those which are credited with the records for data, the results are warranted by the inexorable logic of figures.

But there is another element, an important element, which you have overlooked, and which should be embraced in the calculation to arrive at a just conclusion. That is the proportion, or to make it plainer, a statement which will show the preponderance of Electioneer's 2:30 performers from trotting-bred mares when compared to those from thoroughbred or half-thoroughbred.

Taking the last catalogue, issued 1891, though the publication of that was deferred until the year was nearly ended, for a guide, there are recorded 320 foals by Electioneer. According to my classification 177 are from trotting-bred mares, 86 from half-thoroughbred mares, 53 from thoroughbred mares, and four from pacing mares. In your tables you give "the fastest ten from pacing mares are: Manzanita, 2:16; Ladywell, 2:16½; Bonita, 2:18½; Wildflower, 2:21; Fay, 2:25; Fred Crocker, 2:25¼; Aleck B., 2:25¾; Lucyneer, 2:27½; Pomona, 2:28¼; Alma,

2:28½." That is surely incorrect. The dam of Manzanita and Wildflower had a trotting record of 2:30½, the dam of Bonita a trotting record of 2:30¼. The dam of Ladywell was by the trotter Fred Low, record 2:41¾ in 1868, when a four-year-old, and her dam was by Doc, the sire of Occident, trotting record 2:16¾. The dam of Fay was by Fred Low, and her dam by John Nelson. The dam of Fred Crocker was not a pacer, and the dam of Aleck B. was by the trotter George Lancaster. Lucyneer is from the grand old pacer Lucy, and as the dam of Pomona was by George Lancaster, and the dam of Alma by the same horse, and a sister to Aleck B., only one of the ten mentioned was from a pacing mare. Prussian Maid and Lucy are the only pacing mares in the Palo Alto catalogue which have a record which would entitle them to registry, and with only four foals by Electioneer to represent them, it is not a bad showing to have a three-year-old mark of 2:27½. The others can surely be rated in the trotting-bred division, and that will compel a revision of the list under that head and make a better average, thus:

Arion, 2:10¾.
Advertiser, 2:16.
Manzanita, 2:16.
Ladywell, 2:16½.
Adair, 2:17¼.
Lot Slocum, 2:17½.
Norval, 2:17½.
Campbell's Electioneer, 2:17¾.
Montrose, 2:18.
Bonita, 2:18½.

This will give an average of 2:16.55 against 2:18, as you had it.

Accepting the proposition that proportion is a fair standard to use as a test, and there is a simple "rule of three" question to solve. If 177 foals from trotting-bred mares show ten with an average record of 2:16.55, how many should fifty-three foals from thoroughbred mares show, 177:10::53=3.

Palo Alto, 2:08¾.
Ansel, 2:20.
Azmoor, 2:20½.

Average, 2:16.41½—$\frac{13}{100}$ of a second in favor of the thoroughbred dams, a small advantage, but enough to win the race.

Then to take the produce of half-thoroughbred dams, 177:10::86=4.858+ we will call it five.

Sunol, 2:08¼.
Anteeo, 2:16¼.
Amigo, 2:16¾.
Electricity, 2:17¾.
Suisun, 2:18½.

Average, 2:15.45—1.10 seconds better than the trotting-bred dams, $\frac{86}{100}$ of a second better than thoroughbred dams.

Uniting the dams which have "running foolishness" close up, thoroughbreds and half-breds, and the "sum" will stand 177:10::139=785. Call it eight:

Sunol, 2:08¼.
Palo Alto, 2:08¾.
Anteeo, 2:16¼.
Amigo, 2:16¾.
Electricity, 2:17¾.
Suisun, 2:18½.
Antevolo, 2:19½.
Ansel, 2:20.

Average 2:15.72. The result of this verdict of figures, which are said "never to lie," although they can be "juggled" somewhat, is that Electioneers from half-bred dams take the first place, a length in the lead of those from thoroughbred dams, which are second by half a neck, the progeny of trotting-bred dams making a grand race and worthy of all the encomiums bestowed. As stated before, the figures were obtained from the last issue of the Palo Alto catalogue, and, consequently, are not exact, and to be absolutely so Electioneer's books would be the only source of complete information. That a full search will return a still larger proportion of trotting-bred mares having foals by Electioneer, is beyond all reasonable doubt. The earlier catalogues show that few thoroughbred or half-bred mares were in the trotting stud at Palo Alto for several years after Electioneer was purchased, and that there has been a constant increase in their numbers the succeeding volumes will prove. Therefore the last will contain the maximum of these two classes, and in place of 139 foals in a total of 320 there will be a reduced proportion of these two classes, and the fifty-three foals from thoroughbred dams not greatly augmented, while there will be quite an addition to the 177 from trotting-bred dams. Mares which were alive when

Digitized by Google

the last catalogue was compiled are entered, the dead being omitted. "Outside" mares which have had foals by Electioneer are, of course, not mentioned, but of that class it is certain that not one thoroughbred mare figured among them, and very few half-breds. As an illustration of the bearing that this has on the question, the lists presented will be analyzed. In that representing the ten fastest from trotting-bred mares the dams of

Arion is alive and had four foals by Electioneer.

Advertiser, alive, and had two foals by Electioneer.

Manzanita, dead, and had five foals by Electioneer.

Ladywell, alive, and had three foals by Electioneer.

Adair, outside, and had three foals by Electioneer.

Lot Slocum, alive, and had one foal by Electioneer.

Norval, dead, and had three foals by Electioneer.

Campbell's Electioneer, alive, and had four foals by Electioneer.

Rosemont, alive, and had three foals by Electioneer.

Bonita, dead, and had one foal by Electioneer.

Dead and outside mares are represented by twelve Electioneers, living and in catalogue with seventeen.

The three from thoroughbred dams, which are the proportion found by comparison from the totals obtained in the catalogue to be on an equality with ten from trotting-bred, are Palo alto, his dam alive, six by Electioneer; Ansel, his dam dead, one by Electioneer, and Azmoor, his dam alive, five by Electioneer, one in twelve, whereas the proportion of the others is thirteen in twenty-nine.

Since the above was written I have succeeded in finding the Palo Alto catalogue for 1884, and from that and other data in my possession, can establish, with sufficient exactness, the number of thoroughbred mares which have foals by Electioneer, from the time he came to California up to 1885. To obtain an approximation to the truth the catalogue of 1884 and the number of foals by Electioneer from trotting-bred, half-bred and thoroughbred dams were collated. That gave 107 from trotting-bred, twenty-one from half-bred, and fourteen from thoroughbred. But I found that the foals reported under their dams were not sufficient. For instance, Waxy died in 1884. Rivoli, Demirep, Fanny Lewis, Frolic and Sally Gardner, all of which have foals by Electioneer, transformed to the thoroughbred department. With the trotters there was less trouble, neither was it so important to get all of them as it was with the thoroughbreds, as omissions would not be of so much consequence in making comparisons. I was so anxious to obtain every foal from a thoroughbred that catalogues were gone over and over again, and pages of notes which had to be changed in a number of instances were written. I believe that the task would have been shortened by making a trip to Palo Alto and copying from the books, and shall do so at some future period, one of the motives being to verify the figures I have "dug out" with a good deal of work. The result of that labor is that I find that previous to 1885 the following listed mares have foals by Electioneer, and the dates of their birth: Annette, by Lexington, one. 1880; Blarney, by Blarneystone, one, 1882; Camilla Verso, by Lodi, two, 1882–83; Cuba, by imp. Australian, one, 1883; Sallie Gardner, by Vandel, one, 1879; Emma Robson, by Woodburn, two, 1882–84; Esther, by Express, two, 1881–82; Fanny Lewis, by imp. Buckden, two, 1881–83; Mamie C. by imp. Hercules, two, 1882–83; Miss Campbell, by Endorser, two, 1881–82; Mollie Shelton, by Rifleman, one, 1882; Hattie Hawthorne, one, 1880; Waxy, by Lexington, one, 1880; Tippera, by Tipperary, one, 1882; Dame Winnie, by Planet, two, 1882–83; Lizzie Whips, by Enquirer, one, 1880; Florence Anderson; by Enquirer, one, 1880; Demirep, by Melbourne Jr., one, 1881; Frolic, by Thunder, one, 1882; Piney Lewis, by Endorser, two, 1882–83; Rivulet, by Rivoli, two, 1880–81; Miss Peyton, by imp. Glengarry, 1881–82–83; Eliza Dolph, by Wildidle, two, 1882–83. Twenty-three mares and thirty-three foals, sixteen colts, seventeen fillies.

Knowing that when Governor Stanford commenced breeding thoroughbred mares

Digitized by Google

to his trotting stallions he was mainly looking to obtain half-bred mares to place in the stud, I was not surprised to find that a majority of the colts were gelded and then sold, and that the fillies were placed in the breeding paddocks. As nearly as I can follow the history of the first of the Electioneer from thoroughbred dams it is as follows: Annette's colt, Ansel, obtained a record of 2:20, and is the sire of three in the list. Camilla Verso had two fillies; one died young, the other I can not trace. Sallie Gardner's filly, Eleanor, was put in the stud at five. Cuba's one colt, Cubic, was gelded and got a record of 2:28½. Emma Robson had a colt and a filly, the colt gelded, the filly Emaline, 2:27½, and put in the stud at five years. Esther, a filly, Extra, put in the stud at four years, a colt, Express, 2:21, gelded. Fanny Lewis, two; Laura C. put in the stud when four years, the colt sold when young. Mamie C., two; the colt Azmoor, 2:20½, the sire of Rowena, one of the crack yearlings of last year; the filly Madeline, put in the stud at four years. Miss Campbell, two; both gelded and sold. Mollie Shelton's filly, Miss Shelton, put in the stud at four years, and died the same year. Waxy's filly, Wave, put in stud at four years. Tippera's filly, Thalia, put in the stud at four years. Dame Winnie's, two; Palo Alto 2:08¾; Gertrude Russell, 2:23½. Lizzie Whips' son, Whips, 2:27½, and the sire of Navidad, 2:22½. Warlock, 2:28¼, and it is worthy of note that Navidad is the only one of his dam's colts since Santa Claus that has a record, though she had one by Strathmore, and five by Electioneer, and the only one from the dam of Warlock, Nellie Walker, is the single pacer, Peruvian Bitters, to the credit of Electioneer, though she had colts by Dictator, Gen. Benton, Mohawk Chief and Clay. Frolic's colt, Del Monte, was gelded, and I do not find further trace of him. Piney Lewis, two; the bay colt died young, her daughter Piney put in the stud at three years. Rivulet, two; her daughter Rachel put in the stud at four years; the son gelded and sold. Miss Peyton had three; Peyton gelded and sold; he showed a trial in Sacramento when three years old of 2:27, tore his quarter off and had to be thrown up; her second I can not trace; her third, Pepin, foaled 1884, is reported in the catalogue of 1886 gelded (dead). Eliza Dolph had two fillies; Aldeana, 1882, was put in the stud in 1889, bred to Beverly, Piedmont and Truman, and trotted to her record of 2:25 in 1891. Edna was put in the stud at five years and is now dead. Blarney's colt gelded and died. Hattie Hawthorne gelded and sold. Demirep's one filly died before she was three years old, and Florence Anderson's sold young. Recapitulation's sixteen colts, eleven gelded. Four stallions, records 2:08¾, 2:20, 2:20½, 2:27½, two of them in the "Great Table," the oldest colts of Palo Alto foaled in 1890, and the oldest of Azmoor's foaled in 1890. Two geldings, records 2:21, 2:28½. Of the seventeen fillies three died young, two in the stud, two untraced, three with records 2:23½, 2:25, 2:27½. Seven of the thirty-three dead, most of the geldings sold when young, but every filly, excepting one, by Electioneer, from thoroughbred mares retained, and every one which lived to a proper age put into the breeding ranks.

In order to show more distinctly the results of the six years following the advent of Electioneer, tables are appended showing the number of foals he got from thoroughbred and trotting-bred dams, and the records obtained in 2:30 or better. That is of Palo Alto breeding. I am nearly positive that the only thoroughbred mares having colts by Electioneer during that period were owned by Governor Stanford, through a number of trotting-bred and a very few half-breds, I only know positively of one more "outside" mare. Therefore, it is safe to say that the list as given embraces all the thoroughbred division. Twenty-three mares, thirty-three foals for thoroughbreds; fifty-seven mares, 107 foals from trotting-bred.

FROM THOROUGHBRED DAMS.

Proportion gives the race, though it is very close, to the thoroughbreds, 33:9::107=30. Nearly two less than there should be when the number of foals is the groundwork for the calculation. Then if fifty-seven trotting-bred mares give twenty-seven with records of 2:30 or better, how many should twenty-three thoroughbred mares give from the same horse? A few years ago, suppose in 1878, when Gov. Stanford commenced breeding thoroughbred mares to Electioneer, the question had been put, ninety per cent of the questioned would have considered it too silly to require an answer, nine per cent given a "guess," the one "thoroughbred crank," and I am perfectly willing to answer to that appellation, and therefore answer for myself, the date of the query being 1878, that there would be a fair proportion, provided the selection was made with good judgment. There were many difficulties in the way which were not in the road with trotting-bred dams. Form on an equality, and as in my four years' acquaintance, previous to 1878, with Governor Stanford, I had learned that he was second to no one I had ever met in respect to knowledge of the proper form for rapidity of movement, and all the other points which are apparent to the eye, would have felt confident that were the selections made by him that would be satisfactorily accomplished. Action is one of the main points in a broodmare, and to guide the choice in that respect there is small opportunity in comparison to what is offered by the trotting-bred and trotting-educated division. Heredity, in the line of trotting ancestry is necessarily presented to a limited extent, but to balance these drawbacks superiority of form for rapid locomotion at any gait, greater nerve force, a higher degree of intelligence and a *better* disposition, if the educator be competent, than in any other breed of horses.

In 1858 I would have quoted Fanny

Digitized by Google

Kemble, "That none but thoroughbreds do it quite well;" in 1868, that the thoroughbred was a potent factor in fast trotting and could be made still greater, and in 1878, with the knowledge gained, and considering the "*plant*" which Governor Stanford had for the breeding and education of trotters, that the infusion of fresh strains of thoroughbred *must* prove beneficial. I felt assured that the experiments then instituted would decide the question, that is, if failure resulted, that would end, for a time, the controversy, and that "running-bred foolishness receive a staggering blow if not a knock out;" and if successful there would be a fresh onslaught, denials of what was firmly established, a fair warfare on the part of a great many who write anent trotting affairs, and evasions and perversions on the part of others.

And now for the answer which the close of 1891 enables me to present, sustained by the stern logic of facts, an arithmetical exposition: 57:27::23=10.9, and that would show an inferiority even if nothing like so great as was anticipated before the trial was made. That would be on the assumption that the foals were equal, and in that case there would be forty-three to represent the twenty-three mares. Calling on the rule again for comparison it would stand: If fifty-seven mares give 107 foals, how many should twenty-three give? 57:107::23=43, and then one more equation will end this branch of ciphering. If thirty-three foals give nine with records of 2:30 or better, what will forty-three give? 33:9::43=11.7, a shade better than the proportion demanded.

In entering these comparisons it must be clearly understood that it is not with the intention of disparaging the trotting-bred mares. The tables presented show that they have done wonderfully well, and few will deny that twenty-seven 2:30 or better performers in a total of 107 foals and twenty-two dams in a total of fifty-seven are returns not often excelled. My object is to place all of them in a position that will enable students of trotting-horse problems to get a fair view of all sides of the question, to lay before them facts, and while my lifelong advocacy of the efficacy of racing blood in the breeding of fast trotters may sway my judgment and lead to presenting that side of the question in as favorable a light as possible, I shall not, knowingly, offer evidence that is not trustworthy or suppress testimony that will weaken what may be termed, my side of the case. The question which is one of great moment to the breeders of fast trotters is that which lies at the very foundation of the business, viz.: How to secure the blood which will give the best return. That it is and always will be a mooted point, is absolutely certain, and the contentions will never cease so long as trotters are bred, trained and trotted. The side I advocate has, for a long time, carried an onerous handicap, and when arguments were not forthcoming, ridicule, abuse, denials of facts which would carry conviction to any fair-minded person, perversions and twistings—all manner of subterfuges to mislead. I am pleased to say that so far your magazine is not chargeable with a shadow of unfairness, and in calling attention to what I consider an error in the foundation of your argument do not imply that there was a lack of candor; in fact, a person who had the last Palo Alto catalogue for the groundwork and did not go into an exhaustive analysis would come to the same conclusion.

Furthermore I will say that in giving the preference to trotting-bred dams for producing "early trotters" you are fully sustained by the records, and though explanations could be made and reasons given for this falling off of the progeny of thoroughbred dams, other than inability to acquire the fast trotting step in their early colthood, these should not be allowed to balance what has been done.

I will also acknowledge that in choosing the period from 1878 to 1884 to exemplify the relative positions of the two classes one of my motives was that such course would be farther away from "colt-trotting," and another that it would lessen the labor of collating the evidence. Your position in regard to that feature was intrenched so well and so strongly guarded that there was no chance for a successful attack. But intimately as I have been acquainted with the breeding operations at Palo Alto, I had a very

Digitized by Google

erroneous idea in regard to the thoroughbred mares which were coupled with Electioneer. I was under the impression that a comparatively small proportion were foaled previous to 1885, and that in the six years from 1879, when the first was foaled, until 1885, there would not be to excel thirty per cent of the whole number. As said before, I thought the labor would be less, and when the 1884 catalogue was found, that there would be little trouble in completing the job. The first intimation of mistaken impression was made through finding only two foals on the list for 1884. Thinking that so small a representation was due to an error in copying, a different table was made, and that proved the original entry correct. The revise gave thirty thoroughbred mares in all which had foals by Electioneer, and sixty-one was the total of the offspring distributed as follows: 1879, 1; 1880, 7; 1881, 5; 1882, 10; 1883, 8; 1884, 2; 1885, 2; 1886, 5; 1887, 5; 1888, 5; 1889, 4; 1890, 3; 1891, 4. Thirty-three in the period selected, twenty-eight for the balance of the time. Then in place of a less arduous task the labor was greatly increased by taking the earlier catalogues as sufficient for exemplification of the period preceding them. For instance, in the catalogue of 1884 many of the thoroughbred mares were not listed, and in that of 1885 differences from later catalogues. In that Blarney is given, "February 20, 1882, b. c. (gelded) by Bentonian." In subsequent catalogues the 1882 foal is credited to Electioneer, and in order that if errors are made they shall not favor thoroughbreds, I follow the later. Which is correct can be told only by the books. The latest of the get of Electioneer from thoroughbred mares to obtain a place in the list is Linnet, a sister of Whips, and she is the only three-year-old from a thoroughbred to obtain the place. As stated before your position in regard to "early trotters" is impregnable, and while there are, in my opinion, good reasons for the "half-and-half" not making a more creditable showing in that line, I shall not present opinions as an offset to facts. But up to and including the foals of 1888, there were forty-nine foals. The additions to the list being Linnet, three years, 2:29½; Emma R., from Emma Robson, four years, 2:28½, and Hugo, from Helpmate, four years, 2:27½. These and Palo Alto's four-year old race record of 2:20¼ are the only colt trotters by Electioneer from thoroughbred dams. What the future may show is only conjecture.

In conclusion I will give my table based upon relative proportion admitting that in the column of "Average age" I am "not in it." As you have averaged the time as well as ages no fault can be found with a "striking an average" on the basis of relative numbers.

Dams.	Average Record.
Half-thoroughbred	2:15.45
Thoroughbred	2:16.41½
Trotting-bred	2:16.55

As there are only four foals from pacing mares [See explanation below. Ed. Monthly], one with a record, they can not be incorporated. As to extreme speed when the record is abandoned, that is only a matter of conjecture. That Arion's mark, 2:10¾, two years, is the most startling of any, I freely admit, and that Sunol's 2:10½, three years old, was an indication that she would lower the record, was followed by doing it. That she will go lower I also believe, and shall look for Arion to go below any figure which has yet been made. There are other lessons which Palo Alto has placed before the students of the trotting-horse breeding problem, and these of sufficient value to justify a full course of lectures, and your magazine the proper place for illustration.

Truly yours,

Joseph Cairn Simpson.

Oakland, Cal., March 21, 1892.

[It is the duty of the editor of the Monthly in the interest of a fair discussion of the subject in hand to call attention to certain facts. In the first place it should be remembered that the article to which Mr. Simpson refers was headed "Trotting-bred Mares Lead," and that all through it the different classes of mares are spoken of as "trotting-bred," "running-bred," "half-thoroughbred," etc. The fact that at one point in the article a sentence read "the fastest ten from pacing mares" on the face of it carried the idea that pacing-bred mares were

Digitized by Google

meant, just as trotting-bred mares had been referred to in other parts of the article. Therefore Mr. Simpson's contention that the conclusions reached were misleading ones, because the mares referred to did not, perhaps, in all instances pace, is absurd and unworthy of him. His remarks in the paragraph on this point will hardly stand the test of investigation. For instance he says "the dam of Manzanita and Wildflower had a trotting record of 2:30½." This is true, but it does not at all alter the fact that their natural gait, so far as that goes, was as much pacing as trotting, and that they were induced to trot only by the use of heavy weight on their front feet. However, that is not the contention. The idea sought to be conveyed in the March MONTHLY was that Manzanita and Wildflower were from a pacing-bred mare. Let us see what the records say. Their dam appears in the Great Brood Mare table as Mayflower, and she is by the pacer, St. Clair 16675. Her dam's breeding is unknown, and therefore so far as her blood lines have been discovered, Mayflower is pacing-bred and nothing else. Mr. Simpson says that "the dam of Bonita (had) a trotting record of 2:30¼." By again consulting the records it is found that the dam of Bonita was Mayfly, by the pacer St. Clair 16675, and that her breeding in the maternal line is unknown, so that like Mayflower she is pacing-bred. Again Mr. Simpson says: "The dam of Ladywell was by the trotter Fred Low." The Year Book gives the dam of Ladywell as Lady Low, by a son of the pacer St. Clair, but letting Mr. Simpson's statement that she was by Fred Low stand, a reference to the records shows that Fred Low was a son of St. Clair and out of a mare of unknown breeding. The second dam of Ladywell was by Doc, and this horse Doc was by St. Clair 16675, and out of a mare of unknown breeding. The dam of Fay was by Fred Low, descended from the pacer St. Clair, as stated above. "The dam of Fred Crocker was not a pacer," says Mr. Simpson, "and Aleck B. was by the trotter George Lancaster." Let us see. The dam of Fred Crocker, according to the records, was Melinche, by St. Clair, and the dam of Aleck B. was by George Lancaster, as stated, she being out of Melinche, by St. Clair 16675. George Lancaster may have been a trotter, but his name does not appear in the 2:30 list, nor is he mentioned in Chester's Guide as the possessor of any record whatever.—EDITOR MONTHLY.]

ABOUT THE CLAY FAMILY.

EDITOR OF THE MONTHLY:

I comply with your request by writing what I know as to the Clay family of horses that were owned in this part of New York.

Old Henry Clay was a black stallion with right hind foot white, and a large star the shape of a half moon. He was fifteen and a quarter hands high, foaled June, 1837, and died April, 1867; bred by Jacob S. Platt, Long Island. He was a nervous, active horse, a very fast walker, and one of the fastest trotting stallions of his day. When aged he became blind and his neck broke over on the top and hung down, so that in his old days he could not be called a beauty, and many breeders condemned him until they saw his wonderful trotting powers. Henry Clay, as the public knows, was sired by Andrew Jackson, a very fast trotting stallion; he by the gray stallion Young Bashaw; he by the imp. Barb gray stallion Grand Bashaw. The dam of Young Bashaw was a thoroughbred mare by First Consul; second dam Fancy, by imp. Messenger. The dam of Henry Clay was the noted trotting mare Surrey Lady, she being the fastest horse of her day at two and three-mile heats. The dam of Andrew Jackson was a Canadian pacing mare. The old stud bills of Henry Clay read: "The dam of Andrew Jackson was by the well-bred horse Why Not, and Why Not by the well-known horse Old Messenger." The grandam of Andrew Jackson was also by Old Messenger. Andrew Jackson, the sire of Henry Clay, sired Long Island Blackhawk out of a mare by

Digitized by Google

Mambrino, son of Messenger. Long Island Blackhawk was the first horse to trot in 2:40 to a wagon.

In Henry Clay's day we did not have trotting-bred broodmares, but he sired three in the 2:30 list, one of these in 2:25. There were many stallion sons of old Henry Clay in this (Ontario) county, but their dams were common farm mares, and Clay blood then was like sawdust in oats, the less the better, so these stallions had no chance until they got very old, and then Randolph Huntington proved without doubt that the dam of the stallion (George Wilkes) that had trotted to a wagon a quarter in twenty-nine seconds was sired by Henry Clay. After this the breeders of every stock farm in America wanted Clay blood. Rushmore, a stallion son of old Henry Clay, was bred in this town, and, I think, foaled in 1864. When Rushmore was coming three years old I went to buy him. The price then was $200, but there were certain points about the horse that I did not like, though he proved to be very good gaited when aged. I paid $200 for a daughter of Henry Clay the same day. Rushmore was sold to the Jewett farm, it was said, for $2,500; the Clay boom had then come. Clarkson Aldrich, one of my neighbors, had a pair of stallions that he drove to the pole, sired by Henry Clay. One was a black with star and snip, the other a bay. They were small, but one of the best road teams ever seen. He took them to New York and did not have to wait long to get an offer of $3,500, his price being $5,000, but the horses were almost too small for that price; he let the people in New York see that Henry Clay sired trotters, then shipped the team home and drove them for many years. Their owner was a careful horseman and a good driver. When the team was twenty-one years old he drove them from this county to the Jewett farm at Buffalo, a distance of 100 miles. On reaching the Jewett farm a well-known writer on turf topics took a spin behind the team and pronounced them the fastest pair of their age in the world.

There was another pair of stallions here sired by Henry Clay that were driven to the pole. They were owned by Jacob Bowers, who was all horse. He once had charge of old Henry Clay. Bowers was a little deaf. A member of his family was sick and he drove a Clay mare to the village of Victor to get the doctor. Some one stepped up to ask him about his sick family; he supposed they were talking horse, and his answer was that "she could trot like the devil." These horses were black, one with a star and snip, the Clay mark, the other with no marks. They were about fifteen and a quarter hands high. The one without marks was called Moose, and he looked like one. I think he was the result of Henry being bred to his own daughter. Moose was pot-bellied, flat ribbed, short-necked, steep-rumped, coarse head and ear, hind legs like a sickle, very crooked, but sound. He was never a well horse, but if ever there was a natural trotter foaled, this was one of them. He could go like a bullet at a pure trot, and it was worth a long journey to see "Jake," as they called him, drive them on the track and watch eight black legs moving with lightning speed, the front legs and feet pawing the air. This perhaps was one fault of the get of Henry Clay—they had too much knee action. It is the low, long stride, the stealing gait, that gets over the mile first. I have seen many great trotters, but I shall never forget Jacob Bowers and his black Clay stallions as I stood in front of them when they were being driven one 4th of July on the Palmyra track. I got excited and bred a pair of mares the next day, and I have mentioned this pair many times since to my friends who were there with me, when they have been talking about old days. One of this pair of stallions, the one with the star and snip, was bred by a man that did not take very good care of his stock. This colt was over-driven and abused, but proved to be a trotting wonder for those days. With Uncle Jake's care after he got them together he put them in shape to sell, and a Mr. Frank Fox purchased them and shipped them East. Moose died not long after that I believe; the other stallion was sent to Boston, and it was said he was one of the fastest road horses in that city. His dam was a thor-

Digitized by Google

oughbred running mare, which probably accounts for the endurance. Another stallion here sired by Henry Clay was Fashion, a black with white face. This was a perfect formed horse, but never trained for speed. His get made very good road and general purpose horses. There was a bay stallion here sired by Henry Clay; he had a blaze face and four white legs; was called Chronometer and was quite a trotter. He went to Maryland and some of his colts were trotters. The last one of the sons of Henry Clay owned here died about a year ago at Victor, N. Y. He was called Hank Clay, and was one of the largest of his sire's get. He was a black with large star and snip, a chip of the old block, speed, temper and all. There was a pair of roan geldings here sired by Henry Clay that were trotters and were sold for $2,000 to go to New York. A village paper of the time said: "Our citizens have often had occasion to notice and admire a pair of fast-going roan horses, owned by M. D. Munger, of this village. They are half-brothers, having been sired by old Henry Clay and possessing in an eminent degree the distinguishing characteristics of that noble animal. They are four and five years old, named respectively Henry Clay and General Grant. The former was bred by Joshua Phillips, of Bristol, and the latter by Hiram Crooks, of Richmond. Their new owner, G. G. Reed, purchased them for the handsome sum of $5,000, and we believe he designs taking them to New York, and we venture the prediction that before many months have passed they will be found capable of taking the lead of any trotting team in the city. Their owner authorizes us to say that he will match them against any pair of green horses of their age for the sum of $5,000." The Phillips colt was said to be a full brother to the dam of George Wilkes. This pair had wonderful trotting action, but, like the St. Lawrence family, too much knee action. The two-minute trotter will not paw the air, but must step long and low and be a line trotter. If Henry Clay could have had such mares as are now common, his get would have astonished the trotting world. As something doesn't generally come from nothing, we must give Henry credit for this wonderful trotting gait in his get, for he was bred to nothing but common farm mares. Clay broodmares have produced some of the best stallions in the land. The Hambletonian-Star stallion Artemas had but three or four in the 2:30 list until lately. He made two seasons here in Ontario county, covered some Clay mares, and the colts are born trotters. There is a mare here sired by Artemas, dam by Andy Johnson, son of Henry Clay. This mare has trotted a quarter in thirty-five seconds. I bred a stallion by Artemas from a Clay mare; he trotted in 2:32 with eight weeks' training.

There have been owned in this county St. Lawrence stallions, Clays, Stars, Hambletonians, Mambrinos, Royal Georges, Champions, Morgans, Black Hawks, Tippoo Sultans, and two with a Pilot Jr. cross, but the most successful sire of 2:30 speed owned here was Gooding's Champion, that has seventeen in the list and a large number with records under 2:40, most of them from mares of unknown breeding. One of his sons, Castle Boy 2:21, fought some great battles down the Grand Circuit. The daughters of Gooding's Champion have proved very good broodmares. Colonel Wood, said to be the fastest trotter in Germany and Austria, is an inbred Champion. Many of the Champions are fast trotters and very good road horses, most of them good lookers, but none of them has a record under 2:20, although Naiad Queen, by Gooding's Champion, trotted half a mile in a race in 1:04. Novelty, by Gooding's Champion, went half a mile in a race in 1:05. Grinnell's Champion, Hambletonian 10, Henry Clay 8, American Star 14, Mambrino Chief 11 and Abdallah 1, all trace back to the gray stallion, imp. Messenger; were all bred in New York state, and there is not a state in the Union where trotters are bred but that has descendants of these great horses. Our best bred trotters will sell for more money than has yet been paid for a trotting horse, and I predict that people now alive will see the sum of $5,000 paid for the service of a trotting stallion. Arion now stands at half this amount. The young breeder of to-day will also see the two-minute trotter. I

believe that blood will tell, and it always crops out in time. I also believe in the standard, but we must breed from the very best of the standard ones. No man has yet lived so long that he can not learn more about the great breeding problem. What we now want is breeders who are not prejudiced. Breed to the stallion that has the most speed, beauty and size from either of the great trotting families. Do not be selfish enough to think your own horses are all pure gold and your neighbors' are nothing but lead and dross. I have read most of the turf journals, and one can not but take an interest in the many letters written by their correspondents. One breeder is sweet on the Clay family, another wants Hambletonian and none of the Clay sawdust, but they are both making a sad mistake. Life is short, no time to experiment. We that have lived to see must admit that these are now our two leading families, but our fastest and most enduring campaigners have the stout Star, Mambrino and Pilot Jr. blood in their veins. Belle Hamlin, 2:12¾, and Alvin, 2:14, have a cross of the stout Royal George blood in their veins. Alexander, 2:19, winner of the $10,000 stallion race at Rochester in 1881, was a Clay and St. Lawrence. All these great performers prove that we must, if we are honest, give credit to each and every one of the different trotting breeds.

The sons of Henry Clay that were owned here had level heads and were honest trotters, but I have seen his daughters that would froth at the mouth and pull a man's arms off if he drove far enough. They were full of the stuff that made great horses, were about fifteen hands high, but all horse and as springy as a ball of rubber. Mr. George Holdridge, now of the Jewett stock farm and one of the best horsemen ever in Ontario county, had a bay daughter of old Henry Clay that was from a Nimrod mare and that was a terror. She was known as the Gardner Mason mare, and was bred by one of my neighbors, a gentleman of that name. He tried patiently a long time to make a trotter of her. She could almost fly on a trot when alone, but in company was worthless. When Mason went to Buffalo he tried to sell me this mare and advised me to breed her to Gooding's Champion, but I then had a daughter of old Henry Clay that was from a Nimrod mare, and that would trot all day at any kind of farm work. I used her with patience, however, never put a check on her, and had no trouble. Both Henry Clay and Gooding's Champion had plenty of temper, and I thought then, as I now do, that the Holdridge mare was not the proper cross. She, I believe, ran away in Rochester, butted her head against a hitching post and was killed. Another daughter of Henry Clay was owned here by Dr. Bennett. She was a black with star and snip and low build. The doctor was said to be the strongest man in the village of Canandaigua, where he lived. He was a good feeder and did his own driving, but when the mare began to get warm and pull, he had to call on his man to help hold her. If these daughters of old Henry Clay could have been bred to Hambletonian 10, with his level head and pure trotting gait, we should perhaps now have more such horses as George Wilkes and Electioneer. It is claimed by some that Dexter was a Clay horse. One writer said that Hiram Woodruff advised him to breed a mare to Harry Clay and not to Hambletonian, because Harry Clay sired Dexter. Woodruff in his book says that Dexter was sired by Hambletonian and I agree with him, for Hambletonian was bred to Dexter's dam and got Dictator, the sire of Phallas, 2:13¾; Jay-Eye-See, 2:10, and Director, 2:17, the latter the sire of Direct, 2:06, the fastest pacer in the world. I once had the pleasure of calling on Randolph Huntington at his stables in Rochester, and I can not speak in high enough praise of his beautiful Arab and Clay horses. He had a picture of Harry Clay and what he called his son Dexter. Each had four white legs and a white face, but I believe Dexter's grandam had the same marks. Seeley's American Star, the sire of Dexter's first dam, had a white face and white hind legs. Rysdyk's Hambletonian had two white hind feet, and I think we can hardly prove Dexter's sire by his marks. Dexter was one of the greatest trotters ever

Digitized by Google

foaled, and it was a sad mistake that he was not kept an entire horse. I will admit that the pictures of Harry Clay and Dexter resemble each other, but the breeder of Dexter, Jonathan Hawkins, stood up and took his oath on the Bible that Dexter was sired by Rysdyk's Hambletonian.

Some of our most noted breeders advocate running blood in the trotter. Do you think Arion would have sold for what he did, $125,000, if he had been a half-bred horse? I think not. Breed Arion to a mare that is bred as well as he is and then we have what is called a thoroughbred trotting-bred trotter, and it will not be unreasonable to think we can soon have a colt with fifty or even 100 trotting crosses. We have only just commenced to accomplish what will be done in breeding that most useful of all horses, the great American trotter, the horse that can do anything and everything that can be done with any horse for a general purpose horse, a gentleman's driving horse, for an agricultural horse, a turf horse or a saddle horse. There is no place you can name that the trotter does not fill the bill. For the average farmer there is no horse that can compare with him.

STEPHEN W. SMITH.

Padelfords, N. Y.

PROBLEMS IN FARRIERY.

BY S. T. H.

Further Observations on Leveling the Foot.

IN a recent number of the *American Trotter* appears a choleric communication from a writer who subscribes his official importance as the "Professor of the Department of Veterinary Science of the Agricultural College of Mississippi." It is intended to be a caustic refutation of the methods set forth in a previous paper of accurately leveling the foot by the aid of the compass. In retaliation for the exposè of the inefficiency of veterinary scientists on the proper methods of dressing the hoof, he indulges in many harsh expressions that never call into requisition from the author either breeding of approved refinement or intellect of a high order. Such rude personalities may be in accord with the vehemence of slum argumentation, but they are as unworthy of the dignity of a college professor as they are ungermain to the subject at issue. Passing them over with this general mention, the strictures that are relevant deserve *seriatim* consideration, because they may enable the writer to further elucidate this important subject for the benefit of the horse community. It is difficult to convey instruction fully on an abstruse or scientific subject merely by the use of words, even though language may be marshaled so as to convey to many readers an absolutely clear statement. Diagrams are always forcible aids to expression in any specialty. It is well that the nineteenth century is the pictorial age. By the use of free-hand drawings, pen-and-ink sketches, wood cuts and photogravures, many a thought that to some minds is involved in perplexity when expressed in words becomes as clear as sunlight when pictorially illustrated. This especially applies to instructions relating to the horse's foot. Ocular demonstration with the green foot in hand is the most potent, a well-drawn diagram the next, and mere unaided words the feeblest of all modes of expression. Still they may be used to convey to the great majority of students the mechanical principles herein designed to be presented for the proper leveling and balancing of the foot of the horse. The professor interposes three objections to the use of the compass.

1. The writer's instruction is thus quoted: "Place the point of one branch "or arm of the ordinary compass of "mechanics at the ground surface of the "wall at the extreme heel and the point "of the other arm where the wall and "hair unite, at the coronet. This will "give the exact height of one heel. The "arms of the compass must then be "screwed tightly to this measurement,

Digitized by Google

"and, thus fixed, must be applied to the "other heel, the only precaution necessary being that the compass shall be "held precisely in the same position, "either laterally or perpendicularly while "both measurements are being taken."

The reviewer then proceeds:

"This might be good theory were the "heels of both feet *or the parts of the* "*same heel* usually alike, but that is very "seldom the case."

What is meant by the ambiguous expression, *or the parts of the same heel*, is beyond construction. That the heels of both feet are usually alike is certainly very seldom, simply because they are dressed without reference to any measurement that would make them either the same height, or the same length, or distance, from the extreme point of the toe. This difference, however, does not arise from a normal, but an abnormal, dissimilarity, produced by defective shoeing, and the absence of specific instructions from the veterinary surgeon to the operating smith.

The professor further objects: "The "hair does not grow the same on both "sides of the same heel, much less on "the heels of different feet."

To make a clear statement is one of the greatest advantages enjoyed by a mind that has been trained by a collegiate education. Not to make a perfectly clear statement, especially by a college professor, is an intellectual crime. There are two heels to each foot. What the professor means by the expression that "*the hair does not grow the same on both sides of the same heel*," is beyond comprehension, as there is only one side, and that the outside, of the heel, *above* which the hair grows, and in contact with which the measurement indicated has any reference. There is positively no hair on the heels. Nothing but horn, the hair growing only down to the line of demarcation between the flesh and the hoof at the coronet. "Much less," continues the professor, "does the hair grow the same on the heels of different feet." To be precise, the hair grows down to the line of demarcation above indicated. That line is lower down on the heels of the hind feet than on those of the front feet, but the law of growth regulating the hair is precisely the same on both feet. The hair grows down to the line at the coronary band, no higher and no lower, unless the horse has repeatedly grabbed his quarters and destroyed the follicles, so that no hair can grow immediately above the injured heel. If the foot is afflicted with an uneven or raised coronet, resulting from local atrophy, or ossified cartilage, or long continued uneven paring of the branches of the wall, then the heels can not be made precisely the same height without throwing the wall out of level. But this does not militate against the method of measurement, which is designed to operate only upon normal hoofs.

Abnormal feet always demand specific treatment. That the coronet, unduly elevated on one side, can be drawn down, and the foot again placed upon a level foundation is beyond question. If, for instance, the wall on the side afflicted with the raised coronet, is pared down at each dressing a trifle lower than on the other branch of the foot, and then an exceedingly strong shoe of a broad, stiff web is used, being nailed on to the normal side first, and then gradually nailed on to the abnormal side with nails reaching from the forward arch of the quarter to the extreme heel, by tapping first one nail and then another, and so on all along the line, to the extreme end, and then repeating the operation till the wall is gradually drawn down to the heavy shoe, the raised coronet can thus be reduced. But the foot must be made exceedingly soft and yielding, by poultices and wet swabs around the coronet, for several days before and after each operation. Then the horse can be used, in his ordinary work, for three weeks, when the shoes must be set, and the same operation repeated. But care must be taken to draw down the coronet not more than a sixteenth of an inch at each shoeing, and the hoof must be specially softened for the treatment. Thus the raised coronet, resulting either from guittor, quarter grabbing, or, more generally, from not reducing both branches of the wall to the same height, through a long series of shoeings, can be restored to its normal position. When the coronet is thus correct in position,

Digitized by Google

and the quarters are uninjured, the hair always grows down to the same line above both the outside and the inside heels; that is to the line of demarcation, at the coronet, between the horn and the flesh. Nature makes no mistake in its clothing the lower pastern, on both sides, thus alike, with hair. Ocular demonstration will determine this matter to any observer, and it needs no further elucidation in this paper.

The professor complains that "the line "of demarcation is not sufficiently well "marked to render accuracy possible, and "it will require more intelligent care than "blacksmiths possess to be certain that "the compass shall be held precisely in "the same position, either laterally or "perpendicularly, while both measure-"ments are being taken." It is well that, in all controversies relating to the anatomy and physiology of the horse's foot, the great jury of the turf public has sufficient knowledge and capacity to detect truth from error, and to discriminate between just criticism and unjust hypercriticism. Two more simple statements, in the imbecile sense of the term, could not be coupled together than those just quoted from the professor. If the line of demarcation is not sufficiently well marked between hair and horn, two substances as opposite in texture and to the sense of touch as any two substances in nature not armed with thorns, can well be designated, then the observation of the reviewer is sound and tenable. If the ordinary smith who can point and drive a nail without pricking the sensitive portions of the foot, *and who can hold the compass in the required direction to measure one heel, can not hold it in the same direction to measure the other heel*, then this method of leveling the wall is attended with so much mechanical skill as to lie beyond the capacity of the average horse shoer. Objections of this calibre seem to be so envious in spirit and insignificant in character that the mere mention of them reflects with ludicrous abashment upon their author. Instead of denouncing a method of leveling the walls, by decrying the incapacity of the workman to apply it, would it not have been more worthy of a scientific teacher in this specialty to have contributed his quota of instruction to both the students in his department, and to the smiths who dress and shoe "the few hundred feet each year" that come under his professional examination, by an occular demonstration, with the compass in the grasp of his precise digits, just how to hold it in the same position, either laterally or perpendicularly while the heels of both front feet are being accurately reduced to the same height? Practical instruction thus imparted would be of more service to the horse, to the students and to the smiths, than tomes of lectures on pathological horse-shoeing from the didactic desks of the various veterinary colleges both at home and abroad.

Following out the perversity of confusing the abnormally shaped hoof with the normal one, he observes that "the heels "seldom descend from the coronet at the "same angle; hence the same measure-"ment must of necessity give a different "height to the heels." When the hoof is normal in shape, the heels descend at precisely the same angle from the coronet to the ground surface. This measurement is not dependent upon either the positive or negative asseveration of expert or professor. The foot adjuster patented by Mr. William Russell, and presented with explanatory cuts in his work on "Scientific Horse-Shoeing," fully determines this matter. It is made in the form of a horse-shoe, provided with an arm that is attached to the web of the instrument by a hinge. The arm works upon a graduated arc, upon which the slightest variations of a degree from forty-five degrees to naught are carefully engraved. By placing this instrument under the foot, the movable arm will indicate upon the graduated arc the precise degree of obliquity, whether at the toes, quarters, or heels. In the normal hoof, when the heels are reduced to the same height, by means of the compass measurement, they will not only measure precisely the same distance from the extreme point of the toe, but the "foot adjuster," in all cases, without the slightest variation, will demonstrate that the obliquity of the inside heel is precisely the same as the obliquity or inclination of the outside heel, no more, no less. When the mechanical action of the foot

Digitized by Google

is considered, how could the obliquity vary in the slightest degree without internal injury? The horse lands, in action, upon his heels, revolves over the quarters, and springs from the toes. Now, if the obliquity of the heels varies, that is, if one is slanting and the other is more perpendicular, then they receive the concussion with a diverse capacity of expansion. The more inclined heel will have the greater expansion; and thus by just the excess of its lateral movement be enabled to dissipate the more perfectly the jar and resultant concussion, while the more upright heel will receive the preponderance of concussion and have less capacity to dissipate it, because its more perpendicular position will not admit of the same degree of lateral expansion. At the inside heel the resultant concussion would thus be transmitted more directly up into the sensitive portions of the foot, and corns at the inside heel would not only be the universal result, but the sensitive covering of the navicular bone at its inferior inside surface and end would be thus directly subjected to inflammation by reason of this direct transmission of greater concussion. The abrasion of its surface and fracture of the bone would thereby be more frequently induced. But this does not complete the catalogue of evils. The outer sections of the journals of the joints from the foot to the knee would be more severely shocked than the inner sections, and soreness, or groggyness, amounting to permanent lameness, would be the rule, not the exception, in the front limbs of all horses subjected to the enormous friction and concussion resulting from great flights of speed. The professor has obviously made a serious error. Nature does not work upon such imperfect constructions that thus necessarily entail so much unnecessary suffering. The faculty may be the master of pathological shoeing, but when it enters the smithy for the practical work, it has, invariably, in all countries, shown that lack of mechanical insight into the working of the foot and limb as to be unable to direct its most healthful armament. This can be no matter of wonderment when we remember that Mr. Fleming, the very author our Mississippi professor so much admires, admits that "*the art of farriery in this country (Great Britain) has never received a scientific development, but has ever been a mere affair of routine and tradition.*" This humiliating refrain is taken up by that other great English contemporaneous master of farriery, Professor Gamgee, when he admits that "*veterinarians have long since abandoned farriery and the shoeing forge as the ungentlemanly part of their profession.*"

Can it be truthfully maintained that, outside of the veterinary department of the Agricultural College of Mississippi farriery has received much more scientific attention from the faculty in this country than it has in England?

In abnormal feet there are many instances in which the heels do not descend from the coronet at the same angle. Very frequently the inside heel "wires in," and thus draws the inside quarter straighter. This results almost invariably, from improperly dressing the feet, and may become so chronic as to be transmitted to the progeny, for nothing is so persistently inherited as defective eyes and abnormal feet. Cassius M. Clay (Strader's) 22, had this defect in an aggravated form. It was confined to the inside heel of the off fore foot, and resulted from undue pressure upon the outside heel, arising from dressing the outside branch to a higher level than the inside branch. This practice had been repeated by the same village blacksmith so invariably that the greater pressure upon the outside branch caused it to grow more rapidly than the inside, *and not only a raised coronet, but excessive paddling with the off fore foot was the result.* Obviously, in the case of a foot thus distorted, the compass measurement would not accurately apply, but even then its fixed adjustment would make the foot more nearly level than would the indiscriminate paring and rasping of the smith who produced the deformity. The remedy is worthy of recording in this connection. The foot was pared as near to the level at both heels as the eye could measure, when the upturned foot was held between the hands without twisting either the limb or hoof out of line, and carefully sighted.

Digitized by Google

Then a three-quarter shoe was fitted into the wall after the method prescribed by Chartier, beginning at the outer heel, extending around the toe, and terminating at the center of the inner quarter, leaving the inside heel and bar to bear directly and firmly upon the ground. The inside heel was not "opened up," in the blacksmith's phraseology, by cutting through the horn at the heel, nor was the bar and sole on the inside pared down thin to weaken the inside heel, so as to enable it to spread, as the average smith vainly believes and practices. For this method deprives the inside branch of all strength to withstand further contraction, and the weakened inside heel, slowly yet certainly dries and shrinks into a more narrow compass. But the bar was left strong, and the wall at the heel remained firmly united with the sole, *but the inside commissure was cut down as deep and thin as it is in the untampered colt's foot*, so much so, that the narrow, shriveled frog could be moved easily from side to side, just as the full healthy frog of the colt's foot can thus be manipulated. Daily exercise in a lowland, moist paddock, and confinement at night in a roomy box-stall, floored with yellow clay, with very little bedding, kept the hoof pliant, while constant pressure of the wall and bar and frog upon the inside branch of the hoof gradually brought out the inside heel to its normal width and obliquity. Then, by the aid of the compass, the heels were made mathematically level, because they presented the same obliquity from the coronet to the ground surface.

The raised coronet, as the result of this operation, disappeared. With the restoration of the hoof to its normal proportions had also vanished forever the ugly paddling with the off forefoot and there came in its stead that beautiful, uniform, straightforward precision of his front action for which Strader's Clay in his later years was noted. If the professor from Mississippi had taken charge of this foot among "the few hundred feet he examines each year" he would have undoubtedly repeated the error he presents in the review by saying that "the heels seldom descend from the coronet at the same angle" and he would have impotently left the noble old horse a confirmed paddler, with pain ascending to the sensitive portions of the foot from the heel, thus bent under, at every footfall. But his error becomes more mechanically profound as he proceeds.

To quote from his strictures:

"His method of leveling the quarters "is described as follows: 'Begin at the "center of one quarter and take the "height from the ground surface to the "coronet and you then regulate the "height of both quarters by this fixed "measurement. The quarters will then "be of the same height.'"

Then the professor thus luridly fulminates:

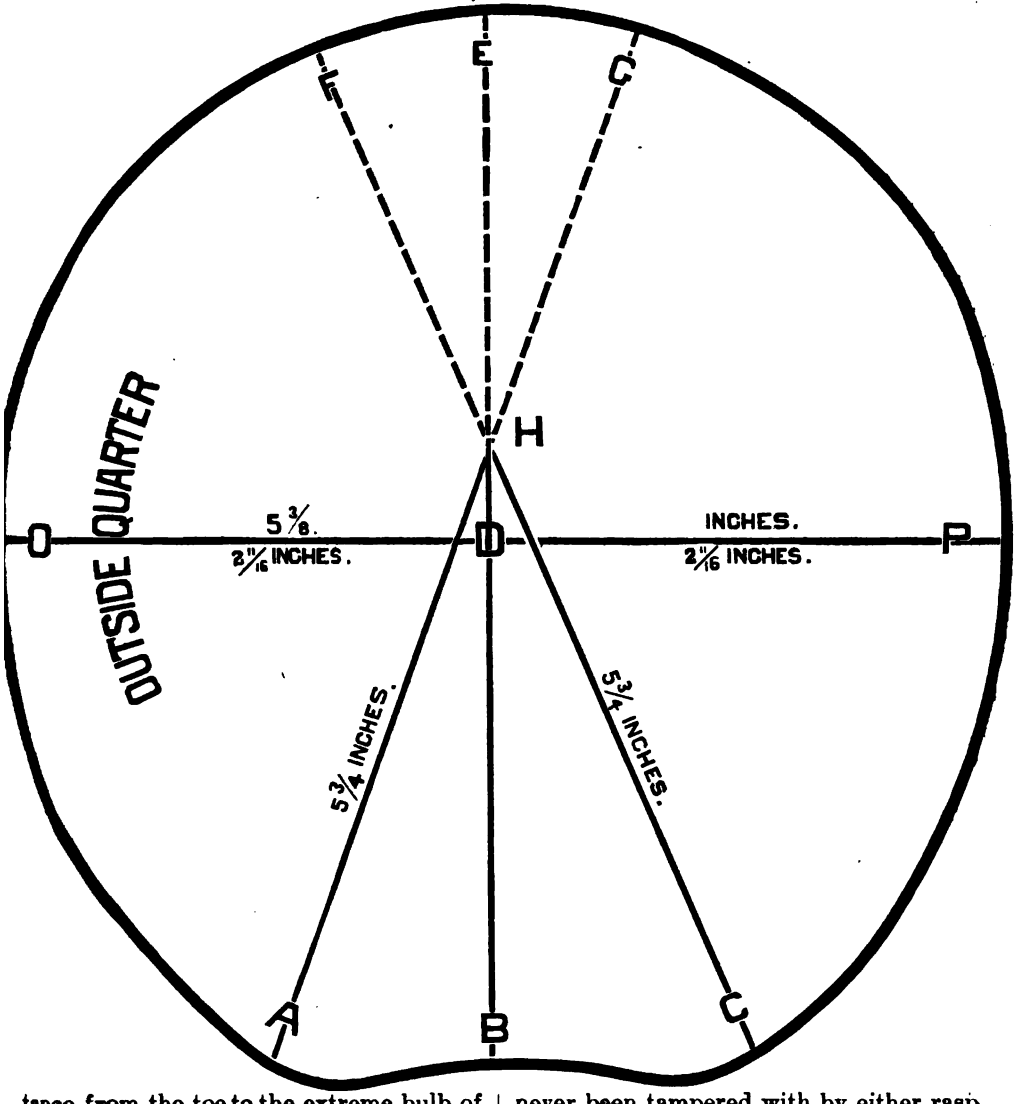
"These are, *perhaps*, the most absurd "statements ever imposed upon a credu-"lous public as science. First, I would "ask, Where is the center of the quarter? "The lateral boundaries of the quarters "are arbitrary lines, and hence the find-"ing of an exact spot that will accurate-"ly represent the center of each quarter "requires greater intelligence on the part "of the smith than he possesses."

Now, please be patient, Mr. Professor, and refrain from pushing your excoriation to the extent of annihilation, either of yourself or the writer. From the fact that you so triumphantly ask, "Where is the center of the quarter?" it is presumable that to find the "exact spot," as you express it, not only "requires greater intelligence on the part of the smith than he possesses," but also greater intelligence on the part of the professor than the master himself enjoys. To the ordinary understanding the center of the quarter is the point of the greatest fullness or breadth across the ground surface of the hoof.

Since the professor asks for detailed information on this point, the subject can be briefly elucidated by means of the odious compass. All feet are not of the same shape. The contour of the hoof is largely regulated by the conformation of the body. The heavy carcass on short, stout limbs and stocky pasterns will have a full, round hoof. The long, drawn-out form of Rarus has a more slender, oblong hoof, but there are certain, relative proportions that never vary, and there are certain measurements that will always

Digitized by Google

determine the center of the quarters. For instance, take a normal green foot and draw a line through the middle of the cleft of the frog and extend it from the extreme heel to the wall at the toe. This is the base line of all accurate measurements of the ground surface of the hoof. Now, with the dividers, fix a point in this base line just one-half the distance from the toe to the extreme bulb of the frog. That will be the center of the ground surface of the foot. Now draw a line at right angles to the center base line, passing through this center point to the wall at both the outside and inside quarter. Without reference to the peculiar shape of the hoof, the last described line will intersect the centers of both quarters. In order to illustrate this description by a diagram, not fanciful, as too often mislead in works on farriery, but from nature, the writer had brought up from the pasture a mare four years old, of high breeding, whose feet had never been tampered with by either rasp or knife. The near fore foot was placed upon a sheet of white pasteboard paper and the tracing was made that is now reproduced in this diagram. At the center of the base line B E, noted by the letter



Digitized by Google

D, the line O P was drawn at right angles to B E, and the two points O and P evidently intersect the greatest fullness or centers of the quarters. Instead of the foot not being symmetrical, how beautifully its exact proportions at corresponding points are thus mathematically demonstrated by actual measurements! With these two "exact spots" thus accurately determined, take the measurements from the ground surface to the coronet at both quarters, keeping the compass in the same relative position, and you have the exact height of the quarters. As this diagram is needed in illustration of other facts its insertion in this paper is justified.

The only difficulty that can remain in the way of the "intelligent smith" is to draw the line through the cleft of the frog from the middle of the frog to the extreme toe, and the second line at right angles through the center of said base line to the outside and inside quarters. Now, professor, you again ascend the tripod and show him how easily and accurately that can be done without the aid of either a civil engineer or of his theodolite.

While measurements of the foot are under consideration, and they are always as interesting as they are instructive, it may be worth the space to obtain the center of the quarters by another method equally simple. The extended cleft line of the frog to the wall, B E, invariably indicates the precise point or center of the toe on the ground surface of the hoof. Fix one point of the compass, in this point, and swing the other to the fullest or most prominent swell of the quarters of a normal hoof. After marking that point, swing the arm around to the same point on the opposite quarter, and you will have two points exactly equi-distant from the point of the toe. From these points take the altitude of the quarters with the dividers, and you will thus ascertain any variation in their respective heights.

Now, seriously, Mr. Professor, you must begin to realize what a guy you have made of yourself, professionally, by thus hastily rushing into print with the triumphantly intoned, yet exceedingly weak, enquiry, "Where is the center of the quarter?" When it is too late you must perceive that the center of the quarter was, technically, of no moment. What was requisite was to fix corresponding points on both sides of the wall equidistant from the point of the toe, so that the relative height of the wall, at these corresponding points, might be definitely ascertained, with reference to making the wall perfectly level from heels to toe.

2. "But," continues the professor, "note the next point. Every horseman, "veterinarian, or blacksmith, is well aware "that in nearly all feet the inside quarter "descends from the coronet at a different "angle from the outer quarter; that is, "that the inner quarter more closely ap-"proaches the perpendicular than the "outer. This being the case any school-"boy knows that a fixed and equal meas-"urement for each (quarter intended) "must of necessity cause the inner side "of the foot to come in contact with the "ground first."

He says, "Nearly all feet." Why nearly all? Why should the inside quarter descend at the same angle from the coronet as the outside quarter, in some few feet, and not in all. Why this variation?

Referring to school-boys, it is their peculiar mode of reasoning, as well as that of older solons, whose minds are circumscribed by the narrow context of a school book, to lay down premises without regard to experimental demonstration, and then to rush on to *a priori* conclusion with unrestrained ardor. Has the professor unwittingly made this mistake? In the normal foot is the inside quarter straighter than the outside branch of the hoof? Let us test this proposition by the daily practice of the smith. When the blacksmith has finished his shoes, if the arms are of the same length, he punches a check on the branch intended for the outside, simply because he could not from the shape distinguish the branch intended for the outside in contradistinction to the inside of the foot. How could he possibly make this mistake if the inside quarter of even the slightly distorted foot of the domesticated horse, much less the full, rounded hoof of the unshod colt, that has never been tampered with by knife or rasp in the hands of ignorance personified, as dense as it is

Google

energetic, is palpably straighter than the outside quarter?

The Burdan and other companies have so far perfected their works as to make machine shoes almost as perfect as are now the exclusively used machine horse-shoe nails. They are made in all sizes, *but never "rights" and "lefts."* Without heating, or altering, they will fit normal feet of corresponding sizes, to a nicety. Could this be possible if the inside quarter of the hoof was straighter than the outside quarter? Passing from the test of mechanics to that of physiology, the wings of the coffin bone measure precisely alike, the inner wing extending just as far toward the wall as the outer wing. The quarters of the wall swell outwardly to permit the wings of the coffin bone to ascend and descend, in the articulation of the foot, without interference with or infringement upon the wings, by the wall at the quarters. Could this beautiful arrangement for the working of the internal structure of the foot possibly take place if the inner quarter more closely approached the perpendicular than the outer?

The wings of the coffin bone, when the hoof is pared to a level, ride up and down between the wall and the bars, with true precision and exact balance. When the weight of the footfall comes upon the heels and quarters they expand outwardly, and laterally. Could they expand alike if one heel is bent in and the quarter on that side is more perpendicular, while the other heel and the other quarter incline outwardly? If they could not expand alike in extent, could the coffin bone, thus tilted out of position, ascend and descend, at every footfall, with a level bearing and with exact precision? If thus tilted and strained by the enormous weight upon the bottom of the foot of the average horse, which has been calculated by the eminent French hippopathologist, Mons. Bonley, to be equal to one thousand pounds to the square inch, could the coffin bone withstand the strain without fracture, or the sensitive laminæ at the outer branch bear the greater tension thus imposed upon it without tearing asunder? The inside quarter is frequently straightened and made narrower by the criminally ignorant smith, with the design to prevent ankle-cuffing and knee-banging; but, by thus disturbing the perfect balance, and proportions of the hoof, he renders the evil he seeks to remedy all the more aggravated. Permitting the outside branch of the hoof to grow higher, and thus to bear an undue preponderance of the weight, may, by this partial disuse, somewhat straighten the inside quarter, allowing the toes to grow too long, while the less rapidly growing quarter, either on the outside or inside branch of the foot; if nailed far back toward the heel, will also narrow and straighten that quarter thus confined. But these imperfections are never found in the perfect foot of the unshod horse, roaming at large upon upland pastures. Taking the center line of the cleft of the frog, as the base line of test measurements, the outer and inner branches of such feet measure the same width at corresponding points when tried by the infallible arms of the compass. Thus the distance in the diagram from O to D, and from D to P is precisely the same, and the heels are exactly alike in measurement from the center line B, D, E.

To prove this, beyond a peradventure, extend the center line of the cleft of the frog to the outer wall at the toe, then pare down the wall on both branches till both heels measure from the point of the toe exactly the same distance. Now take the heights of both heels by the dividers, as hereinbefore fully explained, and they will invariably be found, in the normal hoof, to be exactly the same. This will prove to a certainty that the inclination of the quarters is the same, in degree, and that the heels also observe the same angle of obliquity. Thus every possible method of measurement will show the natural foot is not misshapen, but symmetrical at corresponding parts. The professor believes that atrophy alone renders the front feet different in size. One foot may be larger than the other, and generally is, although neither foot has been ensmalled by atrophy, nor enlarged by hypertrophy. The excess of pressure makes the difference in development. Very rarely does the horse, either in fast or slow trotting, strike the front feet with equal force upon the ground.

Digitized by Google

If you listen to the rhythm of the trotting footfalls upon the course, or, what becomes a more audible sounding board, upon the asphalt boulevards of the large cities, you can plainly detect that one front foot strikes harder than the other. With some horses it is the off, and with others the near front foot. But one result is absolute. Whichever hoof thus strikes the ground with the more force, is invariably larger than the other. Atrophy, the convenient diagnosis of the veterinary surgeon, like heart failure to the human physician, has no agency in this difference of size. It is the enlargment dependent upon greater use, just as the strong right arm of the smith that constantly wields the hammer is more developed than the left arm which merely acts as helper by grasping the tongs that hold the iron while it is being forged into a horse shoe.

Finally, the professor concludes that "the horse's foot is not a symmetrical block of wood," nor is "the structure of the limbs exactly correct from a theoretical mechanical standpoint."

Passing over the reckless use of terms, for there can be nothing theoretical about demonstrated mechanics, Nature has made no mistake in her animal mechanisms; for in every branch of physical construction she has furnished in the bodies and extremities of living forms, the absolutely faultless models of the perfect adaptation of means to ends. But the professor would have us believe that when Sunol made her marvelous mile in 2:08¼ without a perceptible variation in her trotting stroke, from start to finish, and when Salvator, by his prodigious leaps through the air, ran a mile in 1:35½, both feats were performed upon unsymmetrical feet and crooked limbs. However perfect may have been the carcasses, the extremities, though working in harmonious precision, and answering all the exact requirements of the complicated mechanism when forced up to its greatest momentum, were, nevertheless, so defective that "the limbs were not structurally correct from a mechanical standpoint, nor were the feet balanced, but the hoofs were plainly club-footed at the inside quarters and heels. Human ingenuity can not thus secure perfect motion upon mechanical appliances correspondently imperfect. The simplest of all contrivances, as for instance, the ordinary mowing machine, comes to a disastrous stop if the arm that carries the knives is approximately as much bent as are the extremities of the professor's horse; and the operating extremity of the mowing machine, for aptness of illustration, may be justly compared to the extremities of the horse.

Some stupendous error, either real or fanciful, has thus been made about the limbs and feet of the horse. Is it real—the fault of the infinite Creator, whose intelligence formulates and operates the vast machinery of the universe with that undeviating precision of accuracy which alone attends perfection; or is it fanciful—merely the gross misconception of that finite creature involved in the personality of the professor of the veterinary department in the Agricultural College of Mississippi? Mr. George Fleming, member of Council of the Royal College of Veterinary Surgeons of London, and the premium essayist of England on Practical Horseshoeing, would decide it was the latter; for instead of straight inside quarters, and heels descending at different angles as claimed by our reviewer, that eminent authority, on page twenty-nine of his Prize Essay Edition of D. Appleton & Co., New York, 1873, says: "The lower or ground face of the front hoof should be nearly circular in outline," and instead of "the limb not being structurally correct," on page forty-one he contends that the strain comes perpendicularly "from the shoulder to the fetlock, but "thence to the ground it passes along "the pastern and foot, which form the "extremity of the lever."

If the weight thus descends perpendicularly through the axes of the bones of the leg to the ankle, and then is deflected through the axes of the pasterns and hoof to the ground, it follows, as a physiological necessity that the leg must be structurally correct, for the slightest deviation would prevent this perpendicular transmission of the strain, and defeat the true mechanical action in locomotion.

Possibly the Agricultural College of Mississippi urgently needs a new demonstrator of anatomy in its veterinary department.

IN FASHION'S GUISE.

BY HENGIST.

INSOMUCH as we are treated in the public press to periodical paroxysms of indignation over the evidences of certain "barbarous" practices perpetrated by the decree of fashion on man's most useful animal companion, the subject on which this article deals may prove acceptable to our readers. Treated historically and descriptively, the omnivorous reader may add to his horse-lore, at the same time glorying, as an American, in becoming conscious how nobly his countrymen have avoided the many dubious and disreputable practices reviewed.

The following scrap appeared in the London *Live Stock Journal* not long ago. The description seems to be quite appropriate, as an introduction to our subject: "In the year 1549 one Andrew Needham lost a horse. He heard that it had been seen in the Earl of Shrewsbury's park. To that nobleman's agent he made this plea: 'In the latter end of this last summer, about six or eight weeks past, my wife lent a black curtail nagge to one Alice Fletcher to Worksworth in the Peak. From this the nagge strayed westward, and was taken as a waif [stray] at Belper or near thereabout, and was seen on a ground of my lord of Shrewsbury. I beseech you, good Mr. Williamson, to do me the favour you can for the recovery of my curtail. He is an old jade, and as false as he is old: his ears and tail cutt, his nose slit, his mane shorne, a little white of one of his fore feet, two saddle spots on the far side, somewhat dalebackt, and hath a bare spot on one of his buttocks as if he was scalded. He hath been stifled of both of his hind legs, and is white-spotted in both his hams with gartering. When he was lent he was not fully recovered of a stifling of his near hind-leg, and was sore in the ham with gartering. He racks and trotts: and if the country had been champaign [open] he would have come home. I pray you, good sir, to let this bearer have your letter in my behalf to my lord's officer in Belper.'" One would imagine there would be little difficulty in identifying such a well-described curtail, whose *value* seemed to have concerned his owner so much. He would surely have made a splendid diagramatical model.

Antique, Oriental and Obsolete Fashions.—Slitting the Nostrils.—In Hungary, Transylvania and Croatia the custom did and may yet prevail of slitting the narrow nostrils of the horses under the idea of giving their wind an easier passage and of preventing their neighing in secret expeditions. These horses have always been reported to carry the mark in their mouths as long as they lived, a quality, perhaps, peculiar to individuals of other countries. It is termed by the French *begut.*

Lockwood Kipling, in his "Mammals of India," recently published, informs us that this practice yet exists in the East among asses: "It may not be very painful, but the slitting of the asses' nostrils, almost universal in India, and meant to soften the clangor of the voice, has always seemed a monstrous affectation of delicacy of ear on the part of people who delight in the tom-tom and the pipe, while it gives a tattered and woe-begone air to the countenance, already sufficiently marked with dejection. When they slit the nostrils they proceed, in mere wantonness of brutality, to split the ears also." *Query:* Why don't some one originate a breed of brayless donkeys, as the duke of Newcastle, by judicious mating with the more silent individuals of the clumber spaniels, got rid of the objectionable baffing of that favorite breed?

Cropping the Ears.—Xenophon asserted that a mare would not readily admit the embraces of the ass until she has first been degraded by being "curtailed" of those graceful ornaments, her ears. Hence this brutality flourished. It was common even down to Lawrence's time. Cropping deprived the internal ear of its natural defense, and was, "nine times out of ten, practiced by those whose heads were empty, and who, it is pity, do not take the fit of making conjurors of themselves, sparing the ears of their unfortunate beasts." But "the argument of interest, so closely associated with our nat-

ures, had to have place," and in the case of huge, bangling, pendulous ears, the owner of a horse was tempted to "curtail" and reduce their volume, and "to remedy nature's blunder" by setting them erect. "I think," says Lawrence, "the suffering is by no means so great if the operation be performed during the colthood of the animal, but, after all, I am perfectly content to give up the practice, which is more than I can say with regard to docking, although I have never had the pleasure of riding a long-tailed horse in the fly season or through dirty roads in winter."

The "bangle-ear," would seem to have been a once common variety. According to the Century Dictionary it was a usual name for a horse with a dangling ear like that of the spaniel's or the zebu's.

Cropping the ears was practiced in Waterton's (elsewhere quoted) time also, in connection with which he remarks: "This superlative act of cruelty and bad taste drew down upon us a pleasant and sarcastic remark from our Gallic neighbors, which is here translated:

What folly in those Englishmen appears!
They cock their horses' tails, and clip their ears."

Tying the ears also seems to have been practised.

Nicking the Tail.—There may be in the above Gallic couplet some allusion to the *nicking* of horses' tails—now also forgotten. It seems impossible to discover the origin of nicking. The operation is most barbarous, painful and lingering; the use none, the appearance hideous, detracting from the beauty of the nag, particularly if she shows any breeding. There is a case on record of a horse-dealer who in performing the operation, "had his puddings kicked out of him by a well-directed stroke of the tortured animal's heels."

Old works on horse management give full directions for performing this barbarity. It was practiced early in the century. The process was to sever the tendons of the tail that kept the organ in its accustomed position. This was done by *nicking*, or cutting notches on the bare, inferior or under surface of the tail at different points—the tail, usually, having been already shortened. Thus a double cruelty was perpetrated. To insure that the tendons would not unite again by healing contact, a method was resorted to as depicted on plates of old horse books. After the nicks had been made, the end of the tail was tied to a cord, this was run over a pulley, over the horses' dock, fixed to the roof above; this cord was carried over another pulley and hanging from that was a heavy weight. Thus the tail was elevated so that the wounds had to heal over without the severed portions having any possible chance to unite. That this was practiced, there is no doubt. It is fortunately a thing of the past. Its object was to produce a "curtail" with a short, "graceful" upward curve, from which hung the remaining bush of the tail in a shape somewhat like a quarter of a Maltese cross. The practice has been "successful" in the treatment of the tails of certain dogs whose appearance was offensive to the professional eye of the unscrupulous of such particular fancy.

Plugging the Tail.—Another most absurd custom in regard to the tail is that seen in what was called the plug tails of the old Suffolk punches, which was retained for a time, indeed among newer breeds. The tail was left only two or three inches long, and the spigot end, about an inch was clipped clear of hair. Whether "a fanciful martinet" in Queen Anne's reign, Lord Cadogan, who plugged all the heavy dragoon horses, did it out of his own head, or derived the custom from his elders, or from his contemporaries, the Suffolk farmers, or whether the latter derived the practice from his lordship, has never been made clear by "curtail antiquarians." That lord, however, thus obtained "one of the ends of setting a fashion," by the French adopting his name to all curtails by whom a horse of that sort was afterward known as *un Cadogan*. In the subsequent reign the "natural right of tails" was re-established in the cavalry.

The tracing of a connection—if there is any—between a *plug-tail* and a "worn-out horse," the description which appears in the latest dictionaries under the word *plug*, is outside the limits of this paper.

Branding. — Cast troop horses, worn out and no longer fit for service, were, on

their dismission, branded on the jaw with a figure of a circle or wheel. It was also a custom for private owners of horses to burn into the flesh certain figures or marks, as letters of the alphabet, denoting their breed and country, or to whom they belonged; or to stamp them with the figure of a centaur, or the head of a bull.

Complaints against these cruelties were as common in former times as now. There was even a canon of the church published against them. In this they were termed "relics of paganism," as may be seen in Collier's "Ecclesiastical History."

"*Trimming*," *Ancient and Modern.—Treatment of Mane and Tail, Hirsuteness of Face and Heels.*—In trimming and dressing their horses certain of the ancient nations were very expert, adjusting their manes in all the various modes in present use. The mane was always turned upon the right side, a custom invariable since. Generally the mane, being cut close on the left, was combed smooth and flowing on the right side. In some, however, perhaps carriage horses, the manes were shorn smooth, others had the manes *hogged*, to use the modern phrase, that is, standing erect in an arched form, which again was occasionally cut into notches resembling the battlements of a town. The Armenians and Parthians had the custom of trimming their horses doubled-maned, by cutting the hair away in the center, which occasioned it to divide and fall down, clothing each side of the neck. This was a fashion not long since in use with coach horses upon the continent of Europe. The manes were also plaited as at present, and sometimes decorated gaily with ribbons. The tails were left long and nicely combed.

Saddle-horses of all descriptions, and those used in quick draft were, in the early part of the century, trimmed in the following manner: The legs and heels were trimmed quite close and delicately smooth and even, with the comb and scissors. The long hairs around the eyes were pulled; those below, upon the nose and lips, cut close with the scissors. The hair under the chin and in the ears was singed off with a lighted candle. The mane was pulled with the fingers, a few hairs at a time, until thin enough to hang lightly and smoothly on the off side of the horse's neck, to somewhat more than a finger's length. At the upper extremity of the neck the mane was shorn close with the scissors to the extent of two or three fingers' breadth, in order to admit the headstall of the bridle, and this left, detached from the mane, the foretop. This lock, cut close in the front at the roots with the scissors, and at the extremity, with the knife, was left about the thickness and length of the mane. Horses, more particularly galloways and ponies, were also sometimes hogged, or "their manes cut so as to stand erect like the bristles of a hog." The hair of the tail was cut short and even. The broom tail of the racer was somewhat longer than that of the common saddle-horse, and the hair cut off square at the end.

Military and draft horses wore their full manes and tails flowing. With the capital sorts of the latter, and indeed with cart-horses generally, it was the practice to leave the hair upon the legs and heels. One will readily agree to the uniformity in appearance of this with the full mane and tail. The full and whole suit of hair was considered to set off the majestic cart-horse, which, besides, had thorough attention paid to the cleanliness of his legs. Lawrence remarks on this: "But the hair upon a horse's legs undubitably encourages and harbors dirt, and the difficulty of dislodging it from beneath the mass of hair is one of the great causes of grease. The legs of all ordinary and wagon horses should be kept close-trimmed like those of coach-horses."

Singeing the hair under the chin and within the ears was a villainous practice also in vogue. The hairs might remain within the ears, being clipped even and somewhat below the level of the margins, "without the smallest breach of symmetry or offense to the sight." This hair, intended by nature as a defense to the inner surfaces of the outer portion of the organ of hearing, against cold and wet and the intrusions of insects, dust or any particles of matter which might be afloat in the air, by being removed farther "ren-

Digitized by Google

dered the animal liable to deafness." Besides, the horse soon learned to dread the lighted candle, which made the animal frequently dangerous.

Modern Practices.—Mane Pulling.—We shall now deal with fashions that concern the modern horse improver.

"Only dealers understand pulling the mane." The mane is parted in the middle, and the longer hairs, not more than two or three at a time, are taken in the fingers of the left hand; then, with the fingers of the right, or sometimes by means of a wide-toothed comb, the shorter hairs not held in the left are combed or run toward the neck; the long hairs are followed up with the fingers of the right, and with a quick jerk plucked out. It is cruel to pull much at one time, a little each day is enough. At length the mane will have been so thinned out that the locks fall thinly from the crest, giving that "appearance of style from breeding" so much desired which a heavy, thick mane can not do.

The "infernal machine" called a mane-puller should be prohibited. At the best the horse suffers torture enough. Let one pull a few hairs out of his head or face and he will have some idea of the twinge that a horse undergoing the same must feel. Thinning the mane by cutting is tom-fool's work. The mown portions soon shoot up through the uncut, resulting in an appearance of *chevaux de frise* that is as impossible to prevent as it is hideous to regard.

Blaine was the inventor of a mane-pulling machine which made a deal of money for the maker of it, who was so conscienceless as to demand payment from the inventor for manufacturing the original. In his directions for pulling the mane with the fingers, commenting on the difficulty of holding the hair in the fingers, Blaine recommends *well waxing* the fingers to insure a firm grip of the sliding hairs.

Hogging the Mane.—The custom of hogging was practiced by the ancients, as proved by their representations on their wonderful monuments, exactly as when introduced into England early in the century, when a "classical mania" struck the fashion. This rendered it necessary that even the equines should appear as they did in the Olympian games of old.

Hogging may be regarded as a sort of pompadour treatment of the mane—the glory of the horse that "clothed his neck with thunder." It is "appropriate" only to a certain class of ponies. The custom has been lately introduced among the polo ponies. It is not a mutilation. It is hurtless, just as that of making the broom-tail is. Where the mane is thin and irregular, trimming it in this way (if we can't agree to say that it "improves the look," at least we can in saying that the operation) hides the raggedness.

For ponies and all under fourteen hands, Fisher believes hogging is a "decided improvement." But he asserts that a mane hogged after the Parthenon (Greek) fashion is not "smart." It should be cut an equal "length" all the way, on which there will be no "roach" appearance, but simply a natural fringe to the crest.

The Egyptian, Persian and Grecian monuments and sculptures represent horses universally hogged. So do the figures of the horse incised on the antlers of deer found in the caves of early man in Western Europe. So was, and is, in nature, the wild horse of the old world. Thus it would appear as if the modern hog-mane was an heirloom reminiscence of the horse of prehistoric times. As that horse, we know also, was of small stature, and as hogging has always been confined to small horses, the suggestion receives additional force.

Clipping and Singeing.—Clipping the body of the horse was introduced into Britain in 1825 by the army officers, who became acquainted with the practice during the Peninsular war. Clipping and singeing previous to this were only practiced partially on the horse, it will have been noticed. When the practice of removing the hair from the body became fashionable, there was a new use found for the scissors and comb. The scissors was in handling a slow and laborious implement. Hence some genius invented a singeing lamp. This was also subsequently superseded by the clipping machine, which has since had such developments in America for barbers, and in Australia for sheep-shearers.

Digitized by Google

Arthur T. Fisher, late of the Twenty-first Hussars, in his "Through the Stable and Saddle Room," a book well worth studying, says: "In the old days horses were clipped with a pair of scissors or shaved. Of late years the clipping machine has rendered these old-fashioned practices obsolete. The horse's coat should never be clipped until it is properly set. This is known by the appearance of long hairs, known as 'cat hairs.' When they show these the coat may fairly be assumed to be ready for clipping. If a horse is clipped too soon he will never have the same appearance as if the proper time had been waited for, and it will be a source of trouble all the winter through."

He approves most highly of singeing. It should be performed in autumn directly the coat begins to show any signs of thickening, and it should be continued, constantly, through winter. He says it is the best and only way of keeping a winter coat thoroughly down. For the purpose he prefers a naphtha lamp, and advises the groom to always keep a damp cloth in his hand, which will prove most useful.

For saddle horses the region occupied by the saddle should be left unclipped and unsinged. The saddle, being placed on the back, the portion so covered should be marked off, as a guide to the clipper.

After clipping or singeing, a good sweating, thorough grooming and careful attention are absolutely necessary.

There has been, over this practice, as great an outcry as over shoeing. This well-meant indignation forgets, in connection with clipping as with shoeing, that the horse is not living out his natural existence, in which he had no roof to shelter his body. Mayhew has pointed out "the dangers of clipping." He says the animal so treated is liable to have its internal organs attacked. Perspiration "is thrown back" on the system by exposure, leading to cold and congestion. That is no doubt true where the necessary precautions are not taken to prevent that happening. When such does once happen, that is no reason for abolishing the practice. It does not prove it generally, improper practice. It is simply an instance of "culpable" negligence on the part of the groom.

That clipping is, under the highly artificial environment in which the horse is now found, a humanity, practical horsemen have no doubt. If there is artificial environment, there must be "unnatural" treatment. There is always such environment when we find the horse has been invited to step up into the plane of the higher requirements of civilization. Where he is not so used, but is treated as a breeder's mould and model, natural environment, as much of it as possible, is the aim, where only natural service or conduct is required of the animal.

Clipping, done so that the denuded surface becomes seasoned, is like a cold bath in the morning to a man, acts on the skin in the nature of a tonic—supposing the animal to be in vigorous health. Whereas a close-haired surface, on a horse which is given active work, is more or less in a relaxed state, inviting the entrance of cold, induced by the evaporation of its own sweat. Proper care will prevent colds in a clipped, actively-engaged horse, just as proper care in the stable will prevent grease or mud fever in animals that fashion has decreed should be hairy legged.

The total amount of hair clipped from a horse, when collected, is astonishingly small. It is so distributed, however, that it makes a wonderfully "thick" cover, necessary to the animal when "roughing it," but detrimental when in domestic use. We have hairless breeds of dogs and even an occasional "hairless horse" in nature that are no less hardy on account of the disappearance of hair from their bodies.

Prof. Wallace, of Edinburgh University, remarks of farm horses: "To make cleaning more easily performed and to add to the animal's comfort, the hair from the under part of the body and legs above the knee and hocks may be with advantage removed by clipping. The extremities of farm horses, which require protection to a greater degree, should be left with their natural covering. Horses thrive best when thus relieved of the surplus coat of hair. It is no uncommon sight to see an unclipped horse which had got warm in the yoke still

Digitized by Google

wet the following morning. This is an unhealthy and unnatural state of matters."

Fisher, referring to "light-legged" horses, says the fashion of unclipped legs was introduced from Ireland. It was supposed that leaving them unclipped was a protection against thorns, brushing, etc. But really it only concealed the results of these casualties. Hence it became better practice to clip the legs down to the hoofs. The hair was found to be no protection. It was none against mud fever, which could be more easily prevented in another way—thorough quick-drying, accomplished by enlightened stable practice. The fashion has, therefore, gone out in the shires, and unclipped legs are no longer seen in the field.

To the professional eye clipped legs on light horses and unclipped legs in heavy horses appeal to the idea of "balanced symmetry." Besides, to the stickler for "feather" in the draft horses, it would be as much an outrage to remove what Bill Nye calls the "whiskers" from the legs of the draft horse as it would now be to retain the lesser hirsuteness in the lighter-limbed kinds. Such is the result of association with ideas of certain standards of fancy.

If trimming must be done, as Blaine sensibly remarks: "Trim neatly or not at all. Our ideas of beauty are regulated by custom."

Docking the Tail.—Plutarch represents the custom of docking, then unknown in Italy, as being performed on the supposition that such mutilation would render them more swift, and their backbones more robust, a "notion" that prevailed till even a late date, the idea being that it had a similar result as the pruning of small trees apparently had. Paulus Venetius writes that the Tartars docked their horses "lest the animal should strike his rider, by having the power of whisking his tail from side to side."

Waterton, the naturalist, in his famous "Essays," describes the rage for docking that existed in England in his day: "I can well remember the time when this destructive mania for improving the anatomy of the horse by substraction had arisen to such a height of absurdity that both cart and carriage horses were so entirely bereft of tail, as to present an exhibition disgusting in the extreme. This docking pestilence (I allude to the custom of removing the whole of the tail) once raged throughout our island, and you would have thought that Dame Nature herself had taken smittle [infection], as we say in Yorkshire, for I knew a farmer's mare in the county of Durham, about the year 1794, that produced three foals successively without any tail at all." He tried to befriend the horse by allowing two fine colts the full quantity of tail which Nature had given them. He would not allow them to be deprived of "their rights." "People stared at me as I rode quietly along. * * * At last being obliged to ride to Leeds for mass on Sunday, the servants of the inn, in order to turn a penny by the hair, made free with the tail. They shortened it so much that it neither appeared one thing nor another, and at last I was reduced to the necessity of calling in the docker to free myself from future annoyance."

Lawrence, who was the author of "The Rights of Beasts," and a contemporary of Waterton, recommended the docking of foals while they sucked. He had taken off, with a sharp knife, a full hand's breadth of the tails of colts, from a month to three months old, the animals suffering so little from the stroke that it did not occasion them to quit their place or even leave off eating; nor were the wounds either bound up or dressed with any kind of application. He was induced to do it at such time by "observing some unsuccessful cases of docking full-grown horses, in which they suffered much from inflammation, extending to the rump, but chiefly by the motive of lessening generally the pain of a necessary operation."

"These fine tails," he says, "might be put into buckle *a la militaire*, yet the prejudice of custom will not suffer me to look upon such a fashion, for the turf, road or field, without a smile. And as the pain of the operation may be reduced to a fleabite, or that of a bleeding stroke, by performing it on very young subjects, I think little of it, reflecting with an aching heart upon the thousand times severer tortures which the ill-fated animal

Digitized by Google

must have to endure so incessantly, in his cruel and multiple labors, on which our commonplace philanthropists, confining their humane attentions on the tail, the ears, or some inconsequential circumstance relative to the animals, think nothing or to no manner of purpose."

So the practice persisted. Blaine (*Rural Sports*) says: "The tail also must be treated according to the fancy of the owner. The blood-tail is now left pretty much to nature, and is only squared when it is very full. If it is thinned, the hair must be pulled from each side. The squaring of the tail requires some dexterity to do it well, and to keep it in good order must be attended to frequently. The tail scissors must be long in the blades, and very sharp. When using them the tail is elevated by means of the hand, to the height it is to be carried. The cutting is begun in the middle, and the scissors turned round the circumferent edges."

Fisher remarks that cutting horses' tails is done to "give them a sporting look." It is a most difficult thing to cut a tail properly. Indeed we are impressed with the fact that the operation, as all others for the purpose of "improving" the look of the horse, is a work of art, and requires an artist to perform it. When the tail of the animal is seized the horse vigorously exerts himself to tuck it in close to the body for protection. If it were, under such circumstances, cut square, as might be supposed, when the animal was left to himself released from his fears, in his moment of ease, he would soon elevate his whisk, to discover something had happened to it, and then it would appear to the bungling operator to be a most ridiculous "shape." The cut that appeared parallel to the ground, now that the tail has assumed its natural elevation, or curve of relief, appears at an angle of about 45° from the level. It will thus be seen what artistic judgment and skill is required in the apparently simple squaring.

But, among the very tip-toppy, it is just this shortness combined with this veritable angular cut, with almost a suspicion of nicking that seems to be the "utterly *ultra*" appearance aimed at.

The term bang-tail ought really to apply a "broom-tail" in which the hair only, and not the dock, is cut square across, as in ladies' frontlets. Of course a horse's tail can't be docked without being banged. Hence docking necessitates banging, and so the phrase bang-tails has been applied to the whole fraternity of curtals.

The bang-tails therefore comprehend, the blood or broom-tail of the thoroughbred, and the docked, bobbed, stumped, cut, stubbed, and cur-tails of the hackney and hunter.

The draft-horse men have a way of doing up the tail to "show off" their horses, which indicates that artifice has to co-operate with nature for such purpose. Even women with their long hair have to do it up in various cockernonny ways. Americans, who stand by the long-tails find, in dirty weather, a buckle is an excellent contrivance, for the benefit of the horse's tail.

As to the cruelty of docking there will always be "an opinion." It depends a good deal on the time when it is performed. If it has to be done 'twere better done quickly, when the animal is young. Then it may be regarded of as little consequence as any of the other operations performed on animals for the benefit of man, or the race itself. As compared with dehorning, docking must be considered as a mere incident—at least it can only be half as cruel. In the young animal the parts are immature and quickly heal. Dehorning has been pronounced not cruel in the eye of the law, in America, Ireland and Scotland. In England, by a decision that has brought ridicule on the chief justice, who ruled on the mattar, the practice was declared illegal and "quite a sin." In the celebrated case that established the ruling in Scotland, a witness was brought forward to testify to the cruelty of dehorning. In the cross-examination it was elicited that this witness had practiced docking. Being thus neatly cornered he defended the latter practice. Pressed for an explanation of this seeming anomaly he declared that he did not consider docking hurtful: "Because it was performed *so far from the head!*"

Docking has also been claimed to be a "safety" measure; it prevented the

Digitized by Google

horse learning the habit of getting the reins below the tail, and hence, sometimes, kicking the carriage to pieces. Such and other advocacies of the practice it is unnecessary to combat. It was, on the other hand said to be at times followed by lockjaw—a contingency liable in any malpractice in surgery, or accident in cutting or abrasion where the nerve has been hurt.

Fisher remarks that "docking after a certain age is cruel. I fear it is cruel at any age. It should never be performed except by a skilled veterinarian, and then only on very young animals."

Docking, however, is at last going out of fashion even in the British army, in fact, it is now forbidden. The edict is that "Horses with short docks are not to be purchased as re-mounts." But it is still prevalent in many horse-breeding quarters, so much so that the Royal Commission on Horse Breeding in Britain, at its last meeting, having their attention called to the disadvantages resulting from the growing practice of docking foals in the great horse-breeding counties of England, desired to draw the attention of breeders to the fact that the future value of horses so treated would thus be seriously depreciated. The British cavalry regiments have learned a lesson as to the disadvantages of short-tailed horses in their campaigns in hot countries during the fly season. For horses to be used where flies are found full tails are, of course, the horses' only protection. In cities where the fly pest is more under control the curtail will continue to "bob up serenely." With the bang-tail aristocracy, docking will always be a mark of mutual admiration.

Means for Producing "Desirable" Gaits, High Stepping and Attitude.—In the account of disbursements for King Edward's wardrobe, there is an item for trammels, or those implements with which horses were taught to amble or pace. The word is supposed to be derived from the Italian *tramenare*, to shake or wriggle, of such sort being the motion of the horse in pacing. The trammels were made of yarn or strong list, and with those the horse's fore legs were tied together, and he, being forced forward in this state, acquired in time that "short wriggling and oblique mode of progression called ambling." Trammels were also made of iron-like fetters; these, in course were fabricated by the *ferrarii*, the ferrers or shoers with iron. They also shod the hinder feet with long and sometimes sharp points, projecting from the toe, which co-operated in the same intent with the trammels upon the fore legs. What ridiculous pains to harass and torture and totally spoil the natural and excellent paces of the animal were taken in those days.

But the infliction on the horse of uneasy methods, for the purpose of training him into proper attitudinizing are still with us.

High stepping has been facetiously regarded as having been acquired by the horse being compelled to traverse hot iron plates, or logs of timber, or soft fallows, or deep layers of straw. These, however, not being supposed to have been sufficient, we read of some who have been gravely informed that the habit was acquired by the horse being made to waltz over wheelbarrows. But all these methods have been improved on by the fellow who actually places spectacles over his horse's eyes so as to magnify the difficulties of his path. Spectacles have also been actually used on horses on the home stretch for another purpose.

Kipling, whose interesting book we have already quoted from, has some relevant remarks: "It is true that even in England, which is, relatively speaking, the true horse paradise, carriage horses are still made to learn certain artificial tricks, relics of unwise old fashions, indefensible because interferences with nature. To teach the outstretched flying buttress attitude, which is considered good form, the animal is set to stand, and the inside of the fore legs is tapped with a whip till he covers the proper extent of ground. The French take more pains to exaggerate this position than the English. But during the season in the park you may often see an English coachman, on pulling up, fidget with reins and whip till his animals are outstretched like wooden rocking-horses. This is considered quite beautiful, but it is the worst possible attitude for a horse

to move forward from, since it may cause strain in back and loins. But it is only done when the animal is at work. In India the poor brute is tied tightly in this posture and left for many hours together without possibility of relief.

"The neck of the horse, a wonderful piece of construction, plays an important part in all his movements. It is one of the first parts to show fatigue, seeing, that like a pendulum, it balances every movement. The gait of an animal with a crippled neck becomes mincing and constrained. But it is precisely this rickety, rocking, all-of-a-piece action that most pleases the Oriental, since it is supposed to resemble the dainty stepping and wanton prancing in which young horses indulge at times. A sort of high-stepping caper is taught the *chabuk sowar* (whip-rider) or breaker, holding, in addition to the bridle, cords tied to the fetlocks, with which he gives a jerk, crying, 'Ho!' This brings the foot up with a flourish, and, one would think, should occasionally bring the horse on his nose."

Nature's Bearing-rein and Man's.—If one examines the neck in the skeleton of a horse he will find that the cervical vertebræ form a remarkable natural curve. It is below this curve that the vessels and bronchial tubes are found. An appreciation of the manner in which the cervical region is filled up with muscles ought to convince all of the cruelty of adding a tight artificial bearing-rein to the one already naturally provided. These neck muscles have received the curious name of *pax-wax*, which we may explain. The first part of the word has reference to *hair*, a variety of which was *fax*, yet seen in such words as Fairfax and Halifax. The second part of the word has no reference to any variety of the article of that name, but contains the meaning of *growing*, as seen in the old expression, to *wax* strong. Hence the combined word means to grow, or growing hair, which the neck does in the mane.

The name has come to signify the neck muscles. The pax-wax is, therefore, nature's bearing-rein. Though we do not say that an artificial bearing-rein is unnecessary, no doubt, in some instances, it does become a serious cruelty.

The bit and curb, in the carriage horse, being connected with the bearing rein, is held taut by the saddle, which again is hitched on by the crupper to the tail. The attachments being all "strung" tightly, the animal labors under a good deal of strain, to relieve which he has to throw his head and tail up and to stretch his limbs into that "buttress" attitude that is so satisfying to the style-exacting eye. Different kinds of bearing reins produce different degrees of torture and attitude.

The fashion-plate horse, about all etched in, imagination must here supply him with his glittering harness. See him stand in classic pose, but modern unrest, in buttressed attitudinizing position. A super-arching neck: a drawn-back head, so that the facial outline is perpendicular instead of angular; a wiggling bob behind, a fit subject for the artist's pencil or sculptor's chisel. With flashing accoutrements and accompaniments, champing bit, chucking foam about, "pawing" the gravel, he and his companion in distress stand as if they were born to be, in rest or in motion, impelled by but a single thought, to produce uniformity only in their every attitude or movement, presenting a perfect picture of high-bred spirit and mettle.

The pair have been "at attention," but now there is a premonitory champing of bits, a merry jingle of pole-chains, a rhythmic tread of hoofs, a subdued trundle of wheels, and the stately equine-drawn equipage moves and gradually glides gracefully, the cynosure of admirers' eyes, out of sight. But in fashion's world the horse is not, after all, singular in the peculiar guise he has often to appear and suffer in. It is a horse's misfortune to be born in the equine purple patronized by the *elite*.

The Freedom of the "American-born" Horse from all This.—There is a bang-tail aristocracy in America, but that we are told is un-American. Wherever "fashion" rules we may be sure to see its belongings, animate and inanimate, dominated by rules demanding its subjects to appear just in such a style peculiar to its own ideas of cult. Outside of this exclusive, formal set is the greater American public. By that the horse is treated as "a free-born citizen." The

American trotter, the greatest product of the breeders' art, not only of America, but of the age, and upon the perfection of which the country's eminence in the breeder's art must ever rest, stands out among equines untouched by fashion's fancy fads. American horses have the "rights of their tails" reserved to them. Yet, if ever shortening the tails would be a convenience, it should be in the American trotter. See where "the right" has to be stowed, in a race. In this free country the "rights of the horse," though apparently uninterfered with, are actually being continually *sat upon*.

TROTTING IN FRANCE.

IN connection with the particulars published in the article on the Orloff in last MONTHLY the writer thinks the following details as to trotting in France may be of passing interest. A few American breeders may be aware of the fact that trotting is quite an institution in that fair country. The particulars referred to are extracted from Mr. Gibson Richardson's book entitled "The Corn and Cattle Producing Districts of France." *Inter alia* are some additional facts as to the famous Orloffs, and some particulars as to the trotting performances of Percheron horses. In conclusion we present a record of "best times" of foreign trotting, which we presume is the first collected list of the kind:

"There is a club at Caen for the encouragement of half-bred horses, under whose auspices trotting races are held in Normandy. Through their example the taste for them is spreading over France. In 1874 there were eighty-four trotting-race meetings in various parts of France against sixty-two in 1872, and 220 races against 176, while the acceptances were 1,537 as against 1,298. Of the 220 races 195 were ridden and 25 ran in harness. The usual distance, at the best meetings, is 4,000 metres, the old league of 2½ miles. The club weights for riders are 9 stone 10 pounds for three-year-olds, 11 stone for four-year olds, and 11 stone 11 pounds for five-year-olds and upward. In some races the minimum height is limited to 14 hands 2 inches, and the maximum time usually allowed for horses to be placed is ten minutes. The weight of the carriage, when this race is run in harness, is generally 220 pounds for three-year-olds, 275 pounds for four-year-olds, 330 pounds for five-year-olds, 385 pounds for six-year-olds and upward, including the driver. But for Percheron horses it is 330 pounds for four-year-olds, 385 pounds for five-year-olds, and 440 pounds for six-year-olds and upward.

"Out of the 1,537 acceptances in 1874, 656 horses were placed and there were 337 takers of prizes. In almost every race more than one prize is given, sometimes as many as seven. Out of the 220 races 129 were for the distance of 2½ miles, and they produced 133 takers of 259 prizes. The most speedy did the 2½ miles in 6:58, the slowest in 10:24; the average of the whole 259 was under 8:10, only 8 being above 10 minutes. This makes a pace at the rate of 18 miles 3 furlongs an hour for 2½ miles—a high average to be attained by 133 horses winning 259 times. The average of the 82 fastest horses was 7:45, or 19⅓ miles per hour; of these 82, 4 of the fastest were by Heir of Linne, the others were removed one degree from English blood. These four ran in 32 races, one of them, Orphée, winning 12 times, making an average of 7:06 and beating all the others. Twice he covered the distance in 6:58, twice in 7 minutes, once in 7:04, and three times in 7:07. He reduced his average by the other four races which he won so easily that he was not put to his full speed, but he was evidently the best horse of his year. In one race he did 3¾ miles in 10:17.

"The year 1876 shows considerable increase in these races. The number of meetings has risen to 106, and the races to 373, 55 being in harness and 318 in the saddle. The entries were 2,226. Of these 830 horses were placed, and there were 485 takers of prizes. There were 104 races for two and one-half, and they produced 129 winners of 212 prizes. The average time of these 212 was 8:10, but the 129 horses did their best races

Digitized by Google

in an average time of 8:03½. Only 4 were over 10 minutes.

"The best pace was by a Russian horse, Galka, in 6:45. The next best was by Triton, by Flying Cloud, in 6:45. The average of 35 horses for the two and one-half miles was 7:24, and for 50, 7:41. Triton ran 18 times, was 10 times first and 8 times second. Of the 485 winners 58 were by English sires, 15 by Arab, 3 by Russian, and 409 by French; these latter, however, being mainly of direct English strains.

"In 1873 Niger, by the Norfolk Phenomenon, trotted the two and a half miles once in 6:57 and once in 6:55. Protecteur, by Bayard, did the distance in 6:53. But the fastest record of a French horse is that of M. Revel's Pactole, who trotted two and one-half miles in 6:38.

"On December 28, 1875, Zethus, a white horse, was matched at Toulouse to do twelve and one-half miles in 40 minutes, trotting under saddle. He did the distance in 37:21. The same horse was backed for £200 to do the same distance at Caen in 38 minutes. He did it in 37:19, to the surprise of Norman breeders. Zethus is by an Arab sire out of a mare of English descent, a daughter or granddaughter of Fitz Gladiator, but not thoroughbred. This horse was twelve years old at the time, a big horse and he showed no signs of distress at the end of the race. In the spring of 1877 Zethus was beaten in a trotting match at Tolouse by Baron Finot's thoroughbred mare, Zacinthe, by Fortunio, out of Siren. The distance was eighteen and three-quarter miles, on the ordinary road; the mare won easily in 59 minutes. Zethus was much distressed, but no doubt the fourteen years told against him.

"At the trotting races held at Vienna during the exhibition of 1873, a Russian mare, seven years old, covered two and three-quarter miles in 6:56, against eighteen competitors, of which six were placed —two Russian, two Italian, and two French, the longest time being 7:17. At the same place there was a trotting race for pairs, the carriages to have four wheels and seats for four people, but with no stipulation as to the weight. The distance was five and one-half miles. Twelve pairs of horses competed, of which four were placed. The winners were Italians, and did the distance in 17:18; Prussians of the Orloff breed were second, at 17:34; Italians third, at 17:53, and Russians fourth, at 18:16.

"During the winter's races of 1875–76 in Russia, Young Bedouin did two miles in 4:59 in a four-wheeled drosky; which it is calculated, makes the horse lose ten seconds, as compared with a two-wheeled sulky. The mile in the drosky would be 2:29½, and deducting the ten seconds it is reduced to 2:19½, or two miles in 4:39. America does not show much better work than this. Goldsmith Maid has made a mile in 2:14; three others in 2:16; the fastest record for two miles is 4:50½, and for three miles 7:21.

"The longest trotting races in France are those held at Neubourg, in Normandy. They are run in harness and upon the ordinary high road. The distance is eight miles one furlong. Eight horses ran in two races in 1874. The fastest time was 24:52, won by Bon Espoir, and the slowest of the six placed was 30:25.

"In 1872 a trotting derby was established at Rouen, the first race to come off in 1874 for horses born in 1871. The entries for the first year were thirty-four, of which eighteen declared forfeit, one seems to have died, four did not come to the post, and eleven started. The race was, as usual, two and one-half miles. The race was gone in 7:42 by the winner, which is a good pace for a three-year-old, as trotting depends so much on training. By six years of age a horse ought to gain a minute of time.

"There were thirty-five entries for 1875; forty-eight for 1876, and seventy-four for 1877, a very notable increase. The winner in 1876 was M. Leba's Rebus, by Pretty Boy, out of Miss Ariel, time, 7:35. The names of the sires or grandsires of the horses entered show their English origin: Heir of Linne, Phenomenon, Matchless, Pledge, Young Quicksilver, Eclipse, Morning Star, Pretty Boy, Flying Dutchman, Sincerity, Sultan, Norfolk Phenomenon, Fireaway, Affidavit, Catspaw, Performer, Chief Baron, Fling, Sting, Stag, Young Shales and Flying Cloud."

In the same work we have some in-

Reproduction.

EDITOR OF THE MONTHLY:

NATURE in all her departments is very lavish in her provisions for reproduction, and no less so in the animal kingdom than in the vegetable.

I am now nearing seventy years of age and have had over forty years of experience as a breeder. Most of this time I have had from one to three stallions doing duty in the stud. In early manhood I concluded that sex must be controlled by a natural law, and if this law could be discovered it would be of great value to humanity as well as to breeders of animals. I was not long in getting at the key to the whole matter. I found that early service and late service gave male offspring. But when I came to investigate the hermaphrodite and ridgling type of animal, such as are met with occasionally, I found them to be the product of a partially changed egg which had become changed through the influence of heat, moisture and time, or in other words, it had taken on a natural growth toward the higher form of development, but was fertilized during this transition, hence the product, perfectly natural in accord with the law regulating sex.

Now in order to make this plain to the reader, I wish him to follow me through a period of heat with some animal, a mare for instance. Suppose that she has come in heat during the last twenty-four hours and is given service. If conception follows said service the product will always be female, but if service is deferred until after the egg has commenced to change you may get either a barren female, or hermaphrodite, or ridgling of some type, depending upon the degree of development at the time of fertilization. But if service is given after the change is completed and conception follows, you get a male, and the nearer the end of the period (which lasts about eight days) that conception takes place the stronger and better he will serve in the stud, hence, the safest rule to adopt in breeding animals is to breed as near the ends of the period as you can. It is only in this way that you can be sure of producing the best possible male or female for breeding purposes. Such mares are sure and regular breeders, and no man ever saw a weak stallion that was produced by breeding at the extreme end, or nearly so, of the period. This is why we find such a difference in the capacity of stallions in the stud. This change takes place in the egg or eggs while in the womb of animals if not fertilized until the last of the period; the ovaries become the testicles of the perfect male, which is the highest type of development at that stage to be reached in the animal kingdom.

What is conception? It is the vitalizing of the egg, changing it to the living germ or embryo. What has been furnished by the male to make it so? It is nothing less than the nervous system. The living principle has been introduced and accepted by the mother. This law was and is for the purpose of perpetuating the various species of animals in the domain of nature. If animals, undomesticated as they are in nature, roaming over the earth, are early served, then males are plenty—no need of more. Just now the progeny will be female, but if males are scarce they may go to the last of the period before service is met with. In such cases the progeny will be male, because males are scarce and more are needed, hence we see that the law is self-regulating and the wisdom of it is apparent, since it provides a way to preserve and perpetuate the various species of animals on the earth.

I hope I have made this matter plain to my brother breeders, and I hope they may test the law as I have for years, but always be sure of the time when the period of heat commences in your ani-

mals. You can then be sure to not produce the undesirable hermaphrodite or ridgling type of animal by breeding during the transition of the egg, at about the middle of the period, but you may, and can, with the knowledge of the law, produce either sex at will, in perfection, by breeding your animals as near the extreme ends of the period of heat as you can. In conclusion I wish to say to my brother breeders that if after testing this law, which I claim to have discovered, and know something of its value to the world, you have any overflow of heart, you can present me with a free service fee to some of your best-bred stallions, and if they are within my reach I shall be apt to make your acquaintance at some future time, should life be spared me, and I will say here that I have strong hopes of seeing one hundred years, as it is my ambition to see a two-minute trotter, but the pacer will get there first.

I am truly a friend to the well-bred horse and all who are engaged in improving and developing him.

HENRY FLOYD.

Eureka, Wis.

How Breeds are Made.

EDITOR OF THE MONTHLY:

THE origin of the Russian Orloff trotter, says the French *Revue de Haras*, sprung from the introduction of the silver gray Arab stallion, Smetanka, at a cost of 60,000 roubles ($4,500), by Count Orloff Tchesmensky, in 1775, and he was bred to a Danish mare of large weight, the offspring gave good form but lacked the trotting action. Count Orloff then crossed one of the colts, Polkan, with a Holland mare, which produced the celebrated Bars 1st, that gave renown to the race.

Smetanka transmitted to Bars his pure blood, his force and density of muscles and spirit; the Danish mare gave him weight, length and solidity of his limbs. The Holland blood, the free movement of the shoulders and elegant action. Thanks to the ingenious idea of Count Orloff the happy reunion of the three races in Bars 1st gave to Russia her race of trotters that have acquired the reputation justly merited and taken the name of the Russian Orloff trotters.

Later on Count Orloff decided to introduce a dose of pure English blood into their veins through the mares. During the life of Count Orloff the stallions were never sold, but since 1845 the director-general of the government has sold annually the surplus stallions and mares not required in the government stables.

In 1865 the purity of the trotting breed was discussed, whether the trotting speed was regularly transmitted, or the particular aptitude of an exceptional animal. It was decided, however, by a majority, that a stud book of the pure-bred trotters was desirable, justified by the fact that the race has been established and maintained as a race pure for more than fifty years.

They decided to admit only animals having four sires and four dams of pure blood, without a mixture of other races. To distinguish these pure-bred horses they are recorded in the government stud book as R. P. (race pure).

The horses are trained at two years, and begin to trot at three to five years. The distances vary from 1½ verstes (one English mile) to 7½ verstes (five miles); 1:41 to 1:52 per verste, or about three minutes to the mile, which is not equal to the speed of our American trotter, but his breeding is better established and produces the characteristics of the breed with remarkable regularity.

Thus we see the merits of pure breeding in the uniform reproduction, and we also see the long time it takes to establish a breed.

We saw a number of these pure-bred Orloff trotters at the international Concour at Brussels in 1888; beautiful horses, with long, flowing mane, and heavy tail that swept the ground. Mr. J. Heyl, Milwaukee, Wis., has imported some Russian stallions, also some pure-bred Arabian and Trakemen stallions to cross upon American trotting mares. The result will be watched with much interest, as the selection of these stallions, at such great expense, as an experiment to develop, if possible, by the infusion of these pure-bred stallions, speed and endurance, with model conformation and beauty of action.

T. BUTTERWORTH.

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, MAY, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00
All in one order..... 35.00

What Are "Trotting-Bred" Mares?

A GENTLEMAN who writes for a down East paper finds a good deal of fault in regard to an article printed in the last number of the MONTHLY, which had reference to the ten fastest trotters by Electioneer from each of four different classes of mares, namely: Trotting-bred, half thoroughbred, thoroughbred and pacing. In another part of this issue of the MONTHLY will be found some remarks by Mr. Joseph Cairn Simpson on the same subject, which moved the eastern writer to an elaborate essay. Mr. Simpson hangs his criticism on the slender thread afforded by the use of the words "pacing mares" instead of "pacing-bred mares," and as shown by a foot note to what he has written his controversial point is not altogether well taken. The eastern writer pays a very complimentary, and, we trust, deserved, reference to the article in the last issue of this publication by saying that it "is very interesting, and the tables therein presented very instructive, bringing together as they do the names and records of the fastest horses sired by the great Electioneer, from what the writer calls 'thoroughbred mares,' 'half-thoroughbred mares,' 'pacing mares' and 'trotting-bred mares,' and showing by these tables that the socalled trotting-bred mares lead all the rest, both in average speed and at an earlier age. Such tables set men to thinking and are productive of great good, for the more deeply men examine into the subject, and the more they apply thought in practice, the greater will be the results attained."

It appears, however, that the eastern writer doesn't agree with the MONTHLY in regard to the class of mares which may be properly referred to as trotting bred, his contention being that in order to be distinguished by this appellation mares should be standard by breeding, and not made standard by the performance of their produce. Therefore, he argues that in compiling comparative tables it is unjust to include therein as from trotting-bred mares any horse whose dam is not standard by breeding under rule 7 or 8. Having erected this ingenious and certainly convenient guillotine of his own invention, the work of decapitation which follows is naturally not a difficult one, and the writer immediately proceeds to throw out from the list of horses given in the MONTHLY articles as from trotting-bred mares the following:

Lot Slocum, 2:17½, dam by Mohawk Chief, son of Rysdyk's Hambletonian.

Arion, 2:10¾, dam by the trotter Nutwood, 2:18¾, out of the trotter Addie, by Hambletonian Chief.

Adair, 2:17¼, dam by Culver's Black Hawk.

Campbell's Electioneer, 2:17¾, dam by Clark Chief, out of a mare by Carr's Edwin Forrest.

Norval, 2:17½, dam by Alexander's Norman, out of a mare by Sir Wallace.

Del Mar, 2:20, dam Sontag Dixie, by Toronto Sontag.

It will probably be a surprise to the owners of these well-known trotters to learn that their dams are not trotting bred, and especially will people who have studied the blood lines of the phenomenal two-year-old trotter, Arion receive a shock, because, if there was ever a trotting-bred mare, in the proper sense of the words, the dam of Arion is entitled to that distinction. In the first place she is by the trotting-bred trotter Nutwood, 2:18¾. In the second place she is sister to a pair of trotters whose records are 2:16½ and 2:21 respectively: In the third place her dam was a trotter, mak-

Digitized by Google

ing a record of 2:39 twenty years ago, and in the fourth place the sire of her dam was a son of Rysdyk's Hambletonian. It is not infrequently the case that a horse may be intensely trotting bred and still not come within the technical provisions of the standard, and the facts in the case of the dam of Arion are sufficient to show how fallacious and misleading must be statements based on the idea as to what constitutes a trotting-bred mare, put forward by the Boston critic. It is hardly necessary to go any further in attacking a position so inherently untenable, and yet it is by virtue of this ingeniously prepared pitfall of sophistry that it is possible to dispose of six prominent trotters by Electioneer who were classed by the MONTHLY as being from trotting-bred dams, among them the sensational performer Arion. Having done away with these six notable performers the critic figures out that the ten fastest trotters by Electioneer and out of trotting-bred mares stand third to ten each from half thoroughbred and non-standard dams, it being, as above stated, his idea that a mare can not possibly be non-standard by breeding and trotting-bred at the same time. Such a position however, demonstrates with greater force than could almost any other presentation of facts, the weakness of its author.

Another point in the MONTHLY article to which the eastern man takes exception is calling Beautiful Bells an intensely trotting-bred mare. The facts are few and simple. To begin with, Beautiful Bells is trotting-bred under the standard rules. Secondly she has a record better than 2:30. She is by The Moor, a horse that was trotter enough to make a record of 2:37 something like twenty years ago, and that in turn was by the trotter Clay Pilot and out of Belle of Wabash, a mare who, although her blood lines were unknown, was famous as a trotter. The dam of Beautiful Bells is Minnehaha, and Mr. L. J. Rose, who as the breeder of Sultan, Stamboul and many other trotters, may reasonably be called a good judge in such matters, has put himself on record as saying that she had trotting speed far above the common. The sire of Minnehaha was Stevens' Bald Chief, and he was a trotter. Minnehaha is known from one end of the country to the other as a great broodmare, having produced five with records better than 2:30, in addition to which her son Alcazar had four in the 2:30 list at the close of 1890, and her daughters had produced ten 2:30 or better trotters, two of them being two-year-olds, one a yearling, while two others have beaten 2:20 at three years of age. Still it seems that one man does not think Beautiful Bells is intensely trotting-bred.

It is the mission of the MONTHLY to disseminate information relating to trotting horses and at times to draw from the records of each trotting season such conclusions as seem to be warranted by the facts. It was in this spirit that the article in reference to the ten fastest trotters by Electioneer out of different classes of mares was prepared, and that it was of interest and value is amply attested by the fact that it has been reproduced by nearly every turf journal of consequence in the country. There is an honest difference of opinion among breeders as to the value of close strains of thoroughbred blood in trotting pedigrees, and it is not straining the facts in the case to assert that the trend of sentiment on this point is largely in favor of what may fairly be called trotting-bred trotters. It is true that Electioneer, whom the records show to be the greatest of trotting sires from some points of view, and certainly by far the greatest in the production of colt trotters and of 2:30 speed in the aggregate, has been successful in siring extreme trotting speed from strictly thoroughbred mares, Palo Alto, 2:08¾, being the most conspicious instance, and in fact the only Electioneer trotter with a record better than 2:20 from a thoroughbred mare. From a half-thoroughbred mare came Sunol, 2:08¼. These facts were not only not slurred over or ignored in the MONTHLY article, but they were referred to and emphasized. Arion was given as an instance of what Electioneer could do in siring speed from trotting-bred mares, because it was believed, and is still believed by the editor of the MONTHLY, that under any fair standard of reasoning Manette is a trotting-bred mare. What the breeders of the American trotting horse want is unprejudiced, uncolored and unbiased information, and that is exactly what the MONTHLY tries to give them. If any man believes that near crosses of the blood of the thoroughbred are valuable in a trotting pedigree he can cite Palo Alto, Sunol, Ansel, Whips, Azmoor and others of the get of Electioneer in support of his views. It is only fair, however, to reiterate the statement that although Electioneer achieved a pronounced success when mated with thoroughbred mares, he was a horse that in respect of controlling action and producing standard trotting speed had no equal, and until some other horse has

Digitized by Google

done what he accomplished when bred to thoroughbred mares, it will not do to bank too heavily upon that fact. More than one man has died of pneumonia through putting on a linen coat as soon as the first swallow arrived.

Laying up Heats.

THE rule in regard to laying up heats in trotting races which was adopted by the Congress of the National Trotting Association a couple of months ago, has caused more vigorous comment among drivers and trainers of trotting horses than any enactment of a legislative sort which applies to the trotting turf. It seems incredible that a rule so stringent in its workings as that which provides that a driver may lay up only one heat in a race, and that he must announce his intention of doing so to the judges, obtain their consent to such action, and then have their decision announced from the stand, could be passed by a legislative body which included among its membership men who have made the rules in the trotting turf and stud.

There is no more law-abiding man in the trotting-horse business, no man who drives his horses more fairly or gives the judges less trouble than Budd Doble, and yet Mr. Doble, the dean of American reinsmen, was the first man to protest emphatically against this rule, which he did in an interview with the editor of the MONTHLY, stating without any equivocation that he would not trot horses unless it was waived. Mr. Doble's reasons, given at length in a recent issue of the MONTHLY, for the stand he took in regard to the new rule, were sensible and cogent ones. He pointed out how utterly impossible it would be for a driver to decide definitely beforehand whether or not it would be advisable for him to lay up any particular heat, saying that in place of being able to do this with any certainty, it was frequently the case that a man changed his mind two or three times as to whether or not he would drive for a heat after the word had been given, his judgment on that point being guided by the varying phases of the race in which he was engaged. Mr. Doble showed plainly enough that after a man had under the new rule notified the judges that he intended to lay up a heat, circumstances might arise which would render it almost impossible for him to lose the heat unless he pulled his horse, and so patent is this and other points which the new rule attaches that it seems impossible to have it generally enforced.

Wishing to learn what other drivers of prominence had to say regarding this matter, they were addressed on the subject by the editor of the MONTHLY. Orrin Hickok, who has by his work in the sulky during the last third of a century fairly earned the title, "The Tallyrand of the Trotting Turf," writes from San Francisco, under date of April 6, as follows:

"You wish my opinion about the rule relative to laying up one heat in the race. I think it all wrong, for I have seen many races lost by drivers making a mistake and then driving for the heat. I think the way to benefit racing is to do away with the French pools; that is where the trouble lies more than any other cause. Asking permission of the judges to lay up a heat is all right. I have done that for the past ten years, where I intended to lay up from the start, but after making a break and getting interferred with in some way, I think the driver should have a chance to save his horse for the next heat. This is my candid opinion."

Peter V. Johnston is a man in whom the race-going public has the greatest confidence. In a letter to the editor of the MONTHLY he says: "I am opposed to laying up heats and think every horse should go for every heat. What will the judges do if all the horses should want to lay up the same heat? They could not very well refuse to allow me to lay up after giving some other driver permission. If they did they would be aiding some one in the race. Make everyone go every heat, that makes all equal."

Gil Curry writes from Tennessee: "I think the rule a very poor one and that it will cause a great deal of trouble for both judges and drivers. It seems to me it will be impossible to make it work. I will race under National rules only when I am obliged to, which I trust will not be often, and hope the National Board will see its mistake and make a change in time to prevent trouble."

The best exposition of the matter that has come to hand is the following from T. J. Dunbar, a man whose skill and integrity are unquestioned. Says Mr. Dunbar writing from Milwaukee, Wis., under date of April 11:

"Referring to the rule adopted by the Naional Trotting Association at their fourteenth Congress, which is intended to prevent drivers from laying up but one heat in a race, and that one only by permission of the judges and then by them announced from the stand, it is certainly, to say the least, a very queer rule and

Digitized by Google

one which must lead to confusion and unnecessary trouble.

"It will tend to make racing more dependent upon luck than skill, increase the duties of the judges' stand, and work hardship for the owner and drivers. How will the judges determine which driver out of five or ten starters is entitled to the privilege of laying up a particular heat? Will it be fixed by drawing cuts, or will each driver be allowed fifteen minutes to argue his case? In case of only two starters and one of them wishes to lay up a heat, it will be rather a tame performance to the audience after the announcement has been made. It is very often the case that there are five or six horses that start in a race, but really only two contestants for first money, the balance being clearly outclassed. With two heats each and all four closely contested, it would in many cases be exceedingly cruel to drive for the deciding heat with an animal suffering from exhaustion; but to lay up the horse without consent would subject the driver to fine or expulsion, and to get consent and have it announced from the stand would destroy all interest in the race to the audience, and besides that lose a chance to win on account of the fact that the other horse was in like condition and would go out satisfied to get second money and go a slow heat. Is this rule made to protect the pool box, and, if not, where does its protective work come in? Will some of the gentlemen that voted for such a rule explain how it is possible for a driver to determine just what heat he can afford to have announced that he will lay up until he has scored up and got the word "go," and the work is laid out before him with all its varied and different phases which do not present themselves until the start is effected, and even then circumstances will change his mind in the home stretch?

"If the driver is working in the interest of the pool box, it is quite an easy matter to lay up a heat, as then he would not win under any circumstances, judges or no judges. But if he is driving to win he will accept any opening to do so at any stage of the game, but would hardly want to go ahead and win if it had been announced from the stand that he would lay up that heat. A fine state of affairs to have it announced that Mr. Leavitt has begged leave to not win the coming heat and his request has been allowed according to rule; and it follows, of course, if he should win it, even though the other horses should fall down, all bets are declared off.

"Drivers as a rule are men of honor, and in every business transaction, as well as in driving races, some part must be left to the judgment of the man who is empowered to transact it. To compel a driver to divulge his plan of attack or name his line of defense, which with him is as yet partially unknown and is bound to be until the skirmish commences, will rob racing of its keenest pleasures and reduce it to the level of a flip of the copper to see who gets the money. Weave around the judges' stand all the red tape you like; order in more wine; invite more visitors up to help pass away the time; shout loud and long '$25 fine for scoring up ahead of the pole horse,' post the new rule submitted by H. P. Whitehead in conspicuous places, so that the judges will be sure, even if they get full, that they will not be assassinated on their way home; do all this, and then the owners and drivers will make horse trotting popular and entertaining if you will agree to strike out this rule, which interferes with the fundamental principles of racing. Gentlemen, the rule will not work. Please keep off the band wagon."

Here are expressions of opinion from some of the best known drivers in the country, and the MONTHLY presents them simply because they are news and not from any feeling one way or the other in the matter.

MR. E. MCHENRY, the records show, was one of the most successful drivers in the country, last season his list of winning races being a long and creditable one. McHenry is in every way a competent and artistic reinsman, and his finishes are electric. Here is what he says of the rule, writing from Geneseo, Ill., under date of April 22.

"I will give you my opinion about the rule passed by the National Association at its congress last February, to the effect that a driver can lay up but one heat in a race, and that in order to do so he must first get permission of the judges to do so. I, for one, am very much opposed to that rule. It is the most senseless rule, in my judgment, that I ever heard of. If enforced, it will be injurious to every first-class driver on the turf. Just think of a driver being compelled to drive a horse as hard and fast as he can go when there is no show in the world to win the heat! That is just what the new rule requires.

"All the successful race drivers I ever saw are governed by circumstances in regard to laying up heats. I have started to win a heat several times and something would turn up

Digitized by Google

during the fore part of the mile which showed me that it would be to my best interest to lay up. I have many times won a heat that I intended to lay up when the word was given. A successful race driver must be governed by circumstances during each and every heat, for many times various things happen in a heat to make a man change his mind.

"There is not one single point that I can call to mind in favor of that rule. The rule was made, no doubt, to protect people who bet their money on heats. That being the case, would it not have been far better to have abolished heat betting and left the rule as it was? Have owners, drivers and horses got to be punished to protect a few gamblers and touts who follow the trotters from spring to fall and bet their money on heats? If the National Association sees fit to adopt rules to protect that class of customers in preference to owners and drivers, I, for one, am ready to stay away from tracks that are members of that Association. I object to trotting under rules that deprive me of the opportunity of using my best judgment in driving a horse to win a race.

"There may be some drivers who lay up heats on purpose to bet their money on the heat. I never did, and I think the drivers are scarce who do. I for one am not willing to believe that all drivers are dishonest and that all judges are honest. I believe there has been as much fraud committed in the judges' stand as there has ever been in the sulky seat, and it would have been far more wise to have made a rule protecting owners and drivers against dishonest and incompetent judges, than it was to make a rule that forces a driver to make both himself and his horse look like a sucker by driving for heats that he has no chance in the world to win, and thereby ruining all chances of winning the race."

The Dam of Rysdyk's Hambletonian.

JOHN MINCHIN, who is one of the old school of New York horsemen, has been giving to the world, through the medium of an eastern paper, many interesting facts and reminiscences concerning animals long since dead, but whose blood has proved of great potency in the production of trotting speed. Considering what has been accomplished by her son Rysdyk's Hambletonian and his descendants, it is probable that less is known of the history and personal characteristics of the Charles Kent Mare, dam of Hambletonian, than any other animal of like influence in the history of breeding, and it is also a matter on which those interested in the light-harness horse and his blood lines should congratulate themselves that Mr. Minchin has recorded historical facts in a clear and concise manner.

That Hambletonian was much the greatest progenitor of trotting speed the world has ever seen is unquestioned, and his blood through his descendants is at present so dominant in the breeding of the American trotter that without it practically nothing would have been accomplished. Almost without exception the best performers at all ages and distances among the trotters are descended on one side or the other from Hambletonian, and even among the pacers it is found that the Hambletonian blood has blended kindly with other strains in producing some of the most noteworthy exponents of the side-wheel gait, two conspicuous instances of this character being found in Fausta, the champion yearling pacer, record 2:22¾, and Direct, the champion pacer of the world, that has a record of 2:06, the fastest race record in the world, and the fastest three consecutive heats in a race against other horses. Fausta is by Sidney, who is descended directly in the male line from Hambletonian through Santa Claus and Strathmore, while Direct has the same blood in the male line through his sire, Director, and his grandsire, Dictator. The yearling trotting record is held by Frou Frou, a daughter of Sidney, and she therefore runs back to Hambletonian without any intervening crosses of other blood. In fact, the four trotters that as yearlings have made records better than 2:30 —Frou Frou, Bell Bird, Athadon and Freedom —trace in the male line direct to Hambletonian. The two-year-old record of 2:10¾ is held by Arion, a grandson in the male line of Hambletonian, and he also goes back to that horse on the dam's side of his pedigree, his mother being a daughter of Nutwood, who in turn was a great-grandson of Hambletonian. The three-year-old record, 2:10¾, belongs to Sunol, a granddaughter of Hambletonian, as do also the four and five-year-old records and the fastest trotting record in the world, 2:08¼, she succeeding as queen another granddaughter of Hambletonian—Maud S. Nancy Hanks, the third fastest trotting mare in the world, her record being 2:09, is likewise a granddaughter of Hambletonian, her sire being Happy Medium, and she is also inbred to Hambletonian, as Dictator, the sire of her dam, is a son of

Digitized by Google

Hambletonian. The champion stallion, Palo Alto, is a grandson of Hambletonian; the next fastest entire horse, Allerton, is a great grandson of Hambletonian, through Jay Bird and George Wilkes; the third fastest stallion, Nelson, is from a mare by Gideon, a son of Hambletonian, and the fourth, fifth and sixth fastest stallions, Arion, Stamboul and Delmarch, all trace directly to Hambletonian, Stamboul being out of a daughter of that horse, while Delmarch is by his grandson, Hambrino, and Arion by his son Electioneer.

To put this matter of the prepotency of Hambletonian blood in our fastest trotters in still more forcible shape, it may be said that at the close of 1891 fifty-one horses had made trotting records of 2:15 or better, and the list is herewith given in order to show those that are directly descended in the male line from Hambletonian. It is as follows:

Name.	*Record.*	*Sire.*	*Relation of Sire to Hambl'tn.*
Sunol	2:08¼	Electioneer	Son
Maud S	2:08¾	Harold	Son
Palo Alto	2:08¾	Electioneer	Son
Nancy Hanks	2:09	Happy Medium	Son
Allerton	2:09¼	Jay Bird	G'dson
Jay-Eye-See	2:10	Dictator	Son
Nelson	2:10	Young Rolfe	—
Arion	2:10¾	Electioneer	Son
Guy	2:10¾	Kentucky Prince	—
Stamboul	2:11	Sultan	—
St. Julien	2:11¼	Volunteer	Son
Delmarch	2:11½	Hambrino	G'dson
Axtell	2:12	William L.	G'dson
Jack	2:12¼	Pilot Medium	G'dson
Egthorne	2:12½	Egbert	Son
McKinney	2:12½	Alcyone	G'dson
Margaret S.	2:12½	Director	G'dson
Belle Hamlin	2:12¾	Almont Jr	Gt. g'dson
Mary Marshall	2:12¾	Billy Wilkes	Gt. g'dson
Pat Downing	2:13	Abe Downing	—
Maxie Cobb	2:13¾	Happy Medium	Son
Rarus	2:12¾	Conklin's Abdallah	—
Robert Rysdyk	2:13¼	William Rysdyk	Son
Bonnie McGregor	2:13½	Robt. McGregor	Gt. g'son
Harry Wilkes	2:13½	George Wilkes	Son
Phallas	2:13¾	Dictator	Son
Vic H	2:13¾	Blackbird	—
Clingstone	2:14	Rysdyk	Son
Goldsmith Maid	2:14	Alexander's Abdal'h	Son
Trinket	2:14	Princeps	—
Homestake	2:14¼	Gibralter	—
Nelly W	2:14¼	Rolla Golddust	—
Patron	2:14¼	Pancoast	—
Alvin	2:14½	Orpheus	—
Bonnie Wilmore	2:14½	Wilmore	G'dson
Incas	2:14½	Inca	—
Rosaline Wilkes	2:14½	Conn's H'y Wilkes	G'dson
Faustino	2:14¾	Sidney	Gt. g'dson
Hopeful	2:14¾	Godfrey Patchen	—
Lockheart	2:14¾	Nutwood	Gt. g'dson
Pickpanla	2:14¾	Pickpocket	Gt. g'dson
Prince Wilkes	2:14¾	Red Wilkes	G'dson
Alabaster	2:15	Aberdeen	Son
Alcryon	2:15	Alcyone	G'dson
Arab	2:15	Arthurton	Son
Balkan	2:15	Mambrino Wilkes	G'dson
Charleston	2:15	Bourbon Wilkes	G'dson
Favonia	2:15	Wedgewood	Gt. g'dson
Lula	2:15	Alexander's Norman	—
Majolica	2:15	Startle	Son
Pennant	2:15	Abe Downing	—

We find therefore that of the fifty-one horses in the 2:15 list there are only fifteen that do not trace directly in the male line to Rysdyk's Hambletonian, and several of these fifteen have the blood of that horse through some other channel. Nelson, for instance, is out of a mare by a son of Hambletonian, and the same is true of Stamboul. Pat Downing's dam was by Mambrino Abdallah, a horse that traces in the female line to Hambletonian through Alexander's Abdallah. Trinket is out of a mare by Rysdyk's Hambletonian. Homestake's dam was by Volunteer, son of Hambletonian. The dam of Patron was by Cuyler, son of Hambletonian. Orpheus, the sire of Alvin, was by C. M. Clay Jr. or Almont, and if the last-named horse is his sire, he, of course, traces through him to Hambletonian. The dam of Pennant was by Harold, son of Hambletonian. Here then are seven of the fifteen horses in the 2:15 list that do not trace to Hambletonian in the male line, carrying a portion of that blood derived from other sources, and there is a possibility that another should be included in the list; but setting that instance aside we find that the 2:15 list of trotters, which comprises fifty-one names, contains only eight trotters that do not carry the blood of Hambletonian. Having thus demonstrated briefly, but conclusively, the overwhelming influence of Hambletonian blood when the standard is the highest that can be applied, it is somewhat startling to note the contention made by Mr. Minchin to the effect that Hambletonian derives his greatness and his power to propagate speed from his dam, the Charles Kent Mare, who was a daughter of Bellfounder, and not from Abdallah, his sire. On this point Mr. Minchin makes a good argument. After describing Abdallah as a sixteen-hand bay horse, with light mane and tail, cow-hocked and with poor hindquarters, the horse being chiefly remarkable for great will power, he says:

"Abdallah sired a great many colts, and many stallions by him were used all over the country. But he sired only one that had the power to transmit speed, and that was Hambletonian. And why? Simply because they were not out of Bellfounder mares. Bellfounder himself was a trotter, the Charles Kent mare was a trotter, and through her influence (and no other) we have the phenomenal time-beater of the world. Again, to prove more conclusively my claim for the superiority of the Bellfounder strain. Take a look at the well-known quitter in a race, Harry Clay, which was endowed with all the gifts of that truly despised family. He was by Cassius M. Clay Jr., out of a Bellfounder mare also. And here again we are met by the potent influence of blood on his dam's side. The prepotent power of Harry Clay to transmit speed, has beyond peradventure proved abortive in the paternal line, but in the maternal line his daughters have worn the golden diadem of the harem. They, crossed with any strain, have astonished the world. Now,

Digitized by Google

although Hambletonian and Harry Clay were both out of Bellfounder mares, yet Hambletonian's sons and daughters were endowed with the prepotency for speed, while there is quite a diversity in their transmittable abilities. Harry Clay could accomplish it only through his daughters. His sons threw back to the Clays. And, although Harry Clay, in a hippodrome with George M. Patchen, trotted a scratch mile in 2:29, he never could compare with his almost half-brother, Hambletonian, which never saw the day he could beat three minutes, yet, as I said about the Clay mares, they became the potent factors in the production of the great American trotter. Still another, the dam of Belmont, by Alexander's Abdallah, was out of a mare by Brown's Bellfounder, son of imp. Bellfounder, and Belmont produced not only trotters himself, but transmitted the ability to produce them also. Therefore, take it all in all—we are forced to the conclusion through his marked ability—it follows that through his dam, the Bellfounder or Charles Kent mare, Hambletonian obtained readily and held easily the foremost rank as a trotting sire in America."

We are well aware that Mr. Minchin is not the first man to call attention to the greatness of the Bellefounder strain, and the presumably powerful influence it exerted in making Hambletonian the progenitor of a great trotting family, but never before has the case been so ably presented. The facts as given afford food for reflection as well as opportunity for those who do not agree with Mr. Minchin to give their side of the case.

It Is Potent Blood.

THIRTEEN of the new 2:30 performers of 1891 were out of mares by Strathmore, a son of Rysdyk's Hambletonian that a considerable number of years ago came into prominence as the sire of that remarkably fast and game horse, Santa Claus, a stallion that in his day could trot right around any other entire horse in the country, and if anybody thinks this statement of the speed of Santa Claus is overdrawn let such person interview Peter V. Johnston, who drove Piedmont, 2:17¼, when that horse was in his prime, and he will testify that on one occasion Santa Claus took the pole away from Piedmont going down the back-stretch, and that Piedmont's time for the quarter was thirty-two and a half seconds.

When people realize that the record of 2:17½, which is to the credit of Santa Claus on the books, does not come anywhere near representing the speed possibilities of that horse had he been sound and fitted expressly for a fast mile, they are no longer apt to wonder why it is that from Santa Claus came Sidney, certainly the most sensational sire of speed both at the trot and pace, for his age, that the world has ever seen. But those who, so to speak, know the inside history of Santa Claus, who have knowledge that, cripple as he was in his latter days on the turf, he could even then have gone a mile close to 2:12, are not at all surprised at what the blood of Santa Claus has accomplished in producing Sidney, when it was mated with that of so positive a horse as Volunteer through his fleet daughter Sweetness, 2:21¼, to these strains of Hambletonian blood being added a third through Edward Everett, sire of the dam of Sweetness, and to crown the whole structure, an infusion of the Clay blood that has never failed to give trotting speed and action, albeit sometimes of a flashy sort. When Santa Claus entered Orrin Hickok's stable he was certainly on the down grade in point of physique, having very shaky legs indeed, but it was not long before Hickok recognized the stallion's greatness in that he had a phenomenal turn of speed and was game as a bulldog. It was about this time that Santa Claus, Piedmont, Wedgewood and some others were named to come together in a big stallion race at Boston. Piedmont had been winning all his races down the Grand Circuit line with the exception of a solitary defeat by Edwin Thorne, so that Hickok knew it would take no ordinary horse to down the chestnut son of Almont and Mag Ferguson over the Boston track. He decided to give Santa Claus a mile about as well as he could go, for Hickok, although long since past the stage in his experience where he overtries a horse, is still always willing to see a trotter or pacer go at least one cracking mile before he puts his money on him in a race. Hickok's only confidant previous to the Boston race was W. H. Crawford, and one day when the rest of the boys were at dinner, Santa Claus, having previously been jogged and warmed up in as unostentatious a manner as possible, was started on his journey. He went away at a good rate of speed, and after safely rounding the first turn, which was apt to be his critical point in a race, stepped down the back stretch so fast that Crawford, who was doing the timing, thought there must be some mistake about it. When Santa Claus flashed by the three-quarter mile pole, however, in 1:39, having gone that much of the journey at a 2:12 gait, Crawford became alarmed lest somebody else might be holding a watch, and knowing that Santa Claus was not a horse to stop in the home stretch, he signaled vigorously to Hickok to pull up, which was done. Crawford, who is a good

Digitized by Google

judge in such matters, and not apt to be very enthusiastic, doesn't attempt to say how great a mile Santa Claus could have accomplished that day had he been driven out after going three-quarters of a mile in 1:39, but there isn't much doubt in the minds of those who knew the horse best that the mark would have been 2:12 or better. At all events, what Crawford and Hickok saw of Santa Claus that day made them so firm in the belief that neither Piedmont nor any other stallion of the day could beat him, that they bet a lot of money on the Boston race and made about as big a winning as ever in their lives, the only heat that Piedmont won being on sufferance. Santa Claus, since his retirement from the turf, has been kept in practically, if not absolute, seclusion at John Turner's farm near Philadelphia, and his stud services have been as good as nothing.

It is remarkable that in view of what Sidney has accomplished in siring champion yearling trotters and pacers and more 2:30 and 2:20 speed at the trot and pace than any other horse of his age ever did, some breeder with an eye to the future has not bought Santa Claus. It is very true that the blood lines of Sidney might, in that event, be practically duplicated in some other animal and still no great results follow, but if the laws of heredity are to be regarded, and if the experience of the past in the breeding of the light-harness horse is to be taken as a criterion it stands to reason that not only would Santa Claus get a lot of speed in the first generation, but that his progeny would in turn reproduce that much sought-for quality. It is a significant fact that Strathmore, the sire of Santa Claus, is obtaining unusual prominence among the sons of Hambletonian as a brood-mare sire, and, inasmuch as in some respects Santa Claus, with limited opportunity and less age than Strathmore, has already outbred Strathmore very much in respect of a producing son, it is only natural to assume that were he given a chance the potency of his blood would continue to demonstrate itself. In these days the wave of public favor is all in the direction of horses which, in addition to being first-class performers, trace directly in the male line to Rysdyk's Hambletonian, and on the maternal side of the pedigree have a strong array of producing dams that are likewise of approved lineage.

Fast trotters with good pedigrees attached are being produced in such numbers nowadays that the time when an untried stallion which doesn't show speed is able to command much public patronage at a high fee has gone by. In cases like that, for instance of Lord Russell, brother to Maud S., a horse whose pedigree was ultra fashionable, but whose speed development was stopped by an unfortunate accident which wrenched one of his hind legs, it is indeed fortunate for such an animal if he be owned at a breeding establishment where it is possible for him to be given a high class of mares without applying to the public, and thus establish his reputation as a sire of speed in a manner that could not possibly under other circumstances be accomplished, simply because he would not have anything like as good mares bred to him. In spite of the sensational advancement in the way of siring extreme speed as well as standard speed at an early age that has been made of late years, there was never a time when the prospects of the small breeder were as good as right now, for the simple reason that multiplication of highly-bred animals means smaller prices at which they can be secured, and every season is showing with greater force the important fact that sensational trotters are commonly produced by small breeders. It is true that the capitalized value of phenomenally fast stallions has increased during the last three or four years in a wonderful degree, two such horses having been sold at the age, respectively, of two and three years, for more than $100,000 apiece. One of these was the product of a great breeder's enterprise, while the other was foaled the property of a man whose earthly possessions at that time probably did not amount to as much as $5,000. The cry that the zenith of prices for trotting-bred stock has been reached can find no foundation in the experience of the past and but little in the future to make it seem plausible. On the contrary everything points to a maintenance of the present firm market for the right sort of stock—that which performs and produces. A great deal has been said by people of a pessimistic turn of mind to the effect that standard horses are no better than any other kind unless they can do something in the way of trotting to prove it, but this is not altogether true, because while a horse may be bred in standard lines and still not show any great amount of speed it is nevertheless a fact that his possession of certain strains of blood makes him more valuable for any use to which he is put,

Digitized by Google

no matter if it be only to assist in drawing a street car or express wagon, because even in those walks of equine life a well-bred horse will accomplish more than a scrub. Were this not a universal law, there would indeed be little encouragement for the farmer and the small horse owner to breed up, but it is a truth universally recognized, and one in which every owner of a standard-bred animal can take solid comfort.

The Overhead Check.

THERE has been a good deal of nonsense written and talked about the use of the check rein. Much of this discussion has come at times from a consideration of what is known as the overhead check. Humane persons very properly make the point that in a majority of instances the use of this style of check on carriage and driving horses is not only needless but productive of discomfort and pain to the animals. This is a statement that will hardly be disputed by any intelligent man who has had to do with the ownership, management or care of horses. The most cruel abuse of the overhead check is to be found in the case of carriage horses used in large cities. Such teams are ordinarily driven and looked after by men who have not the slightest conception of how horses of that class should be handled. The "swellest" rigs in our large cities are ordinarily in charge of a coachman who is imported from England, a country where the overhead check is practically unknown, and if the coachman of the rich American be not an Englishman he is generally a Scandinavian, who previous to coming to this country never saw an overhead check, or for that matter an American road vehicle of any description. These men in their ignorance and with the idea that the appearance of a horse is improved by having his head yanked into an unnatural position by the use of an overhead check, carry the matter to such an extreme that if they had their deserts half of them would be in the police court for cruelty to animals. The unnaturally high checking of a horse in the first place causes the animal to stumble far more than he otherwise would, and while it may be pleasing to some people to have their team present a "toppy" appearance, they would hardly indulge in that pleasure did they know at what expense in the way of pain to the poor animals, it was obtained. Even among men who handle fast trotters the use of the overhead check is far too common in cases where that adjunct of the harness can not be of any possible value. The late James Goldsmith, a horseman by birth, education and experience, seldom used an overhead check on his trotters and pacers. Doble and others who are eminent as reinsmen prefer a side check except in the case of horses where the overdraw is a necessity. Each season sees fewer toe weights and overhead checks. It is an admitted fact in these days of progress in matters relating to the trotting horse that the highest rate of speed is obtained when the animal is going most naturally—in other words when toe weights, overhead checks, boots, etc., can be dispensed with. The "line trotter" is the fastest trotter and goes easiest to himself, consequently as a rule he does not need to have his head drawn up and held in that position by a check. Toe weights are going out of fashion, sweat hoods have been almost universally discarded, and overhead checks must join the procession.

Producers of Four or More.

IT is not so many years ago that the list of mares which had produced two or more trotters or pacers with records of 2:30 or better was an extremely brief one, but it has now grown to such proportions that, although to have become the dam of two in the 2:30 list, entitles a mare to the distinction of a place in the Great Broodmare list, the really high-class matrons of trotting history are those with four or more of their progeny thus distinguished, and as showing that a considerable number of mares have reached this point of extreme advancement in producing powers, it may be said that a list based on four or more 2:30 trotters or pacers produced by each mare contains no less than twenty-eight names, each of these mares having to her credit four or more trotters or pacers that are standard by performance with the minimum speed limit for pacers fixed at 2:25. The total number of standard trotters and pacers produced by these twenty-eight mares is 129, or an average of a trifle more than four and one-half each. A list of these mares, together with the names of their sires and the number of standard performers produced by each, is as follows:

NAME.	Sire.	No. in List.
Alma Mater	Mambrino Patchen	5
Beautiful Bells	The Moor	6
Belle of Clarence	Finch's St. Lawrence	4
Belle S.	Star of the West	4
Bicara	Harold	4
Black Flora	Black Prince	4
Dolly	Mambrino Chief	4

Digitized by Google

Name.	Sire.	No. in List.
Emeline	H. B. Patchen	7
Fanny Jackson	Stonewall Jackson	4
Flaxey	Kentucky Clay	4
Green Mountain Maid	Harry Clay	8
Gretchen	Gideon	4
Lady Sherman	Milliman's Bellfounder	4
Laura	Joe Hooker	4
Lucia	Jay Gould	5
Mabel L	Victor	4
Maid of Clay	Henry Clay	4
Minnehaha	Stevens' Bald Chief	5
Miss Russell	Pilot Jr	4
Ned	Berkley's Edwin Forrest	5
Rebecca	Gen. Benton	4
Reina Victoria	Rysdyk's Hambletonian	4
Rushville Maid	Blue Bull	4
Santa Claus	Magic	4
Sontag Dixie	Toronto Sontag	4
Sontag Mohawk	Mohawk Chief	7
Sue	Thorndale	4
Waterwitch	Pilot Jr	5

It will be noted that under this severe test as to great broodmares the strain of blood that in the male line has been productive of the greatest amount of trotting speed, that of Rysdyk's Hambletonian, is well represented, the head of the house and three of his sons, Harold, Gideon and Jay Gould, being included. Other representatives of the Hambletonian blood in this list are Thorndale and Mohawk Chief. The Mambrino chief family is present in the head of the house himself and Mambrino Patchen, his greatest son. Pilot Jr. appears twice, and Blue Bull is also represented by a daughter with four in the list. This refers, of course, to the direct male line descent, and in this particular it will be noted that Henry Clay is prominent in person and through a number of his descendants. The list is one full of information and food for reflection for breeders.

Annual Meeting of the Stockholders of the American Trotting Register Association.

Chicago, Ill., April 6, 1892.

The stockholders met at the Auditorium Hotel at 12 m., April 6, 1892, pursuant to call, as provided by the By-Laws.

Among those present were Judge Irving Halsey, H. C. McDowell, W. H. Wilson, Judge M. W. Oliver, S. G. Boyle, H. D. McKinney, W. J. White, E. A. Smith, F. S. Waters, A. J. Caton, Jackson I. Case, John W. Conley, Budd Doble, Ed A. Tipton, D. G. Brown, W. P. Ijams, F. J. Berry, Samuel Baker, J. W. Day, Morris J. Jones, J. H. Steiner, George Bronson, A. L. Thomas, L. A. Davies, George H. Ketchum, M. W. Bonfield, J. A. Murphy, H. C. Chamblin, W. Powell, William Russell Allen, J. C. Sibley, Lucas Brodhead, C. J. Hamlin, Norman J. Colman, W.C.France, S.A. Browne, W. A. Sanborn, C. F. Emery, C. W. Williams, Frank Rockefeller, W. D. Brown.

The meeting was called to order by W. R. Allen, president, in the chair, and a committee on credentials consisting of W. P. Ijams, F. S. Gorton and J. C. Sibley, appointed.

The Committee on Credentials reported 661 shares of stock duly represented.

The Chairman announced that the Auditing Committee, Messrs. Gorton, Ijams and Waters, appointed to examine the accounts of the Secretary, had found them correct and submitted the following report:

The assets of the Association on April 1, 1892:

Cash in hands of Treasurer	$13,350 92	
Due from Wallace Trotting Register Company	119 79	
		$ 13,470 71
Franchise		180,500 85
Unsold capital stock		57,300 00

PERSONAL PROPERTY.

Purchased by the American Trotting Register Association	$ 791 91	
Received from the Wallace Trotting Register Company	500 00	
Plant bought of C. D. Sibley	3,065 20	
Petty cash fund	100 00	
Amount due from Monthly on advertisements	3,521 31	
From Western News Company	307 34	
		8,285 76
Ledger accounts due from individuals		1,934 23
Merchandise as per attached report		3,651 03
Year Book, No. 7, on hand, 1,638, at $2		3,276 00
Register, Vol. X., all on hand		7,500 00
Year Book, No. 7, C. O. D.'s not yet returned		3,153 55
Total		$229,072 13

LIABILITIES.

Bills payable (To J. H. Wallace)	$ 35,000 00
Capital stock	150,000 00
Ledger accounts due to individuals	272 83
National Park Bank, overdraft	77 82
Year Book, Vol. VII, open accounts	6,000 00
Register, Vol. X, open accounts	3,434 40
Total	$194,785 05
Assets over liabilities	34,287 08

Upon motion the report was ordered received, approved and filed and the committee discharged.

The proposed amendments to the By-Laws, as submitted by the Executive Committee, were read, discussed, and the By-Laws as amended adopted, as follows:

The By-Laws of the American Trotting Register Association.

AS AMENDED AND ADOPTED AT THE ANNUAL MEETING OF THE STOCKHOLDERS APRIL 6, 1892.

ARTICLE I. Name.

This organization shall be called the "American Trotting Register Association."

ARTICLE II. Object.

This Association is formed to establish rules regulating the standards and to register trotting and pacing horses thereunder, and to advance the legitimate interests of the breeders of such horses.

Digitized by Google

ARTICLE III. GOVERNMENT.

SECTION 1. The government and management of the Association shall be vested in a Board of thirty Directors, who shall be stockholders. This Board shall be divided into three equal classes of ten each, at the annual meeting in 1892, the first class to be elected for one year, the second for two years, and the third for three years. At each subsequent annual meeting ten members shall be elected to serve for the term of three years, in place of those whose terms then expire.

SEC. 2. Not less than seven directors shall constitute a quorum for any and all purposes.

SEC. 3. Any vacancy that may occur in the Board of Directors, by reason of death, resignation or otherwise, may be filled by the remaining directors at any meeting.

SEC. 4. The regular annual meeting of the Board of Directors shall be held at the office of the Association on the first Wednesday in April, at such hour as the Board may appoint.

SEC. 5. The directors may call special meetings of the stockholders as often as they may deem expedient on giving not less than fifteen days' notice, by mailing to each stockholder a notice thereof, addressed to his last-known place of residence or business, to the best information had by the secretary.

SEC. 6. An Executive Committee shall annually be elected by the directors, which shall consist of seven directors, who shall hold office for one year, or until their successors are duly elected and qualified. All vacancies in such committee shall be filled by the directors at their next regular meeting thereafter, or at a special meeting called for that purpose.

SEC. 7. The President shall call special meetings of the directors whenever deemed proper by him, or whenever three directors shall request him in writing to do so, or on the written request of the owners of one-fifth of the capital stock of the Association. The call issued for such meetings shall specify the objects thereof, and shall be mailed to each director not less than fifteen days previous to such meeting.

SEC. 8. The directors shall appoint or authorize the President, with the consent of the Executive Committee, to appoint clerks and employes, and may require of them, as well as all officers of the Association, except the President and Vice-President, satisfactory bonds for the performance of their duties.

SEC. 9. At each annual meeting of the stockholders the directors shall submit a statement showing the condition of the property and financial affairs of the Association, and shall also issue such statement at any special meeting of the stockholders, when requested by them to do so.

SEC. 10. All elections by the directors shall be by ballot, and a vote of a majority of the whole number of directors present shall be necessary for a choice.

ARTICLE IV. OFFICERS.

SECTION 1. The officers of the Association shall be a President, Vice-President, Secretary, Treasurer and Registrar, and such other officers as may be from time to time designated by the Board of Directors. The President and Vice-President shall be chosen from the Board of Directors. All the officers of the Company shall be elected by the directors and hold office during the pleasure of the Board, except the President and Vice-President, who shall hold their respective offices for one year, and until their successors are elected and qualified.

SEC. 2. The Board of Directors shall meet for organization and regular business without unnecessary delay after each annual meeting of the stockholders.

ARTICLE V. DUTIES OF PRESIDENT.

SECTION 1. It shall be the duty of the President to sign all certificates and bonds issued, and to have the same countersigned by the Secretary, or such other officers as may be designated by the Board of Directors.

SEC. 2. The President shall preside at all meetings of the Association, and of the Directors and Executive Committee, and shall be the chief executive officer of the same.

SEC. 3. The Vice-President shall preside in the absence of the President, and act as President in the case of his death, resignation or refusal to serve.

ARTICLE VI. DUTIES OF SECRETARY.

SECTION 1. The Secretary shall keep the minutes and records of all meetings of stockholders, directors and Executive Committee, conduct its correspondence, and perform such other duties as may be required of him by the President, Executive Committee or Board of Directors. He shall approve all checks or orders drawn on the Treasurer.

ARTICLE VII. DUTIES OF TREASURER.

The Treasurer shall receive and disburse the funds of this Association subject to the control and approval of the Executive Committee.

ARTICLE VIII. THE EXECUTIVE COMMITTEE.

SECTION 1. The Executive Committee shall have the custody of the Seal of the Association, and shall have the power to direct the same to be affixed to certificates of the stock and bonds of the Association, to powers of attorney for the transfer of the stock of the Association, to certificates of registration, and to such other instruments as the by-laws authorize.

SEC. 2. The Executive Committee shall have the management of the Association; it shall keep minutes and report its action at every regular meeting of the Board of Directors, or as often as may be required by said Board.

SEC. 3. In the event of the death or absence or disability of both the President and Vice-President, it shall appoint a director who shall exercise the powers and discharge the duties of President during such disability, or until another President is elected by the Board of Directors. In case of the death or absence of the secretary the Executive Committee shall in like manner have power to appoint a Temporary Secretary.

SEC. 4. The Executive Committee shall meet at the office of the Association quarterly, and at such other times as they may appoint.

SEC. 5. Three members of the Executive Committee, together with the President, or a majority of the committee, if the President be absent, shall constitute a quorum for the transaction of business.

SEC. 6. The Executive Committee shall fix the compensation and define the duties of all officers, clerks and employes.

SEC. 7. It shall establish certain rules with regard to giving names to horses, and require those rules to be observed in the Register, so that all clashing and confusion from duplication or approximation may be avoided.

ARTICLE IX. STOCKHOLDERS.

Digitized by Google

SECTION 1. The annual meeting of the stock-

holders shall be held at the office of the Association, or such other place in the city of Chicago as the Board of Directors may determine, on the first Wednesday in the month of April of each year, at 12 M., for the election of Directors and such other business as may properly come before the Association, and the polls shall not be closed before 1 P. M. Notice of the time and place of meeting shall be advertised in WALLACE'S MONTHLY at least ninety days prior to the holding of such meeting.

SEC. 2. The stockholders shall at such meeting elect the directors by ballot, and those receiving the highest number of votes shall be declared elected. Each share of stock shall be entitled to one vote on any question.

SEC. 3. Any special meeting of the stockholders may be adjourned to a further day, but no business not specified in the original call, shall be introduced or considered at any adjourned meeting.

SEC. 4. All proxies shall be filed with the Secretary at or previous to the time for voting, and a committee of three shall be appointed to pass upon these proxies.

SEC. 5. All stockholders of this Association shall be charged only one-half of the regular registration fee upon animals owned and recorded by them.

ARTICLE X. REGISTRAR.

SECTION 1. The Registrar shall be appointed by the Board of Directors and shall hold office during its pleasure, and shall receive such compensation as the Executive Committee may fix. He shall receive and verify entries intended for insertion in the Register, subject to the Rules and By-Laws and approval of the Executive Committee. He shall edit and prepare the Register for publication, and shall revise the proofs and superintend the arrangement and publication thereof under the immediate control of the Executive Committee. He shall keep on file, properly labeled, all documents constituting the authority for pedigrees, and hold them subject to the inspection of any member of the Association; he shall keep records of the transfer of animals, and shall also edit such other publications and perform such other duties as the Executive Committee may direct.

ARTICLE XI. BOARD OF CENSORS.

SECTION 1. The Executive Committee shall appoint annually three persons who shall take charge of and have authority over all questions relating to pedigrees, record of performances, and be designated as the Board of Censors. The compensation for the services of the Board of Censors shall be fixed by the Directors.

SEC. 2. Its duties shall be to examine all doubtful pedigrees brought to its notice, in the published volumes of the Trotting Register, and instruct the Registrar to make all additions, erasures and corrections that should be made in any pedigree, and order it inserted in the next succeeding volume, as corrected, provided that no pedigree heretofore published in the Register can be changed unless ordered by the Executive Committee.

SEC. 3. When any disagreement arises between a party contributing a pedigree and the Registrar it shall be referred to the Board of Censors and after free hearing and examination of the evidence on both sides, the decision shall be recorded.

SEC. 4. In order to establish the truth and check fraud, the Board of Censors may order any unregistered pedigree inserted in the record of the Register in its true form without the application or wish of the owners, provided, however, that thirty days' notice shall be given to the owners.

SEC. 5. The Registrar shall keep a plain record of the proceedings and findings of the several boards, and not only the pedigrees themselves, but the evidence concerning them, shall be reduced to writing and filed in the office of the Association.

ARTICLE XII. AMENDMENTS.

SECTION 1. Amendments to these by-laws may be made at any meeting, annual or special, of the stockholders of the Association, or its Board of Directors, by a two-thirds vote; alterations of any rules of the Board of Directors by a majority vote.

SEC. 2. Notice of proposed amendment to the by-laws, or alterations of the rules, shall be furnished to the Secretary at least thirty days before the meeting at which it is proposed to consider them, and the Secretary shall cause the same to be printed and distributed to the stockholders fifteen days before the meeting.

The following proposed advanced standard to take effect on and after the first Wednesday in April, 1893, subject to the next annual meeting of the stockholders, was read, and after a prolonged discussion ordered laid on the table:

Proposed New Rules to be submitted to the Stockholders' Meeting, April 6, 1892, to take effect on and after the first Wednesday in April, 1893.

1. Any stallion that has a record of 2:30 or better, provided two of his get have records of 2:30 or better, and provided his sire or dam is already a standard animal.

2. Any mare or gelding that has a record of 2:25 or better.

3. Any mare that has a record of 2:30, provided her sire is standard and her dam is by a standard horse.

4. Any stallion that is the sire of four animals with records of 2:30 or better, or the sire of three with records of 2:25 or better, or two with records of 2:20 or better.

5. Any mare that has produced an animal with a record of 2:25, or two with records of 2:30 or better.

6. The progeny of a standard horse when out of a standard mare.

7. Any mare whose sire is standard, and whose first and second dams are by standard horses.

Standard for pacers the same, except they are to be recorded in a separate part of the volume, and given numbers with a cipher preceding them.

The produce of mares served in 1892 shall be eligible under the old rules, provided same are registered on or before December 31, 1893.

The report of the Executive Committee recommending that trotters and pacers be registered in different

Google

places in the same volume under the following standards, was duly adopted.

THE TROTTING STANDARD.

In order to define what constitutes a standard-bred trotting horse, and to establish a BREED of trotters on a more intelligent basis, the following rules are adopted to control admission to registration. When an animal meets the requirements of admission and is duly registered, it shall be accepted as a standard-bred trotting animal.

FIRST. Any Trotting Stallion that has a record of two minutes and thirty seconds (2:30), or better; provided any of his get has a record of 2:35 trotting, or better; or provided his sire or dam is already a standard trotting animal.

SECOND. Any mare or gelding that has a trotting record of 2:30, or better.

THIRD. Any horse that is the sire of two trotters with records of 2:30, or better.

FOURTH. Any horse that is the sire of one trotter with a record of 2:30, or better; provided he has either of the following additional qualifications: 1. A trotting record of 2:35, or better. 2. Is the sire of two other animals with trotting records of 2:35. 3. Has a sire or dam that is already a standard trotting animal.

FIFTH. Any mare that has produced a trotter with a record of 2:30.

SIXTH. The progeny of a standard trotting horse when out of a standard trotting mare.

SEVENTH. The female progeny of a standard trotting horse when out of a mare by a standard trotting horse.

EIGHTH. The female progeny of a standard trotting horse when out of a mare whose dam is a standard trotting mare.

NINTH. Any mare that has a trotting record of 2:35, or better, whose sire or dam is a standard trotting animal.

THE PACING STANDARD.

In order to define what constitutes a standard-bred pacing horse, and to establish a BREED of pacers on a more intelligent basis, the following rules are adopted to control admission to registration. When an animal meets the requirements of admission and is duly registered, it shall be accepted as a standard-bred pacing animal.

FIRST. Any Pacing Stallion that has a record of two minutes and twenty-five seconds (2:25), or better; provided any of his get has a record of 2:30 pacing, or better; or provided his sire or dam is already a standard pacing animal.

SECOND. Any mare or gelding that has a pacing record of 2:25, or better.

THIRD. Any horse that is the sire of two pacers with records of 2:25.

FOURTH. Any horse that is the sire of one pacer with a record of 2:25, or better, provided he has either of the following additional qualifications: 1. A pacing record of 2:30, or better. 2. Is the sire of two other animals with pacing records of 2:30. 3. Has a sire or dam that is already a standard pacing animal.

FIFTH. Any mare that has produced a pacer with a record of 2:25, or better.

SIXTH. The progeny of a standard pacing horse when out of a standard pacing mare.

SEVENTH. The female progeny of a standard pacing horse when out of a mare by a standard pacing horse.

EIGHTH. The female progeny of a standard pacing horse when out of a mare whose dam is a standard pacing mare.

NINTH. Any mare that has a pacing record of 2:30, or better, whose sire or dam is a standard pacing animal.

TENTH. The progeny of a standard trotting horse, out of a standard pacing mare, or of a standard pacing horse, out of a standard trotting mare.

The following rules and regulations governing performances against time were adopted:

PERFORMANCES AGAINST TIME.

Performances against time must be conducted in accordance with the following Rules and Regulations in order to be accepted for the purpose of Registration by the American Trotting Register Association:

Must be made at a regular meeting of a Society in membership with the National Trotting Association, or American Trotting Association, said performances to be conducted by the regular appointed Judges and Timers for the day, strictly in accordance with the Rules of said National or American Trotting Association adopted by the member.

No animal shall be permitted to start against time pending a heat or trial by another animal, nor until the result of such heat or trial shall have been duly announced.

Time shall be taken by not less than two, nor more than three timers engaged in the stand at the same time.

There shall be not less than three judges, during such performances, who shall not act as official timers.

No performance against time will be accepted if made before the regularly announced time for the commencement of the performances of the day, which shall not be earlier than 10 o'clock A. M.

No performance against time will be accepted if made at a postponed or continued meeting, unless such postponement or continuance is made in accordance with the rules of the National or American Trotting Association to which the member belongs.

No performance against time will be accepted unless the animal starts to equal or beat a specified time and accomplishes the feat.

A regular meeting is hereby construed to mean a meeting advertised in at least one newspaper not less than one week before the commencement of said meeting, and at which meeting no less than two regular events (purse or stake) one of which must take place on each day, to which entrance fee is paid or subscription made.

Entries to "performances against time" must be made with the Secretary not later than seven P. M. the day before the performance.

MATCH RACES.

Time made in Match Races between two or more horses will not be accepted, unless made over grounds of members of the National or American Trotting Association, said races to be conducted by the regularly elected or duly appointed officers of said member, strictly in accordance with the rules of said National or American Trotting Association.

Time made in "Matches against time" will not be accepted for purposes of registration, except as hereinbefore provided.

Messrs. Rockefeller, Smith, Emery and Sanborn were appointed a committee to nominate a Board of Directors.

The committee recommended that the old Board of Directors be elected with the following changes, viz.: S. A. Browne, vice Walter Clark; W. A. Sanborn, vice F. L. Coombs; M. W. Oliver, vice H. C. Jewett.

The report of the Committee was duly adopted, and upon motion the Secretary was instructed to cast the entire vote of the stockholders represented for the ticket nominated, which being done the following named gentlemen were declared duly elected, viz.:

W. R. Allen, Lucas Brodhead, A. C. Bruce, N. J. Colman, H. C. Chamblin, S. A. Browne, W. A. Sanborn, Carlos M. DeGarmendia, Van B. DeLashmutt, C. F. Emery, G. M. Fogg, F. S. Gorton, A. M. Garcelon, C. J. Hamlin, W. I. Hayes, W. M. C. Hill, George W. Hooker, W. P. Ijams, Morris J. Jones, M. W. Oliver, John L. Mitchell, H. C. McDowell, F. E. Perkins, F. Rockefeller, W. H. Raymond, S. H. Rundle, E. A. Smith, F. S. Waters and C. W. Williams.

Upon motion the meeting adjourned *sine die*.

CHICAGO, ILL., April 6, 1892.

MEETING OF THE BOARD OF DIRECTORS.

Immediately upon adjournment of the stockholders' meeting, the Board of Directors met pursuant to the by-laws.

Present: W. R. Allen, L. Brodhead, C. F. Emery, W. P. Ijams, N. J. Colman, Morris J. Jones, C. J. Hamlin, H. C. McDowell, A. C. Bruce, H. C. Chamblin, S. A. Browne, M. W. Oliver, F. Rockefeller, F. S. Waters, C. W. Williams and E. A. Smith.

The following officers were unanimously elected:

W. R. Allen, President.

F. S. Waters, Vice-President.

F. S. Gorton, Treasurer.

J. H. Steiner, Secretary and Registrar.

EXECUTIVE COMMITTEE.

L. Brodhead, F. S. Gorton, C. F. Emery, W. P. Ijams, N. J. Colman, Morris J. Jones, C. J. Hamlin.

The meeting adjourned subject to call of the President.

CHICAGO, April 6, 1892.

MEETING OF EXECUTIVE COMMITTEE.

Present: W. R. Allen, L. Brodhead, C. F. Emery, W. P. Ijams, N. J. Colman, Morris J. Jones, C. J. Hamlin.

The following

BOARD OF CENSORS

was appointed.

L. Brodhead, W. P. Ijams, C. F. Emery.

The action of the Board of Censors, as reported to the Executive Committee by reading the record of its several meetings, was approved, and the pedigrees covered thereby ordered changed as recommended by said Board.

Ordered that stallions registered under the pacing standard shall have a cipher prefixed to their number, and that said numbers shall commence with "01."

Meeting adjourned subject to call of the President.

J. H. Steiner
Secretary.

Corrections in the Register.

ON the 6th of April, 1892, the Executive Committee confirmed the action of the Board of Censors in the following cases and ordered the necessary changes made in the Register:

Waxana.—Registered in Vol. VIII, ordered corrected in Vol. XI, to read as follows: "Waxana, (5) ch m foaled 1878; by General Benton 1755; dam Waxy, by Lexington; g d Keenon Mare, by Brawner's Eclipse; g g d by Medoc; g g g d Mary Streshley, by John Henry; g g g g d Mary Hunter, by Harris Paragon, etc. [See Stud Book.] Bred by Leland Stanford, Menlo Park, Cal. Dam of Sunol, 2:08¼." The same correction is to apply to all of the produce of Waxana and Waxy which have been registered.

Fanchon.—This mare is registered as non-standard in Vol. VIII, and dam "said to be" by Silver Duke 663. Satisfactory evidence being submitted to prove the dam to be by Silver Duke, the "said to be" was ordered stricken out and the mare registered as standard under Rule 7 in Vol. XI.

Campaign 9811.—On evidence submitted to Mr. Wallace, a correction of this pedigree was made in Vol. IX, and the third dam given as Lucille, by Abdallah 15; fourth dam by Pilot Jr. 12. It has since been shown conclusively that this version of the pedigree is incorrect, and that the third dam was not Lucille, but another daughter of Abdallah 15, and that the pedigree of the horse as originally registered in Vol. VIII is correct. It was ordered that the original registration be restored and published in Vol. XI.

Altair 5010, Jay Bird Jr. 10831, Carrie Smuggler.—When the horse Altair was registered his dam, Lady C., was represented to be a daughter of Curtis' Hambletonian; subsequently the colt Jay Bird Jr. and Carrie Smuggler were registered in Vol. VIII, with the same breeding. At the meeting of the Board of Censors the pedigree was investigated, and the evidence proved conclusively that the mare, Lady C., was not by Curtis Hambletonian, but by a horse of comparatively unknown breeding that stood at Holton, Kan. In view of this fact it was ordered that the registration of the above-named animals be canceled and their names stricken from the list of standard animals.

Patara 12534.—This horse is registered in Vol. IX, as by Patron 2529; it has recently been ascertained that his dam, Starette, was

Digitized by Google

also served during the season of 1888, by Nugget 1398. A reference to the stud books of the Forrest City Farm shows that the mare Starette was served by Patron May 10, June 3 and June 29, 1888. The mare subsequently coming in season, at the request of her owner, was bred to Nugget on the 21st and 23d of July, and as the foal was dropped June 11, 1889, it is impossible to decide, with any degree of certainty, which of the two stallions is the sire of the colt. As the practice heretofore in similar cases has been to divide the honors between the two sires, the same course will be pursued in this instance, and the pedigree will be corrected in Vol. XI, to read: Patara, ch h foaled 1889, by Patron 2529, or Nugget 1398; dam Starette, etc.

Patchen Chief 3440, Seneca Bismarck 9397, Wykle 11280.—At the last meeting of the Board of Censors, it was decided that the above named animals were not entitled to registration as standard, and it was consequently ordered that their registration be canceled and the numbers withdrawn.

The facts are as follows: In Vol. V, Patchen Chief was registered as standard under Rule 7, as sired by Mambrino Patchen 58; dam Dixie, by Abdallah 15. It now transpires that instead of the dam being Dixie, a daughter of Abdallah 15, she was in reality a mare named Beck, *by* Dixie, a non-standard son of Abdallah 15. As Dixie was not a standard horse the discovery necessarily entailed the withdrawal of Patchen Chief. Where the pedigree, as registered, originated, it is impossible at this late date to ascertain, in fact it would appear that the whole trouble arose from a slip of the pen in omitting the word "by" and owing to the laxity of the requirements then in vogue the error crept into the Register unobserved.

In 1886 Mr. John W. Shelor, Tugaloo, S. C., purchased the colt Seneca Bismarck, by Victor Bismark 326; dam by Patchen Chief 3440; grandam by Joe Downing 710, and as there was at that time no suspicion of the irregularity in the pedigree of Patchen Chief, the colt was duly registered as standard, and subsequently the colt Wykle and several others were also registered. Now comes the discovery of the fatal error in the registration of Patchen Chief, causing the withdrawal of them all. A few months ago Mr. Shelor had what he supposed was a standard-bred colt, but he is now placed outside the pale, and that to, through no negligence or irregularity on his part.

It is certainly unfortunate that an innocent party should thus be made the victim of circumstances, for while it can not effect his honor or standing in the least, there is a possibility of a financial loss. It is far better, however, that the matter be settled at this time than that the error should continue, thus leading to endless complications, and greater loss, in the future.

Merkwood 15158.—This case, which came before the Board of Censors, is as unmitigated a fraud as was ever perpetrated. The facts are as follows: In February, 1891, J. D. Dunlop, Alpena, Mich., applied to MR. Wallace for the registration of the horse Merkwood, representing him as a chestnut horse foaled 1883 (bred by Charles G. Patterson), sired by Rysdyk 653; dam Nelly (bred by Charles G. Patterson), by Thomas Jefferson 304; grandam (bred by Charles G. Patterson), by Chestnut Hill 780; great-grandam by Foxhunter. He at the same time applied for the registration of the dam Nelly, stating that she was a chestnut mare foaled 1878.

On a request being made for evidence to prove the breeding, an affidavit was submitted which purported to be from the above-named Charles G. Patterson, in which that party swears that he purchased the Foxhunter mare in New York, and bred each of the dams above mentioned and vouches for the correctness of the breeding given.

On receipt of this affidavit the pedigree was accepted without further question and duly registered. A short time ago attention was called to the pedigree and within a few weeks we received such conclusive evidence that a fraud had been perpetrated that the matter was submitted to the Board of Censors, who ordered the registration canceled and the number withdrawn.

The evidence submitted proved conclusively that the man Patterson never bred a mare of any description, at any time, to either of the horses, Rysdyk, Thomas Jefferson or Chestnut Hill, and it further showed that Chestnut Hill had no foals prior to 1877, so that everything else aside it was a physical impossibility for a daughter of his to have had a foal in 1878 or for several years later. The facts exhibit a clear case of rascality. It is now necessary for Mr. Dunlop to exonorate himself; surely if he is not responsible for the fraud his is indeed a sad case of misplaced confidence, and it is incumbent upon him to expose the guilty parties.

Digitized by Google

Bismont 8546.—When this horse was registered in Vol. VII, he was entered as by Victor Bismarck 326; dam Ducky Almont, by Almont 33; grandam Little Duck, by Sinclair's Abdallah, son of Abdallah 15. At that time nothing whatever was known of the breeding beyond the grandam. Since then the horse has been purchased by Hon. A. B. Harris, Aurora, Ill., who, after a thorough investigation, has unearthed evidence which proves that the third dam was a daughter of Hunt's Highlander; fourth dam by Potomac, son of imp. Diomed, and the pedigree will be corrected in the current volume of the Register.

As Bismont proved himself a great racehorse last season, securing a record of 2:18½, and as his dam, Ducky Almont, is now a great broodmare, having also produced Memento Wilkes, 2:29, it is of general interest that the pedigree be thus extended.

Notes and News.

Messrs. Cassell & Company, of New York, London and Paris, have just made an announcement which will be of interest to horsemen everywhere. They announce, commencing April 25, the re-issue, in monthly parts till completed, of "Sidney's Book of the Horse," thoroughly revised and brought up to date. This work, on account of its magnificent proportions, had substantial claims to be considered as the general standard work on the subject in the language. It is quite a number of years since the last edition appeared, and since then how many "new worlds" of horse interest have been created! The name of the gentleman whose services have been secured as editor-in-chief of the mammoth undertaking, is, however, a sufficient guarantee that the ground will be thoroughly and carefully covered. The work will therefore have to be almost entirely re-written. In such event we may expect that the American trotter will receive proper recognition, as it is now to be found in nearly every horse-loving country under the sun. The horse interests in America are so many and varied, that it will only be by such editorship as we have been promised that this work will receive the patronage of the public here that it ought to deserve. We therefore wish Mr. James Sinclair, the gentleman selected as chief editor, the success we abundantly anticipate that will result from his association with the work.

Tuxedo, the game American trotter that gained "the record" in Britain "on three legs"—having lost a shoe at the commencement of the race at Alexandra Park, May 6, last season, is serving mares at the rate of fifty dollars each.

Glaucus and Mambrino Onward.—In the Year Book we published the summary of contests against time at Syracuse, Neb., November 2, 1891, by which Glaucus, by Whippleton, 1883, and Mambrino Onward, by Onward 1411, were credited with records better than 2:30. These animals also appeard in the alphabetical 2:30 list in the Year Book, but before the Great Table, giving performers under their sires, was completed, information reached us that these performances were irregular, and the horses were omitted under their respective sires. As these performances reached us in official form, the horses were registered as standard under Rule 1, Glaucus being numbered 17394 and Mambrino Onward 17395. An investigation shows that these contests against time took place in the early dawn, and the self-appointed officials who conducted the affair seemed to have had an utter lack of knowledge of the requirements governing such contests. The registration of these horses has been cancelled and the certificates of registration issued for them have been returned to this office.

Catherine, 3:30.—In the Year Book on page 318 we published a summary of the 2:35 race at Denver, Colo., in which Catherine, by Rush, was reported as winning the third heat in 2:30. This heat should be "no time," as the first and second horses were set back for running and the heat given to Catherine. She does not therefore belong in the 2:30 list, and her sire, Rush, comes out of the Great Table of sires. She has a record of 2:34½, made at Kansas City, Kas., September 11, 1891.

The Standard Horse Trotting Company, Kenosha, Wis., have recently sold to E. O. Jones & Son, Cambria, Wis., the highly bred trotting stallion Romantiker 13898, by Lord Russell, dam Novel, by Princeps; second dam Roma, by Golddust. This horse is not only very fashionably bred, but an excellent individual.

With the present month the trotting season begins, and during its continuance no horseman, breeder or any other person who takes an interest in the light-harness horse, his breeding and performances, can afford to be without all the information on those subjects that is to be had. No other publication con-

Digitized by Google

tains a tithe of the facts in the lines indicated that are to be found in the Year Book, and it is a gratifying indication of the esteem and confidence in which it is held that the first edition of the recently issued volume is already nearly exhausted. Consequently, those who intend purchasing for use during the trotting season should forward their orders at once, and they will be promptly filled. The price is $2.50, very little money indeed for a volume of nearly one thousand pages and which contains every conceivable fact in relation to the breeding, ownership and performances of the trotters and pacers that were on the turf last season, in addition to which facts there is a complete 2:30 table, a table of all the trotters and pacers that have become standard by performance arranged under their respective sires, the great Broodmare table, a table of sires of dams of 2:30 performers, etc. Volume X of the Register is selling rapidly, and all orders will be promptly filled, the price being $5. In this connection it is worth noting that the American Trotting Association gives this year to each of its members a copy of the Year Book, so that many of the annoying delays to horses so common in the past by reason of disputes as to records, are now entirely avoided so far as American tracks are concerned, the Year Book, supplemented with frequent bulletins from the Secretary's office, keeping all interested parties posted.

AN exchange calls attention to the indisputable but generally overlooked fact that in the general rush to make trotters of nearly all horses that wear harness the desirability and importance of teaching them to step quickly and well is too often overlooked. The first natural gait of a foal is the walk, and the second the gallop or run. At the present time there are of course nothing like as many long journeys made by the aid of a horse as in the days of our forefathers, but nevertheless it is still a welcome attribute in a driver, the ability to keep up a smart pace and to do it cheerfully when not forced into a trot. Men who have the initial handling of colts, are, in a great measure, responsible for the rapidity of their walk, and it should be the aim of such men to see that the colts are taught to walk five miles an hour, and do it without urging. Once acquired, the possession of a rapid walk will be of benefit should the colt as a matured horse develop into a trotter, and should he prove fit only for farm labor or business purposes, the fast walker will sell quickly where a "poky" animal would be a drug on the market.

A REPORT has been going the rounds of the papers to the effect that the black mare Blossom, that in the hands of Gee Grimes made a record of 2:20 last season, and on more than one occasion demonstrated that in addition to having plenty of speed she was a laster, was blind, but this is denied by her owner.

A SISTER to Belle F., 2:15¼, a record that was made some years ago in a race for the Charter Oak $10,000 stake at Hartford with "Knap" McCarthy in the sulky, recently foaled a colt by Pilot Medium. The dam of Belle F. also produced Kitty Van, 2:24, a mare that on one occasion when Ray Warner was driving her a race fell at the finish of a heat, Warner landing with so much force on the damp and almost frozen ground (the date was late in the fall) that he was unconscious when picked up. The mare that is the dam of these two mares was bought while running by the side of her dam, the old mare, and yet unweaned, foal becoming the property of a farmer in Michigan who has naturally never regretted the investment.

THE old-time pacer Buffalo Girl, 2:12½, has by her side a colt by Red Wilkes.

A SISTER to the Electioneer colt Advertiser, 2:16, as a three year-old in 1891, will be handled this season. She is owned at Palo Alto.

Two pacers of whom a good deal is expected are coming east from California this season. One of them, a starter in the slow classes, is Flying Jib. He is by Algona, a son of Almont that was foaled in 1876 and taken west to the ranch of J. B. Haggin, who has of late years become famous in connection with thoroughbred horses by reason of his ownership of Salvator, Tyrant and other stake winners, not to mention the importation from Australia of three stallions whose get are already showing that they can hold their own in races. Direct, the champion sidewheeler of them all, who also hails from California, is making a season in Kentucky, but he will be starting later in the season against his record of 2:06. A harness which weighs but four pounds has just been completed for Direct, and he will pull a thirty-eight pound sulky. This sort of vehicle will do for the billiard-table tracks of to-day, especially when the horse that draws them is so steady-going a fellow as Direct, but when Flora Temple and Dexter were lowering the harness record, a sulky weighing less than forty pounds would hardly have been safe.

Digitized by Google

TWENTY-SEVEN stallions have, at ten years of age, sired one or more trotters, two years old or under with records of 2:30 or better. They are: Acolyte, 2:21; Alcazar, 2:20½; Bell Boy, 2:19¼; C. F. Clay, 2:18; Chimes, 2:30¾; Garnet Wilkes; Guy Wilkes, 2:15¼; Happy Russell, 2:21½; Indian Hill; Jim Mulvenna, 2:27¾; Matadon; Norval, 2:17½; Patron, 2:14¼; Patronage; Quartermaster, 2:21¼; Russia, 2:29¼; Sable Wilkes, 2:18; St. Bel, 2:24½; Sidney, 2:19¾; Sir Knight, 2:23¾; Sphinx, 2:20½; Stamboul, 2:11; Sultan, 2:24; Wilkes Boy, 2:24½; Wilkie Russell, 2:15; William L. and Wilton, 2:19¼. The remarkable feature of this list is the fact that twenty-one of these twenty-seven famous young sires have records better than 2:30, ten of them have records better than 2:20, and one other, Chimes, a brother to two others in the list, Bell Boy and St. Bel, is credited with a mark of 2:30¾ as a three-year-old, which is evidence enough of the possession by him of standard speed. Eight of the stallions are represented by two or more two-year-olds in the 2:30 list, and of these eight Sidney has four and Guy Wilkes three. Sidney leads, it will be seen, and if pacers were admitted in the comparison, he would rank still higher, as in that event his yearling champion at the sidewheel gait, Fausta, 2:22¾, would cut quite a figure. Of the eight stallions in this list that have two or more 2:30 or better trotters, two years old or under, only one, Garnet Wilkes, is minus a record of 2:30 or better and he is by the developed sire Onward, 2:25¼, who was in turn by George Wilkes, 2:22. In fact, nineteen of the twenty-seven sires in the list are by developed stallions, so that on the whole the showing is a great one for the developed sire idea that has been so much exploited of late.

THE Flower City $10,000 stake that has been a feature of the Rochester (N. Y.) meeting for several years, failed to fill this season. The entrance was but five per cent., but as in nearly all the events on the program a ten per cent. fee was charged, the horsemen stayed away. There is no doubt that at all trotting meetings of consequence the day of the ten per cent. entrance fee has gone for good. It is an absurdity to suppose that men will continue to pay twice or three times as much in certain localities to trot their horses as the animals can be engaged for elsewhere, and, although the eastern tracks have thus far kept up the old rate of entrance, the experience of the Association at Rochester, in respect of the Flower City stake, will no doubt convince them that this year the western horses are not coming east when they can trot for all the money they want to nearer home at half the expense.

TROTTING-HORSE breeders in the vicinity of Buffalo, N. Y., and others in that part of the country who are interested in the advancement of the light-harness animal, are congratulating themselves on the fact that nearly a dozen down-town pool rooms that for a long time flourished in Buffalo have been closed by the authorities and the proprietors indicted. Without exception the trotting-horse interests are opposed to the permanent maintenance of pool rooms in cities. Public opinion upholds the selling of pools in connection with trotting meetings, and in the city pool rooms running races are the sole stock in trade of the men who back the game. Without the accompaniment of book-betting on an enormous scale the running turf could not exist for ten minutes, while, so far as the trotting interest goes, the betting is an incidental and unimportant feature.

JOHN GOLDSMITH, who for his years is perhaps the foremost driver of trotters in the country, having been especially successful in the handling of colts, as witness his lowering of the three-year old record to 2:18 with Sable Wilkes, capturing the two-year-old stallion record with Regal Wilkes when that horse trotted in 2:20¾, and placing the yearling mark at 2:29¾ with Freedom, is recovering from the severe illness which laid him low immediately upon his return to California early in the spring. It is Goldsmith's present intention to come east with some trotters this season, and it is understood that the son of James Goldsmith, who died last season, will begin learning the art and mystery of training and driving trotters under the supervision and direction of his uncle John.

As showing the tremendous increase of late in the trotting interest it may be mentioned that there are now nine mile tracks in Texas.

THE latest legislature to consider a bill to prevent and punish the "ringing" of horses is that of Massachusetts. Although not much is heard of it there is a considerable amount of crooked work in the way of trotting horses out of their class in the east, the smaller meetings, especially the state and county fairs in the fall, being a favorite field of operation for the manipulators of the game. So strong in some men, however, is the instinct to get

Digitized by Google

money dishonestly that if "ringing" were punished by hanging and quartering there would still be McGuigans and Garritys out for the currency every season.

No establishment in the country where the trotter is bred gives to the public more interesting news matter than the Allen farm. There has just been received at this office a bulletin of the foals of 1892 up to April 15, from which it appears that the average period of gestation for sixteen filly foals was 337 days, while the axerage for eight colts was 341 days. The maximum period for colts was 352 days, and for fillies 357 days. The minimum period for colts was 327 days, for fillies 316 days. The breeding of all the foals reported by the Allen farm is exceptionally rich. Pistachio, a brother to Nutwood, has had foals dropped from such mares as Jassamine, by Princeps, dam by George Wilkes; Lindora Wilkes, by Guy Wilkes, dam by The Moor; Edgewater Bell, the dam of Edgemark, 2:16, at four years; Peperomia, by Alcantara, dam Wenonah, by Curtis' Hambletonian, second dam Jessie Pepper. Kremlin, a son of Lord Russell, that as a three-year-old took a record of 2:22¼, has had foals dropped from Miss Majolica, 2:24½; Phallamont Girl, 2:27¾; Kantaka, 2:27¼, and others. Lancelot, the youngest son of Green Mountain Maid, is represented by foals from a sister to the great pacer, Arrow; Lyre, by Arthurton; Sun Maid, by Belmont; Waterleaf, a great-granddaughter of Waterwitch, and others. Mazatlan, one of the richest bred sons of Electioneer, is the sire of a bay filly whose dam is a sister to Redwald, 2:26½, by Lord Russell, second dam the famous Primrose.

KENDALLVILLE, IND.—We have just received from the secretary of the Trotting Association at Kendallville, Ind., the official summary of a race at that place in 1891, as follows:

October 2, 1891. Purse $—; 2:27 pace.

Prince Frederick, b h by Valentine.	1	1	1
Silver Cloud Jr., gr h by Silver Cloud	2	2	2
Brown Belle, br m—C. L. Carter..	3	3	3

Time, 2:26—2:32½—2:34.

THE bay mare, Troublesome, by Messenger Duroc 106; dam Lady Bryant, by Brignoli 77, died April 6, the property of Herndon Stock Farm, Clarksville, Tenn. This mare had a record of 2:25½, and was dam of Hildegard, by Harry Clay 45, the dam of Cheltenham, 2:28. Troublesome was bred by Charles Backman, Stony Ford, N. Y., and passed through the hands of Hon. B. F. Tracy, of Appalachin, N. Y., and Father Hendricks, of Union Springs, N. Y., to the Herndon Stock Farm.

Questions and Replies.

G. T. P., SALEM CENTRE, IND.—I have a colt bred as follows: Sired by Bassett M. 5795; dam Martha B., by Glenview; second dam by Andrews' Kemble Jackson, he by Collins Kemble Jackson; third dam by Dorsey's Golddust. 1. Is he standard bred? 2. Is he fashionably bred? 3. Is he bred well enough to keep for a stock horse? 4. Is his breeding good enough to make a speed horse?

ANSWER.—1. No. 2. No. 3. In these days of strong competition and demand for breeding up, we do consider a horse which is neither standard or fashionably bred desirable or valuable as a stock horse. 4. That depends more on his individual qualifications than on his breeding; we can not give you an opinion of any value without personal knowledge of the horse.

C. B. L., MONGAUP VALLEY, N. Y. 1. Who is now the owner of the dam of William Arthur, 2:19¼? 2. Is a filly by Defiance 2700, dam by H. W. Beecher, 2:28½, second dam by Gosher, standard bred?

ANSWER.—1. Do not know, her ownership is not recorded. 2. No. H. W. Beecher is not standard, although if his pedigree (by Phil Sheridan 630) is established, he would be eligible to registration as standard under Rule 1. The filly would then become standard-bred.

S. B., TISKILWA, ILL.—Is Captain Rono 12204, sorrel horse, four years old bred by James McKean, standard?

ANSWER.—The horse is registered as standard; Rono 12204, in Vol. IX, American Trotting Register.

G. H. E., INDEPENDENCE, KAS.—1. Give breeding, by whom and where bred, and record of Bashaw Chief 8886. 2. What has he sired, if anything?

ANSWER.—1. bl h foaled 1869; by Green's Bashaw 50; dam's pedigree untraced. Bred and owned at last accounts by O. F. Smith, DeWitt, Clinton Co., Iowa. No record. 2. None in the 2:30 list.

SUBSCRIBER, POINT PLEASANT, W. VA.—Give pedigree of Downing's Bay Messenger.

ANSWER.—b h foaled 183–; by Harpinus,

Digitized by Google

son of Bishop's Hambletonian; dam of Messenger and Rockingham Blood.

F. M. M., VIROQUA, WIS.—Is Azeca 3735 standard?

ANSWER.—Yes, registered in Vol. VI, American Trotting Register.

P. VAN A., DEFREESTVILLE, N. Y.—Can a mare, bred as follows, be registered as standard: Sired by Buckingham 82; dam Molly Harris, by Hector; he by Old Black Hawk; second dam by Harris Hambletonian. 2. If so, can a colt out of said mare, by Joe Wilkes 14359, be registered as standard? 3. Give breeding of Buckingham's dam. 4. Same of Hector's dam.

ANSWER.—1. No, the sire of her dam is not standard. 2. The colt would not be standard bred; a filly bred as stated, would be standard bred under Rule 7. 3. Buckingham's dam by Vermont Blackhawk 5; second dam a mare brought from Pennsylvania, pedigree untraced. 4. Hector's dam, said to be by Long's Eclipse, son of American Eclipse, further pedigree untraced.

A. S., DAYTON, OHIO.—Give record of the gray stallion Cadmus, by Cadmus Hambletonian.

ANSWER.—Record 2:45¾, at Jackson, Mich., September 23, 1891.

V. F., RICHMOND, MICH.—Did the sorrel mare, Belle W., win a heat or any part of the money at Hensall, Canada, in the fall of 1888 or 1889?

ANSWER.—We find no record of any performance by Belle W., at Hensall in 1889. On September 3, 1888, she performed in a race at Hensall won by Mabel B. Belle W. did not win a heat, and as the only account of the race published does not give division of the purse, we are unable to determine whether she won any money or not. Four horses started, and Belle W. was last.

Catalogues for 1892.

THE STANDARD TROTTING HORSE COMPANY.

DURING the year 1891 this company transferred its headquarters from Nebraska to Kenosha, Wis., fifty miles from Chicago, and the first catalogue issued from their new home is now ready for distribution. As the name of the company would indicate, all the animals in the catalogue are standard-bred and registered. The head of the stud is the highly bred stallion, Redwald 6178, record 2:26½, by Lord Russell 4677; dam Primrose, by Alexander's Abdallah; second dam Black Rose, by Tom Teemer. Lord Russell is own brother to Maud S., 2:08¾, and half brother to Nutwood, 2:18¾, the greatest living sire of trotters. Primrose is one of the greatest of the "Great Brood Mares," the dam of Redwald, 2:26½, Sineus, 2:27½, and Ichi Ban, 2:29; also dam of the noted trotting sires Princeps, Pluto, Maxim, Aldebrino and Parmenus. She has 103 descendants in the 2:30 list. With this grand lineage and the proved capacity to trot fast, Redwald is one of the most desirable of young trotting sires. The next horse in the catalogue, Pactolus 9102, is also a fast performer and related to some of the most successful sires and fastest performers on the turf. This horse has a three-year-old record of 2:24¾ and a four-year-old record of 2:22½; his sire is Patronage 4143, (full brother to Patron, 2:14¼) who at five years of age is sire of Alix, three-year-old record 2:16¼, and Pactolus, 2:22½. The dam of Pactolus is Buda, by Tramp 303; second dam Burrie (dam of Brocade, 2:28), by Captain 805, 2:28½; third dam Kate Carman, by Green's Bashaw 50. A glance at this pedigree shows that it is made up of performers and producers. Romantiker 12898, by Lord Russell, dam Novel, by Princeps, is the third horse mentioned, but has recently been sold. Pontoon, by Patronage 4143; dam Dolly Brighton, by Tramp 308; second dam Lady Brighton, by Bashaw 50; third dam Flora, by Draco 116, 2:28½, is bred much in the same lines as Pactolus, and as in his case the pedigree fairly bristles with prepotent trotting strains. The younger horses advertised for service are Arnolph 13955, by Romantiker 12898, dam Birthday, by Robert McGregor; and Delpho 13954, by Patronage 4143, dam Delphine, by Tramp 308, each being limited to ten approved mares. A number of highly bred colts of 1891 are fully set forth and advertised for sale. A notable feature of the catalogue and the pedigrees contained therein is the large number of animals with the Tramp-Green's Bashaw cross, and the pedigrees and stud performances of these two prepotent trotting sires occupy several pages of the book. Thirty-six broodmares and fillies are catalogued, the first being the pride of the farm, the great trotting mare Alix, two-year-old record 2:30, three-year-old record 2:16¼. This mare is by Patronage 4143; dam Atlanta, by Attorney 1005; second dam by General Hatch 139; third dam by Iowa, thoroughbred son of imp. Glencoe. If not sold her owners announce that Alix will be

Digitized by Google

trained and specially prepared to beat the present four-year-old trotting record, Sunol, 2:10½. We have not space for a detailed description of the other mares and fillies, they are by Patronage, Tramp, Romantiker, Attorney, Robert McGregor, Redwald, Sunbright, Shadeland Onward, Guelph, Hobart and other well bred sires, out of dams of fashionable and producing trotting strains.

ELMHURST FARM,

Lexington, Ky., is owned by Schmulbach & Park, of Wheeling, W. Va., and the catalogue, a handsome book of sixty six pages, contains the history and pedigree of fifty-two animals. Elmhurst Farm is especially rich in Electioneer blood, nine stallions by that greatest of trotting sires being included in the catalogue. Three are advertised for public service, viz.: Curtis Brown 12436, by Electioneer; dam Edith Carr (dam of Campbell's Electioneer, 2:17¼), by Clark Chief. Golden Slope 12437, by Electioneer; dam Addie (dam of Woodnut, 2:16¼, and Manon, 2:21, and grandam of Arion, 2:10¾), by Hambletonian Chief; second dam Manton, by Harry Clay 45, and Electro-Benton 15027, by Electioneer; dam Nettie Benton, by General Benton; second dam Nellie Walker (dam of Warlock, 2:28½, and *Peruvian Bitters*, 2:23½), by Thornedale; third dam Rosalind, 2:21¾, by Alexander's Abdallah; fourth dam Burch Mare, by Brown Pilot. The other sons of Electioneer owned at the farm are Barnitz 15921, dam May, by Wildidle; Electrum 16676, dam Clair, by Arthurton; Vincenzo 5392, dam Victoria, by Don Victor; Electnut 18432, dam Amrah (dam of Electwood, 2:30), by Nutwood; Chief Envoy 18481, dam Miss Beecher, by Piedmont, and Parkville 6050, dam Aurora, 2:27 (dam of Arol, 2:24, and Hazel, 2:28), by John Nelson. The broodmares, twenty-five in number, are, without exception of the best and most fashionable trotting strains, sired by Guy Wilkes, Director, Piedmont, Robert McGregor, Nutwood, Bell Boy, Azmoor, George Wilkes, Allie West, Award, Cuyler, Red Wilkes, Belmont, Dictator, Happy Medium, Kentucky Prince, Mambrino Patchen, Sultan and Electioneer. The dams of these broodmares are as well bred as the sires, and their individual excellence is in many cases attested by their stud or turf record, the list including Algath, 2:23; Audacity, sister to Prelude, 2:28¼; Grace Hamilton, sister to Bonhomie, 2:25; Ida Elliott, dam of Parnell, 2:30; Kitty Wilkes, 2:30, sister to Miss Wilkes, 2:29; Sister Wilkes, 2:22¾; Sophia, sister to Abbie, 2:26¼; Stella, 2:30, and others. Colts and fillies of 1890 and 1891 and a few highly bred geldings complete the list of this fashionable and desirable collection of standard trotting-bred animals. Visitors to the farm will be cordially welcomed on all week days by Mr. R. C. Estill, who has charge of the stock. The superintendent of the training department is John F. Payne. The farm is situated on the Winchester Pike, four miles east of Lexington, Ky.

SOUTH ELKHORN.

R. P. Pepper & Son, the proprietors of South Elkhorn Stock Farm, Frankfort, Ky., have issued for 1892 their eighteenth Annual Catalogue of Trotting Stock. The catalogue is a book of 340 pages, containing the pedigree and description of more than three hundred highly bred animals. South Elkhorn is one of the foremost breeding establishments in the country, and has for many years furnished a large number of fast and famous light-harness performers. The farm is situated at Frankfort, Ky., and all visitors, whether purchasers or not, are always welcome. The stallions offered for public service in 1892 are Onward, Norval, Madrid, Nutpatch and Striker. The famous stallion, Onward 1411, record 2:25¼, is one of the greatest and most successful sires in America, by George Wilkes 519, dam the great broodmare Dolly (dam of Director, 2:17; Czarina, 2:21, and Thorndale, 2:22¼), by Mambrino Chief; at sixteen years of age he has forty-nine 2:30 performers, seventeen producing sons and six producing daughters, and thirty-eight grandsons and daughters with records of 2:30 or better. A list of his produce would include many of the most famous turf performers and campaigners. The second stallion, Norval 5335, has a record of 2:17½, by the great Electioneer, dam Norma, by Alexander's Norman; he is sire of Norhawk, 2:20¼ at three years; Novelist, 2:27 at two years, and Norlaine, yearling record 2:31½. Madrid 1835 is by George Wilkes; dam Mercedes, by Belmont; second dam Minerva (dam of Nugget, 2:26¾, and Meander, 2:26½), by Pilot Jr. Madrid is sire of Cognac, 2:20; Charlie R., 2:30, and Cortez, 2:28½; also of dam of Calyco, 2:29½. The fashionable and prepotent Nutwood strain is represented at South Elkhorn by Nutpatch, by Nutwood, 2:18¼ (sire of seventy-seven 2:30 performers); dam Patchen Maid (dam of Astral, 2:18), by Mambrino Patchen; second dam Lady Elanor, by Mambrino Chief. Striker, the last stallion on the list, was bred at South

Digitized by Google

Elkhorn, he is by Onward; dam Cachuca (dam of Catchfly, 2:18¼), by Almont; second dam Madame Smith, by Grey Eagle; third dam by Saxe Weimar. To attempt even a list of the 138 broodmares owned at South Elkhorn is not practicable with the space at command. They are all bred in the purple, famous turf performers with fast records, great broodmares, the dams of great campaigners, highly bred mares and fillies in foal to the great stallions above described, are found on nearly every page, and youngsters out of these mares are fully described and offered for sale at fair prices. Among the most noted mares are Annette, record 2:25¼; Belle Thorne, grandam of Nuthurst, 2:26; Cachuca, dam of Catchfly, 2:18¼; Catchfly, 2:18¼; Chenille, sister to Acolyte, 2:21; Ella Louise, sister to Uncle Sam, 2:23¼; Fanchon, dam of *Tangent*, 2:18½; Gleaner, sister to Attraction, 2:28¼, and Interest, 2:18; Lady Alice, dam of Acolyte, 2:21; Laura S., dam of Prelude, 2:28¼; Missal, grandam of Benoni, 2:28¼; Mistress, dam of Dumas, 2:19; Naomi, sister to Boaz, 2:19¼; Nashville, dam of Trumpeter, 2:23½; Ruth, dam of Boaz, 2:19¼; Santa Claus, dam of Emulation, 2:21, Vatican, 2:27¼, Position, 2:22¼, and Magic Wilkes, 2:29¼; Susette, 2:28¼, and Trifle, sister to Mikeagan, 2:19¾. Prelude, 2:28½; Promoter, 2:28, and Vatican, 2:27¼, are also owned at South Elkhorn, and included in the catalogue.

Our New Advertisers.

THE road carts and sulkies manufactured by W. S. Frazier & Co. are known and appreciated wherever the light-harness horse is used. This firm was among the first to introduce and manufacture the light cart now universally used by road riders and trainers of trotting and pacing horses. They are builders of improved forms of vehicles for the development of the trotting horse. Send for their illustrated catalogue, which contains information of value to every one owning or driving a good horse. The factory is at Aurora, Ill. Office and salesroom 373-375 Wabash Avenue, Chicago.

SCHMULBACK & PARK, of Wheeling, W. Va., advertise in this issue eight Electioneer stallions for the season of 1892, at Elmhurst Farm, Lexington, Ky. Three of these are offered for public service, viz.: Curtis Brown 12436, a brother to Campbell's Electioneer, 2:17¾; Golden Slope 12437, out of the grandam of Arion, 2:10¾, and Electro Benton 15027, brother in blood to Sunol, 2:08¼. The others are private stallions. For full information in regard to these horses address R. C. Estill, Lexington, Ky. They also advertise Parkville 6050, by Electioneer, out of the dam of Arol, 2:24, to make the season of 1892 at Ashwood, Tenn., in charge of Polk & Brown.

W. H. MARRETT, 125 World Building, New York City, will furnish all standard horse and turf publications at lowest rates, including Wallace Year Book, 1891, and Vol. X American Trotting Register.

THE Stallion Service Book published by A. L. Schaeffer, Paris, Ill., is fully worth the price asked for it, one dollar.

THE advertisement of the American Sportsman, published at Cleveland, Ohio, appears in this issue. It is a weekly independent turf paper, and is offered to subscribers from date to January 1, 1893, at the low price of one dollar, with a copy of the American or National Trotting Association Rules free.

THE Woodburn Farm advertise their annual sale of yearlings in this issue—see foot of their page advertisement. The sale takes place by electric light at the American Horse Exchange, New York, on Saturday, May 21.

CHANGES of interest to horsemen are made in the advertisements of R. P. Pepper & Son, Frankfort, Ky.; the Standard Horse Company, Kenosha, Wis., and Miller & Sibley, Franklin, Pa.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal*. The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ACTION 17783, (6) b h foaled 1891; by Kilrain 7899; dam Lucille, by Sentinel Wilkes 2499; g d Peosta, by Bashaw 50, etc. [See Lucille, Vol. IX.] Bred by John Simpson, Scranton, Pa.; passed to Dungan & Shepard, Kearney, Neb. [Vol. XI.]

APPENDIX TO TROTTING REGISTER.

ANIMALS NOT STANDARD.

NOTE.—Copies of pedigrees from the non-standard department of any volume of the Register will be published here on the same conditions as stated at the head of "Standard Animals." Under the current rules, the following are eligible to entry in the Register as non-standard: 1. Mares, fillies and geldings by standard horses. 2. Animals that are historical and worthy of preservation. Stallion colts can not now be registered unless they possess two standard crosses.

DARA, (6) b m foaled 1883; by Sorrento 2164; dam Senorita, by Bona Fide 720, etc. [See Vol. V.] Passed to G. E. DeLong, Mt. Elgin, Ont., Can.; then to O'Riley Fitten, Simcoe, Ont., Can.; then to J. A. Colter, Brantford, Ont., Can.

DEW DROP, (7) b m foaled 1889; by Young Wilkes 951; dam Madge, by Hambletonian Prince 819, etc. [See Vol. X.] Passed to A. W. Holthouse, Alleghany, Pa.; then to F. H. Bierbower, Maysville, Ky.

DEXTERITY 5641, (6) ch h foaled 1886; by Robert McGregor 647; dam Mary Oakes, by Young Jim 2009, etc. [See Vol. VII.] Passed to Abbie Weiand; then to C. C. F. Blanchard, Ballinger, Tex.

DIRECTRESS, (6) br m foaled 1886; by Director 1989; dam by Abbottsford 707, etc. [See Vol. VII.] Passed to G. Lee Chrisman, Lee's Summit, Mo. [Vol. XI.]

DON ANTEROS 14716, (6) br h foaled 1890; by Anteros 6020; dam Bonnie Bee, by Harry B. 4309, etc. [See Vol. X.] Passed to L. J. Johnson, Kansas City, Mo.

DON ALVAR 14520, (6) b h foaled 1889; by Granby 2489; dam Shirley, by King Rene 1278,

Digitized by Google

etc. [See Vol. X.] Passed to M. A. Leach & Bro., Elkhart, Ill. February, 1891.

ELITE, (7) b m foaled 1881; by Commodore Belmont 4340; dam Bettie, by Sentinel 280, etc. [See Vol. VI.] Passed to Ringeling Bros., Philipsburg, Mont.

FULLERTON MAID, (7) b m foaled 1884; by Masterlode 595; dam Kitty, by Magna Charta 105. [See Vol. VIII.] Passed to N. A. Williams, Genoa, Neb.; then to Thomas F. Miller, Fullerton, Neb.

GAMMARIUS 7822, (6) b h foaled 1887; by Gambetta Wilkes 4659; dam Effie Davis, by Red Wilkes 1749, etc. [See Vol. VII.] Passed to James Thompson, Valley Falls, N. Y.

GARLAND, (7) b m foaled 1883; by Commodore Belmont 4340; dam Sue Preston, by Forest King 1754, etc. [See Vol. VI.] Passed to Ringeling Bros., Philipsburg, Mont.

GRACE, (7) b m foaled 1882; by Dauntless 3158, dam Maud, by Night Hawk 514, etc. [See Vol. X.] Passed to Thomas Skelton, Big Rapids, Mich.

GUYON 2487, (6) b h foaled 1882; by Princeps 536; dam Roma (dam of Romance, 2:29½, and Farce, 2:29¼), by Golddust 150, etc. [See Vol. V.] Passed to S. P. Salter, Lexington, Ky.; then to C. T. Bethel, News Ferry, Va.

GWENDOLINE (6) b m foaled 1885; by Abdallah Wilkes 7562; dam Isabel, by Idol 177, etc. [See Vols. VII and IX.] Passed to W. J. Sutton; then to Leonard Allison, Newburgh, N. Y.; then to William H. Harris, New York, N. Y.; then to W. C. Reid, Oxford, N. C.

HA HA 1219, (1, 6) br h foaled 1880; by Nephew 1220; dam by Black Hawk 767, etc. [See Vol. IV.] Passed to Harvey Belden, Stockton, Cal. Record 2:22¼.

HENRY THORN 10937, (6) b h foaled 1884; by Hawthorne 10935; dam Jollyette, by Nutwood 600, etc. [See Vol. VIII.] Passed to Cary Culver, Longmont, Colo.

H. G. O. 1232, b h foaled 1877; by Rysdyk 653; dam Kate (dam of Orient, 2:24), pedigree not traced. [See Vol. IV.] Passed to Hiram Walker & Sons, Walkersville, Ont., Can.; then to A. W. Van Loghem, Kalamazoo, Mich.; then to Isaac R. Sherwood, Canton, Ohio; then to Moody & Rodman, Deland, Ill.; then to N. J. Crawford, Sycamore Springs, Kas.; then to W. E. Smith, El Dorado, Kas., April, 1887.

HOPE, (6) b m foaled 1889; by Onward 1411; dam Jenny, by King Rene 1278, etc. [See Vol. X.] Passed to E. C. Clark, Cadott, Wis.

INDIAN DICK 9973, (6) br h foaled 1888; by India 6366; dam Gyp, by Jubilee 3213, etc. [See Vol. VIII.] Passed to Martin Crocker, Mt. Clemens, Mich.

IRMA JEANETTE, (6) b m foaled 1889; by Red Wing 7609; dam Ollie Scott, by Strathmore 408, etc. [See Vol. X.] Passed to C. H. Aldrich, David City, Neb.

ISABELLA, (7) b m foaled 1889; by Sultan 1513; dam Katie Eastman, by Enfield 128, etc. [See Vol. VIII.] Passed to Uihlein Bros., Truesdell, Wis.

ITHMAR 15128, (6) b h foaled 1886; by Aberdeen 27; dam Louisiana, by Happy Medium 400, etc. [See Vol. X.] Passed to Henry H. Budgett, Long Prairie, Minn., March 15, 1892.

JERSEY WONDER 16242, (6) b h foaled 1890; by Jersey Wilkes 2516; dam Lady Star, by American Star 37, etc. [See Vol. X.] Passed to C. W. Radford, Oshkosh, Wis.

JOHN HIRD 15883, (6) b h foaled 1890; by Arthurton 365; dam Lucerne, by Princeps 536, etc. [See Vol. X.] Passed to J. E. Davis, Moberly, Mo., November 1891.

JUDGE HEADLEY 14823, (6) b h foaled 1890; by Judge Salisbury 5872; dam Lady Offutt, by Norman 25, etc. [See Vol. X.] Passed to G. S. Hildahl, Austin, Minn.

JURIC COSSACK 6898, (6) b h foaled 1887; by Don Cossack 980; dam Louisville Maid, by Woodford Mambrino 345, etc. [See Vol. VII.] Passed to J. H. Steiner, Cataract, Ind.

KALONA, (7) b m foaled 1888; by Woodford Wilkes 2528; dam Phoebe B., by Western Chief 695, etc. [See Vol. VIII.] Passed to H. S. Judson, Morris, Minn.

KITTY HEATH, (7) b m foaled 1887; by Mambrino Rattler 1356; dam Maggie Heath, by Louis Napoleon 207, etc. [See Vols. IX and X.] Passed to Thomas McEwing, Bancroft, Mich.

LADAKH 12085, (6) ch h foaled 1889; by Lockheart 6864; dam Festus, by Baymont 1027, etc. [See Vol. IX.] Passed to J. C. Taylor, Dawson, N. Dak.

LADY H., (6) b m foaled 1887; by Tennessee Wilkes 2735; dam Juno, by Enfield 128, etc. [See Vol. VIII.] Passed to Powell Bros., Shadeland, Pa.

LADY KENWOOD, (7) b m foaled 1884; by Red Cross 1813; dam Misgan, by Harry Clay 45, etc. [See Vol. VII.] Passed to E. S. Smith, Springfield, Ill.

LADY MAY, (7) b m foaled 1884; by Pennsylvania 1433; dam Kate Fisher, by Ledger 1669, etc. [See Vol. IX.] Passed to William Adams, Youngstown, Ohio.

LADY SIMMS, (9) ch m foaled 1885; by Pennypack 2445; dam Sally Winters, by Woodstock, son of Australian, etc. [See Vol. XI.] Passed to Judy Bros., Attica, Ind. Record 2:32½.

LANINA, (6) b m foaled 1889; by Baymont 1027; dam Hermione, by Hospodar 1217, etc. [See Vol. IX.] Passed to H. S. Judson, Morris, Minn.

LAUTANA, (7) b m foaled 1879; by Almont Mambrino 761; dam Queen Dido (dam of Red Wilkes 1749), by Mambrino Chief 11, etc. [See Vol. IV.] Passed to D. H. Moore, Athens, Ohio.

LEMO 16077, (6) br h foaled 1891; by Allie Wilkes 6225; dam Elaine, by Jefferson Prince 6212, etc. [See Vol. X.] Passed to George Spalding, Monroe, Mich., April 12, 1892.

LEOTA, (7) b m foaled 1889; by Woodford Wilkes 2528; dam Delta, by Baymont 1027, etc. [See Vol. IX.] Passed to E. J. Jones, Morris, Minn.

LEXA, (7) b m foaled 1891; by Bona Fides 6100; dam Nelly, by Pelham Tartar 4699; g d Bay Jenny, by Black Hawk Messenger; g g d Black Jenny, said to be by imp. Mercer. Bred by J. G. Cadham, Niagara Falls, Ont., Can.

LEXTELL, (6) b m foaled 1889; by Brighton 1510; dam Dilemma, by Trouble 509, etc. [See Vol, IX.] Passed to Brown & Polk, Ashwood, Tenn.; then to Thomas H. Malone, Nashville, Tenn.

LORETTA, bl m, foaled 1877; by Startle 290; dam Ella Sherwood, by Black Hawk (Vernol's), etc. [See Vol. III.] Passed to G. O. Wilson, Baltimore, Md., January 12, 1892.

LOUIS EASTIN 15373, (6) b h foaled 1890; by Joe Eastin 7614; dam Jenny Carter, by Regulator 3113, etc. [See Vol. X.] Passed to D. D. Mitchell, Albion, Mich.; then to C. H. McLeod, Missoula, Mont.

LOYOLA, (6) ch m foaled 1890; by Greystone 6164; dam Olga, by Hambrino 820, etc. [See Vol. X.] Passed to Scott Dougherty, Wabash, Ind.

LUCY THOMAS, (7) b m foaled 1887; by New York Dictator 5200; dam Toby by Sterling 4447, etc. [See Vol. IX.] Passed to J. T. Long, Lane, Kas.

MABEL, (7) bl m foaled 1880; by Mambrino Howard 3656; dam Contention, by Allie West 745. [See Vol. IX.] Passed to James Dority April 1, 1885; then to George H. Ketcham, Toledo, Ohio, October 20, 1891.

MACKINAW 7569, (6) b h foaled 1887; by Arthurton 365; dam Silicia, by Princeps 536, etc. [See Vol. VII.] Passed to A. J. Haws, Johnstown, Pa.; then to George J. Snyder, Allentown, Pa.

MAGGIE KNOX, (7) b m foaled 1885; by Winthrop Knox 13629; dam Fan, by Vermont 322. [See Vol. X.] Passed to A. W. Hewit, Dayton, Ore.

MARY FIELDEN, (7) b m foaled 1890; by General Wilkes 8493; dam Nelly Nutter, by John Burdine 7217, etc. [See Vol. X.] Passed to J. T. Willis, Augusta, Ga.

MARY FOSS, (5) br m foaled 18—; pedigree not established. Passed from Mr. Foss to S. H. Sweet, Chicago, Ill.; then to L. C. Merrick, Oconomowoc, Wis. Dam of Abram, 2:25.

MARY PLATT, ro m foaled 1870; by Tom Wonder 147; dam Trotting Janie, by Morgan Norman (Townsend's) or Black Hawk Morgan, etc. [See Vol. II.] Passed to C. N. Ackerson; then to J. O. Aldrich, Bath, N. Y.

MASCOTTE MAID, (8) b m foaled 1882; by Royal Fearnaught, 1501; dam Fancy, by Gallatin, son of imp. Scythian, etc. [See Vol. VI.] Passed to Pliny Watson, 1887; then to George H. Ketcham, Toledo, Ohio, January 14, 1891.

MATTIE KENNEY, (7) b m foaled 1889; by King Almont, 1276; dam Lucy C., by Messenger Chief 1825, etc. [See Vol. IX.] Passed to William McGregor, Windsor, Ont. Can.; then to William H. Elliott, Detroit, Mich.

MEDITATOR 12376, (6) bl h foaled 1888; by Grand Regent 4172; dam Ailsie Medium, by Happy Medium 400, etc. [See Vol. IX.] Passed to George S. Cross and Eugene Munson, Rantoul, Ill.

MIDGARD 5589, (6) br h foaled 1885; by Mambrino Dudley 967; dam Amanda Wood, by Hambletonian 10, etc. [See Vol. VI.]

Digitized by Google

Passed to T. J. Yarrow, Philadelphia, Pa.; then to J. W. Cromwell, Cynthiana, Ky., August 30, 1890; then to S. F. Tolmie, Victoria, B. C., April 5, 1891; then to Tolmie Estate, Victoria, B. C., May, 1891.

MINNEHAHA, (8) b m foaled 1883; by Chicago Volunteer, 2611, dam Wilson Mare, by Princeton; g d Dolly (dam of *Fuller* 2:13¾), by Niagara Champion, etc. [See Vol. IX.] Passed to Briethaupt Leather Co., Berlin, Ont. Can.

MISS ALLIE, (6) ch m foaled 1888; by Allie Wilkes, 3873; dam Abby Darling, 2:37, by Erie Abdallah 129, etc. [See Vol. IX.] Passed to D. W. Firestone, New Lisbon Ohio.

MISS MACEY, (6) b m foaled 1889; by Macey 2617; dam Nutmeg by Smuggler 927, etc. [See Vol. IX.] Passed to E. J. Meyer, Canton, Ohio.

MODRED 15394, (6) b h foaled 1889; by Lumps 3922; dam Isabella, by Wedgewood 692, etc. [See Vol. X.] Passed to J. C. Cook, Hackettstown, N. J.

MONTGOMERY BELLE, (7) b m foaled 1885; by Belvidere 1218; dam by Florida 482. [See Vol. IX.] Passed to I. J. Whitmarsh, Pine Bush, N. Y.

MOUNTEBANK 12313, (6) ch h foaled 1888; by Pluto 1950; dam Merry Bird, by Swigert 650, etc. [See Vol. IX.] Passed to A. Schicketanz, Plainfield, Ind.

MOX-MOX 10719, (6) b h foaled 1884; by Almont Jr. 1829; dam Golddrop, by Mambrino Patchen 58, etc. [See Vol. VIII.] Passed to Mary R. Florence, Victoria, B. C.; then to W. R. Elliott, Grand Forks, N. Dak.

MYRTLE, (6) b m foaled 1886; by Nil Desperandum 1389; dam Kentucky Heiress, by Kentucky Prince 2470, etc. [See Vol. IX.] Passed to M. B. Richardson, Lime Rock, Conn.

NANCY HANKS, (2, 6) br m foaled 1886; by Happy Medium, 400; dam Nancy Lee, by Dictator 113, etc. [See Vol. VII.] Passed to J. M. Forbes, Boston, Mass. Record 2:09.

NELLY, (7) b m foaled 1882; by Guide 1197; dam Nell Hank, by Wild Bashaw 698, etc. [See Vol. VI.] Passed to C. A. Butterfield, De Witt, Iowa.

NELLY G., (7) b m foaled 1887; by Idol Gift 2814; dam Nelly D., by Abraham 353, etc. [See Vol. VIII.] Passed to Edward Moir, Marcellus, N. Y.

NORA NORMAN, (5, 7) b m foaled 1871; by Blackwood 74; dam by Norman 25, etc. [See Vol. VII, p. 302.] Passed to Powell Bros., Shadeland, Pa. Dam of Ocola, 2:23.

NORENE, (8) b m foaled 1887; by Masterlode 595; dam Fancy, by Gallatin, son of imp. Scythian, etc. [See Vol. X.] Passed to C. A. Hayes and H. Dettloff, Chippewa Falls, Wis.

NOYA, (2, 6) b m foaled 1885; by Kentucky Prince 2470; dam Prolific, by Electioneer 125, etc. [See Vol. VII.] Passed to Uihlein Bros., Truesdell, Wis. Record 2:24.

NUTGROVE 5040, (6) b h foaled 1883; by Nutwood 600; dam by Princeps 536, etc. [See Vol. VI.] Passed to John E. Madden, Lexington, Ky.; then to James McGuire, Belleville, Ont., Can.

OPHELIA, (6) b m foaled 1887; by Strathmore 408; dam Zora, by Smuggler 927, etc. [See Vol. VIII.] Passed March, 1889, to C. F. Steen, Sandusky, Ohio.

OWASCO 11580, (6) ch h foaled 1889; by Inheritance 4492; dam Lena Rivers, by Blackwood 74, etc. [See Vol. IX.] Passed to Powell Bros., Shadeland, Pa.

PEARL TRAMP 13671, (6) b h foaled 1888; by Fredmont 1144; dam Allorie, by Alfred 2609, etc. [See Vol. IX.] Passed to Wilson Bros., Cave City, Ky.

PHILLIP'S PHŒNIX 7086, (6) ch h foaled 1884; by Starmont 1526; dam Charmer, 2:31, by Bay Champion, son of Champion 807, etc. [See Vol. VII.] Passed to William M. Singerly, Philadelphia, Pa.

PILOT GIRL, (6) br m foaled 1890; by Sprague Pilot 2458; dam Lucy Wilkes, by Bourbon Wilkes 2345, etc. [See Vol. X.] Passed to Hans Krause, Cleveland, Ohio.

PIT-A-PAT, (6) b m foaled 1885; by Triumvir 2546; dam Norma Bright, by John Bright 566, etc. [See Vol. VII.] Passed to L. J. Johnson, Kansas City, Mo.

PRINCE HARRISON 12520, (6) b h foaled 1888; by Harrison Chief 3841; dam Molly Hedges, by Abdallah Mambrino 3715, etc. [See Vol. IX.] Passed to J. W. Fitzgerald, Maysville, Ky.; then to A. F. Dehm, Lane, Kas.

REGAL COSSACK 13974, (6) b h foaled 1889; by Don Cossack 980; dam May Queen, by American Clay 34, etc. [See Vol. X.] Passed to J. P. Mallette, Englewood, Ill.

VOL. XVIII. JUNE, 1892. No. 4.

Entered according to Act of Congress, in the year 1891, by AMERICAN TROTTING REGISTER ASSOCIATION, at Washington, D. C.

TERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

THE METHODS OF PALO ALTO.

BY S. T. H.

IV.

IN grappling with this problem, involving the further infusion of thoroughbred blood in the American trotting horse. Senator Stanford seems to realize that the temperament of the pure-bred broodmare may be so high strung as to incapacitate her offspring for trotting purposes. In the exceedingly valuable interview to which frequent reference in these papers has been made, he thus elucidates his position:

"I long since realized that there never "was a really great horse that did not "have a dam that also possessed great "qualities. Our fathers, unfortunately "for the breed of American horses, ar-"gued differently. They held that the "sire was everything, the dam scarcely "anything of value, except to bear and "suckle the colt. Now I early recog-"nized the fallacy of this proposition, "and, in doing so, Palo Alto occupies the "high rank it does as a breeding estab-"lishment."

"*In selecting a thoroughbred breeding mare, I judge largely by the shape of the head and the expression of the eye. If the head and the eye do not suit me, although the conformation and breeding may be perfect, I pass her by. For, although a horse does not trot with his head, yet without he has a head I hold he can not trot.*"

It must be remembered that Senator Stanford makes all the broodmare selections at Palo Alto, and that level-headedness in the dam is to his mind a *sine qua non*. The question as to how completely a steady, sensible, honest trotting sire can control flightiness amounting almost to hysterics in the dam, so that the produce will be just as reliable as the sire, is one of the most curious phases of the breeding problem. The sire undoubtedly controls, to a great extent, the outward formation. Otherwise there could be no such a result as a family likeness. Outward conformation just as appreciably determines the style of action. Otherwise the movement would be at war with the physiological conditions, which is manifestly an impossibility. The nervous organization has been attributed to the dam by learned authorities. Can an exceedingly high-strung, excitable, nervous organization in the dam be so controlled by the earnest, reliable disposition in the sire as to preserve in the produce the inordinate ambition of the dam, so attuned as to be useful and practical for greater trotting speed and sustained effort?

If it can be thus utilized in the trotting-bred dam, can the controlling influence be extended to the thoroughbred mare?

It is generally conceded that thoroughbred mares are much more excitable than trotting-bred dams that have a dash of the blood of the common stock of the country. Not that they have either less sense or intelligence, for in that respect they are undoubtedly superior, but that they have vastly more ambition, which at times brings on a nervous paroxysm frequently witnessed on the running turf. When the blood of the thoroughbred, for instance, is excited by the incidents of the start, she is oftentimes so transported with nervous hysteria as to be almost un-

Digitized by Google

controllable. To this fact, more than to any other, is to be attributed the long delayed starts on the running course.

To expect steadiness of disposition in the thoroughbred dam, or in her produce by a trotting sire, when the excitement of the race course rouses all the fire of their royal ancestry, would seem to be a more unreasonable anticipation than to hope for a calm lake in the midst of a roaring mountain torrent.

Yet such are the complicated inconsistencies which beset the breeding problem, that reliability of brain in the successful dam of great trotting performers is neither a desideratum nor a necessity. In this respect nothing is more remarkable in the entire range of trotting-horse literature than the mental characteristics of the great trotting broodmares.

The citation of a few striking instances both in and out of the confines of Palo Alto are pertinent to this review.

In the year 1872 Lady Maud, then only five years old, placed herself ninth among the great performers of that year. On the 10th day of October that season she won the third heat of her race at Prospect Park in 2:22½, and secured the fourth heat in 2:22¼. This performance awakened a genuine surprise in the turf community, because she was the first one of his produce to call attention to her sire, General Knox, as a stock horse; just as the splendid five-year-old performances of George Wilkes were the first turf events that directed the breeders' observations to Rysdyk's Hambletonian. In 1875 she lowered her record to 2:18¼, which stands foremost among the records of the sons and daughters of General Knox. Throughout her turf career, which was as severe as it was brief, she was exceedingly unsteady and nervous. Her ambition was so intense that the race course acted upon her as it did upon the exceedingly high-strung, nervous organization of the dam of Lexington. Her appetite was enormous at home for a little animal, but it was lost in the excitement incident upon the speeding in company on the turf; and the scours added so much physical weakness to her mental ecstacy that she required the greatest care in conditioning and handling to make her even occasionally reliable in her races. Yet, at twenty-two years of age she produces, to the fourteen-year-old Red Wilkes, the two-year-old wonder Monbars, whose record of 2:16½ immediately after the exhaustion of traveling across the broad continent, places him only second to the incomparable Arion. "Arion's dam, Manette," says Senator Stanford, in the very recent interview quoted from, "is some-"thing of a runner herself. She is a "high-strung, nervous mare, *too much so* "*to handle for trotting purposes. On* "*that account she has been used as a* "*teaser for trotters at Palo Alto, and* "*it was found that she could run like a* "*thoroughbred.*" Yet she produces Arion, whose breeder describes as a large, good-natured colt, and who has made the wonderful record of 2:10¾ without a break at two years old. The remarkable peculiarities of these two great trotting colts are alike. Neither require weights, nor any artificial appliances to balance their action. Neither are flighty, notwithstanding the nervous excitability of their dams, but so wonderfully well poised, both in physical equilibrium and in mental resources that they do not seem to know how to run. Neither have shown any evidence of weariness in their great trials, but finish the last quarters with a resolute determination that challenges the admiration of the most enthusiastic devotee of the thoroughbred race horse. Both are trotting bred, not only on the sire but on the dam's side. "One swallow does not make a summer," but it is the harbinger of the coming spring nevertheless.

These two instances may not be enough upon which to predicate a generalization, but they give earnest of a conclusion that subsequent facts will enforce. To illustrate:

The dam of Bell Bird was a continual source of mortification to her breeder, Senator Rose, every time he started her in a race. She would invariably break, he writes, at the first turn, and dance up and down, like a hobby horse, till the field had trotted a distance away from her, and then, suddenly recovering her sanity, would leap forward into her beautiful trot, and come home abreast of the leaders. Her yearling daughter, Bell

Digitized by Google

Bird is full of exuberant spirits, yet she trots a record-breaking mile without a mistake in 2:26¼, and finishes the last quarter with the resolution of Allerton.

But the excitable nervous organization of the successful trotting dam, amounting at times to hysteria, does not depend solely upon these recent instances. Gipsey Queen, the dam of the champion trotting stallion, Thomas Jefferson, in his day, was given ten-mile races with Captain McGowan, simply because her greed for speed was so insane that mile heats never satisfied her tremendous ambition. She was exceedingly nervous, and tremulous when drawn for a race. Princess, too, was a terror to James K. Eoff. She would pull at the most savage bit, like Rosa Bonheur's chargers going to the fair, till he became pallid from exhaustion. If she could have been more easily controlled, and her turbulent ambition subjected to regulation. she always had the speed to beat Flora Temple as easily in mile heats as she did in her two-mile race. This exuberance of nerve force cropped out in the speed and steadiness of the produce of her son, Happy Medium. In tracing the subtle influences that have combined to produce Nancy Hanks, the courageous vitality of the once famous Princess must be distinctly enumerated.

Tackey, the dam of Pilot Medium, like all the daughters of Pilot Jr., was noted, pre-eminently, for two characteristics—her bold, lofty trotting action, and her headstrong ambition, which, by carrying her headlong into double breaks, lost her many a contest that was well within her capacity. Yet, besides being the dam of Naiad Queen, 2:20¼; Pilot Boy, 2:20; and Class Leader, 2:22¼, she produced the splendid sire Pilot Medium, who has not only risen to the first rank among the young trotting sires of extreme speed, but is honored by sons and daughters, like Jack and Lady Bullion, who trot their races throughout the season without making a single break.

Perhaps the most remarkable instance of nerve force, culminating in excitability amounting to horse lunacy, is that of Lady Duval, the dam of Pequot, 2:26, and of Happy Thought, 2:22½. She was a daughter of Strader's Cassius M. Clay, dam by imported Glencoe. She was bred and handled as a road mare by the eminent horseman, Mr. Samuel J. Morgan, from whom Senator Stanford purchased Piedmont. His patience was equal to his skill as a reinsman.

Both were of the highest excellence. The writer has seen Lady Duval indulge in a short, idiotic canter for ten miles at a stretch, with her eyes flashing and her lips quivering and her swollen veins standing out from her thin skin like hardened whip cords, while her sprightly ears and highly wrought nervous organization were alike deaf to the soothing, comforting tones of her loving owner's voice. If any horseman had, then and there, predicted that some day she would be ranked among the great broodmares, who, by the record, would produce distinguished trotting speed and steadiness, he would have been consigned to the same class of mental excitables to which she undoubtedly belonged, among equines.

In the line of these reflections how notably deficient are the catalogues of the great breeders and the works of the famous trainers, as to the mental characteristics of the great matrons. If Mr. Marvin in his admirable work had given to his readers the mental characteristics of the dams of the great performers he has developed at Palo Alto, and Mr. Splan had presented us with the nervous elements in the dams of the great horses he has placed upon the roll of honor, like Rarus and Johnston; if Dr. Herr and Mr. Alexander and the other great breeders had noted, not only the action and speed, but what in this connection is more valuable, the intensity of vitality and temperamental peculiarities of their successful broodmares, it would have formed a mass of important statistics upon which the student of the breeding problem could have reasoned to an impregnable conclusion.

The writer knows from observation that Sue Dudley, the dam of Grosjean, 2:30, and of Mambrino Dudley, 2:19¾, was almost unmanageable from nervous excitability. Indeed, once in her headlong desperation, while taking her exercise, she plunged and bucked and jumped till at last she reared up, pointing her

Digitized by Google

forward hoofs up higher than her sharp ears, she lost her center of gravity and fell over backward, breaking her dock, so that her tail hung limp and deformed forever afterward. Mary Mays, the dam of Ralph Wilkes, had the same ungovernable temper. She was worked with patiently till five years of age without becoming submissive to harness restraint, and when, at last, her turbulence seemed to be at an end, she was hitched to a light corn cultivator, as a means of making her steady, without straining her with severe draft service. But she resented the discipline by kicking the machine to pieces, and was sold by her owner for uncontrollable incorrigibility. Even the queen of the trotting harem, old Green Mountain Maid, was made a matron early in life because she could not be rendered safe in harness. The table of great broodmares abounds with instances in forcible illustration of this fact.

In every case we have mentioned these high-strung, excitable broodmares have produced extreme speed and reliability, coupled with courageous gameness. The extreme speed may have been transmitted by both sire and dam, but it is as certain as a demonstration in Euclid, that the sire can not produce extreme speed from a sluggish, phlegmatic, apathetic, what is termed a dull-tempered dam. Such a broodmare has never yet risen into prominence. All down the list the great performers have been blessed with high-strung dams, either rich in trotting blood, exclusively, or richer by the commingling of the best running strains in their pedigrees. An excess of vital power or nerve force, amounting in most cases to nervous or temperamental excitability in the dam, therefore, seems to be almost necessary to insure great results in the trotting foal. The performer that has such a dam never submits to defeat with apathy, but the vital power that has come to him through his dam urges him on for the victory, every inch of the mile, from start to finish. It is impossible to imagine Arion sulking when called upon for his speed, or longing for his driver's seat in the last quarter.

The mystery about this excess of vital power in the dam is that it seems to be completely controlled in the produce by the intense trotting temperament of the sire. For this reason, if for no other, there seems to be abundant warrant for the use of thoroughbred mares at Palo Alto for trotting dams; but not because, as Senator Stanford concludes, they are level headed either on the run or on the trot. The tremendous ambition of the thoroughbred to forge ahead, at some gait, is undoubtedly transmitted to the foal, no matter what may be the lineage of the sire. The trotting sire may control the excess of the dam's excitability in the foal with more certainty if the dam is trotting-bred, and with less certainty if the dam is thoroughbred, for the manifest reason that, in the former instance, the inheritance is to trot, while in the latter the ambition is to run. But if the sire is either deeply in-bred, like Egbert, or strongly bred in the best combination of trotting lines, like George Wilkes, having the pronounced trotting formation and intense trotting instinct and reliable temperament and remarkable trotting preprotency, like Electioneer, the half-breed produce, like Palo Alto, may with more than exceptional success inherit the trotting gait and train on to marvelous speed. His courage and endurance will be insured to a peradventure, and when he is in the hands of a master, like Marvin, and can stand the amount of training to produce steadiness without breaking down, he will endure a throat-latch struggle every inch of the mile, without resorting to his other inheritance, the gallop, to maintain the lead, as he did in his memorable contest with the trotting-bred gelding, Jack, in which he made the fastest time ever recorded in a trotting race to that date. But the best possible trotting conformation must be united with the most intense trotting inheritance, as in the instance of Electioneer, to control this temperamental excitability in the dam, whether she is trotting or thoroughbred.

There has been too great a tendency among recent turf writers on the trotting horse to divorce conformation from that subtle inheritance derived from the blood elements called heredity. More than a decade ago Mr. H. T. Helm produced a

Digitized by Google

book on the most successful trotting stallions, based largely upon the comparative length of the muscles of locomotion of the front and hind pairs of limbs. He attempted to prove that the relative length of the muscles from hip to hock and from the superior surface of the forearm to the knee, with reference to the length of the cannon bones of both pairs of limbs determined the trotting action. Long forearms and short cannon bones, he affirmed, gave a greater extension of the front feet with a less elevation of the knee than if the forearms were short and the cannon bones longer, as in the case of the Canadian trotters. The same law of action, he contended, obtained when the length from the center of the hip to the point of the hock was long. and from the point of the hock to the center of the ankle joint was short. Undoubtedly there is much of truth in these conclusions. If the author had not relied too implicitly upon these tape-line measurements of the extremities but had comprehended the entire conformation with reference to ascertaining the most successful structure for ultimate trotting speed, his volume would have been one of more reliable reference than it is now regarded. Veterinary authorities insist that the thoroughbred has a distinctive structural type. He is high and sharp at the withers, and rises at the coupling to nearly if not quite equal to the forehanded measurement.

The pacer, as we have seen, has the forehanded formation of the thoroughbred, but differs materially at the coupling, for his hips droop with such a marked obliquity that the drooping rump of the pacer has become a distinguishing feature. Now, it has been said that the trotter goes in all shapes, which, to the ordinary observer, may be accepted as a truism. But, in these varied shapes, is there any peculiarity of structure common to the vast majority that fixes the trotting structural type? Mr. Helm demonstrated why certain proportions produced a wide or lofty hind stride and why certain other relative lengths effected either a long, low, or a lofty, short, forward action, but his investigations never rose to the generalization why horses that could be made to trot fast had, as a general rule, a certain peculiarity of physical structure that admitted of this trotting education with the least possible delay. The conclusion to be sought after is not whether the action is high or low, long or short, wide or close, but is there a certain formation of the carcass that is conducive to trotting action as there is for the running and for the pacing movements?

The mystery of mysteries is that imported Messenger, of all the thoroughbred horses, both domestic and imported, should have established the controlling, predominant race of American trotters. That he possessed the trotting inheritance from his sire, the English Mambrino, whose owner, Lord Grosvenor, offered to wager a thousand guineas that he could trot fourteen miles within the hour, is beyond question, but that he alone had this gift of more than the usual trotting speed among thoroughbreds, the history of imported Trustee and imported Australian and imported Scythian and of Planet and many other thoroughbred horses conclusively disprove. In contradistinction to the formation of the average thoroughbred did imported Messenger have the distinctive "trotting pitch," that is, *did he stand higher behind, over the coupling, than at the withers*, and, therefore, possess the exact poise when standing at rest that the speediest trotter assumes in full motion?

By far the most scholarly and exact information bequeathed to posterity on "Imported Messenger and his Descendants" are the reminiscences of the late David W. Jones, under the *nom de plume* of Long Islander, and of his personal friend, whose soubriquet is "Nimrod."

In the chapter contributed by Mr. Jones on "The Blood Horse of New York" April, 1856, to Frank Forrester's Horse of America, Vol. I, page 150, he thus graphically writes:

"Well do I remember Messenger when standing at the stable of Townsend Cock! His large, bony head, rather short, straight neck, *with his low withers, and shoulders somewhat upright*, but deep, close and strong.

"*But behind these* lay the perfection and power of the machine. His barrel loin, hips, and quarters were incomparably superior to all others."

Digitized by Google

Nimrod, in *Wilkes Spirit of the Times* for January, 1866, thus corroborates this physical appearance:

"Messenger was a powerful horse, "*not very stylish*, but had a great share "of game." To Messenger the fountain source of American trotters can thus be distinctly traced the peculiar physical conformation of the "trotting pitch," from the testimony of eye witnesses, to whom the value of such a structure never possibly occurred. In the *Spirit of the Times* of February, 1866, Mr. Jones, under the *nom de plume* of Long Islander, thus describes Messenger's best son, Mambrino: "He was a bright bay, with "a small star and one white hind ankle, "full sixteen hands high, with great "length of body, good width of breast, "and beautifully turned and spread in "the quarter." He does not mention the character of his withers, but adds: "Nimrod was never more in error "than when he remarks that Mam-"brino was no trotter himself. *I rode* "*Mambrino* many miles. He was never "driven. I have been the breeder and "owner of many good trotters, and I say, "with entire confidence, that he was the "best natural trotter I ever threw a leg "over. His walk was free, flinging, and "elastic. His trot was clean, square and "distinct, with a beautiful roll of the "knee, *and great reach of the hind leg.*" The last clause clearly indicates the long-drawn-out hind quarter, which finds its completion in that altitude of the coupling for which it will be shown so many of his descendants are noted. In the chapter above referred to in "The Horse of America," Mr. Jones describes Mambrino as being "*upright in shoulders*, close in the hips, *long in the buttock*, and remarkably spread in the stifle." An upright shoulder invariably terminates in a broad, low wither, so that Mambrino thus conforms, forehanded, to the structure of his sire, imported Messenger. Next in the order of succession is Treadwell's Abdallah. None of the earlier sires have been described with more fulsome praise and condemnation than old Abdallah. Nimrod, in *Wilkes' Spirit of the Times*, for January, 1866, describes him as "the most singular to look at of all the colts he had ever seen." "He had a large, bony head, mule ears, an ewe neck, and was as narrow behind as a poor laying hen." "Then he had a kind of elephant tail, it being almost without hair, except a bunch at the end." So great was this derogation of Abdallah, that his owner, Col. John Treadwell, was wont to say, according to Long Islander, that "the horse will be remembered when those who are trying to make a fool of him will be dead and long forgotten." But in none of the famous descriptions of Abdallah, either in his stud bills, or in the language of Long Islander, or in the well-known word painting of William T. Porter, can anything be found that indicates the relative heights of his withers and couplings, except the single mention of Nimrod, that he was ewe-necked, which demanded a low carriage of the fore parts, and would, therefore, indicate a higher conformation behind the saddle place. With the birth of his incomparable son, Rysdyk's Hambletonian, seems to have been ushered in an era of more precise information as to all data concerning the science of breeding the trotting horse, and in no department more valuable statistics than those bearing upon the importance of the correct physical conformation. In the *American Horse Breeder* for February 27, 1892, page 187, that very capable horseman, Mr. John Minchin, in giving a description of the Charles Kent Mare, the dam of Hambletonian 10, says, that, "in the early fall of 1846, while owned by the young New York butchers, Charles Kent and Daniel Sweeny, in whose wagon she did her share of daily drudgery, "she "was unhitched from the wagon, a sad-"dle was put on her, William Whelan "mounted and rode her over the Union "Course, Long Island, and trotted her a "mile in 2:42!"

Gratifying as this information is, thus authenticated, the description which it has brought out from the same writer in the New York *Sportsman*, for April 9, 1892, of the "The Charles Kent Mare," is a more valuable supplement in this connection. He thus portrays her: "A "beautiful brown, 15.3 hands and finely "proportioned, with an iron constitution, 'the finest set of limbs imaginable, *with* "*the greatest driving power I ever saw on*

Digitized by Google

"a mare, and which she transmitted only "in a greater degree to her first-born, "Hambletonian. She showed all the "characteristic features of the Bellfoun-"der family, viz.: higher behind than "before, which her posterity can boast of "to the present day."

Nothing more valuable, in the same number of lines, has ever been contributed to turf literature than these descriptions of the speed and physical structure of the royal dam of the first emperor of trotting sires.

In Hambletonian was thus united not only the trotting heredity of the speedy Messenger line, and of the still more speedy Bellfounder lineage, but the physical structure of the "trotting pitch" which, from the beginning of his reign to that of his grand-daughter, Sunol, is a distinguishing characteristic of the greatest trotting turf sires and performers.

Beyond all comparison the most able "In Memoriam" of Rysdyk's Hambletonian, of the many brilliant sketches of his life and services, that were published in the turf press immediately after his death, which occurred during the night of March 26, 1876, was the one that appeared in the *Spirit of the Times* for April 1, 1876. On page 191 the writer thus describes the dead king: "His "shoulders were fairly oblique, deep and "strong. *The upper points of the blades "were well apart, giving him a low, "broad formation through the top of the "shoulders, with next to no withers, sway "short and coupling smooth. His hip "was long and croup high, with great "length from hip point to hock.* His "well-sprung ribs, topped with great fil-"lets of muscle, running back along the "spine, gave extraordinary width to the "loin. Still back of there it swept away "into the immense and powerful machin-"ery that, imparted to his sons and "daughters, has ever placed them in the "foremost rank of trotters. . . . .

"He always stood considerably higher "over the rump than at the withers, and "the whole rear, or propelling part of "the machinery was sometimes called "disproportionately large on that account, "but the eye failed to detect any de-"ficiency or want of size in front, *save "that his withers were low.* . . . . .

"As an evidence of the immense reach "which his admirable rear construction "enabled him to obtain, it was often no-"ticed by visitors that in his favorite at-"titude, as he stood in his box, his off "hind foot was thrown forward so far "under him as to nearly touch the one in "front of it, an attitude which few horses "of his proportionate length could take "without apparent effort, yet which he "assumed at perfect repose. . . . .

"The casual observer might think for the "moment, as he saw him in perfect re-"pose, that he was too massive for action, "but the instant he moved the thought "was dispelled, *for he was all action.* . " . . . . It showed a true and ad-"mirable adjustment of parts, and a per-"fect stability and elasticity of mechan-"ism that showed throughout every move-"ment. Many have noticed and endeav-"ored to account in different ways for "this peculiarity, some crediting it to the "pliable pastern, others to a surplus of "knee and hock action, *but, in fact, the "trait is not limited to the influence of "any one part.* There seems to be a "suppleness of the whole conformation "that delights to express itself in every "movement and action of the horse."

Since the above quotation was made the writer has learned that this tribute to Hambletonian was written by no less a master of trotting literature than the meritoriously admired Peter C. Kellogg.

The science of breeding had not then far enough advanced to take cognizance of the "trotting pitch," and the writer, unconsciously, was presenting in clear and concise language the perfection of that structural formation and the admirable display of its locomotion without realizing its importance. If he had thoroughly appreciated the depression at the withers and corresponding elevation over the coupling he would have taken the measurements and preserved them in his pen portraiture for the instruction of future generations. Still, working in the dark so far as relates to the "trotting pitch," Mr. Helm made these measurements in the year 1876, just before Hambletonian's death. But, strange to add, that, in the extended chapter on Hambletonian, the relative height at the withers and over the coupling is not men-

Digitized by Google

tioned, that information being given incidentally in a succeeding paper on Volunteer. "Hambletonian's rump was one "inch higher, he informs us, than his "withers, and so was that of his first "great son, Volunteer."

It is exceedingly interesting, as well as instructive, to trace the "trotting pitch" through his most successful sons and grandsons, not only as sires but as performers of the very highest character. Electioneer was higher over the coupling than at the withers. Like his sire he received this conformation from both sire and dam; and this structural type supplementing his intense trotting lineage, not only accounts for his speed and prepotency, but for the uniform speed and similarity of trotting pitch conformation of his progeny. In a recent letter received from Mr. Charles Backman, by the writer, he corroborates these assertions.

"Green Mountain Maid," he says, "in "her prime, measured fifteen hands and "half an inch over the withers, and fif-"teen hands and one inch over the coup-"ling.

"My man Hogan is quite positive "about the measurements of Electioneer. "He was fifteen hands one inch and a "half over the withers, and fifteen hands "two inches over the coupling." Now mark the result!

"All the old mares produce seemed to "have natural speed as soon as they are "broken.

"Electioneer was never handled for "speed, as I did not speed anything "young then, *and but very little now.* "The fall after he was three years old he "was driven a quarter around the turn, "to a heavy skeleton wagon, that we "used for breaking colts, in thirty-eight "seconds. He was driven to show a "number of my friends. The day was "so windy they would not leave the barn; "and, for that reason he was driven "around the turn." Now let us trace how persistently he transmits this formation to his great performers.

Mr. Charles Marvin writes: "Palo "Alto is decidedly higher behind than "in front, but not so much so as Sunol."

Mr. Robert Bonner supplements this statement with the following more exact information:

"Sunol measures sixteen hands at the "withers, and sixteen hands one and "three-quarters inches over the coup-"ling.

"Maud S. measures fifteen hands three "inches at the withers, and sixteen hands "at the coupling."

While this altitude behind undoubtedly augments the propelling power, it does not determine the style of action. For instance, the anterior outward pointing of the stifles will produce a wide action behind, and the relative length of the muscles of the forearms, with reference to the length of the front cannon bones, will determine whether the front action will be lofty and bold, or long, low and gliding in articulation. Thus, in his communication, Mr. Bonner further adds: "Maud S. as was the case with Dexter, "has abundance of knee action, while "Sunol has a long, low, frictionless "stride, with very little knee action. "Before I saw her in harness, Hickok, "than whom there is no better judge, "said to me, 'no man can tell without a "watch, when she was at speed, how fast "she was going, she moves with such "ease.' The day after he made this "remark, I timed her a quarter in thirty-"one and a quarter seconds, on the Palo "Alto track. As it had rained the night "before, and the track was heavy, Mar-"vin did not urge her. Colonel Strader "and other gentlemen who timed her with "me thought she was going about a 2:20 "gait. We were all surprised when we "looked at our watches, and found that "she had trotted the quarter at a 2:05 "gait."

Other great sons and daughters of Electioneer bear out this superiority of form in the exemplification of the "trotting pitch," but the citation of the two best that carry the world's trotting records, strengthened by the corroborative measurement of Maud S., is sufficient to prove that this proposition is not a theoretical chimera.

If this formation obtained in the Electioneer branch of the Hambletonian family, the skeptical student of the trotting-horse problem might conclude that it was simply a freak of nature, notwithstanding the strongly marked "trotting pitch" of Hambletonian himself; and the fact that

Digitized by Google

he did not transmit to his descendants, as a rule, but only in the exceptional case of Electioneer, would tend to show that it was an accidental peculiarity, rather than a meritorious conformation. But the evidence that he did thus persistently mark his most distinguished sons with this superior elevation, over the coupling, is simply overwhelming. George Wilkes, by the record, is the next most successful son of Hambletonian. His owner, Mr. William L. Simmons, thus concisely describes him:

"George Wilkes was a strong fifteen-hand horse, *with a pronounced trotting pitch.*"

Incomparably his best son is Red Wilkes. Mr. France thus writes of his conformation: "He stands sixteen hands "high at the withers, and sixteen and "three-quarters of an inch over the coup-"ling."

Perhaps the two most deeply inbred among the sons of Hambletonian are Messenger Duroc and Egbert. Nothing, it is universally conceded, intensifies structural as well as mental peculiarities like incestuous inbreeding. Messenger Duroc, by Hambletonian, out of Satinet, by Roe's Abdallah Chief, who was sired by Hambletonian, grandam by a son of Mambrino, the sire of Abdallah, is thus described by Mr. Backman: "When "Messenger Duroc was in his prime he "measured sixteen hands and a quarter "of an inch over the withers, and sixteen "hands and three-quarters of an inch "over the coupling."

Egbert, still more closely inbred, by Hambletonian, dam Camptown by the inbred Messenger Duroc, grandam also by a son of Hambletonian, was recently measured by his owner, Mr. W. W. Estill. He says: "Egbert is fifteen and "three-quarters hands at the withers, "and nearly an inch higher at the coup-"ling." This list, to the probable surprise of careful trotting-horse students, could be extended indefinitely. Thus Mr. Budd Doble writes: "Nancy Hanks measures fifteen hands and three-quarters of an inch in front, and fifteen hands and an inch behind."

Mr. G. W. Ingraham sends the measurement of Delmarch as "fifteen hands, "one and a half inches at the withers, "and fifteen hands two and three-quar-"ter inches at the coupling."

Major McDowell writes that Dictator, now in his thirtieth year, measures exactly fifteen hands high at both withers and coupling; but extreme age would equalize these measurements; for, as Mr. Simmons adds, in his communication: "the trotting pitch of George "Wilkes was more marked in his youth."

Allerton is the prominent exception to the rule among the great trotting performers. But his fore-handed altitude has been greatly exaggerated. Mr. Williams writes that he is only one-quarter of an inch higher over the withers than at the coupling. But if he is decidedly higher fore-handed, that does not vitiate the conclusion logically reached.

Not the least effective method of proving the almost universality of a rule is to mention the exceeding scarcity of the exceptions. The fact that the head of the Hambletonian family, Rysdyk's Hambletonian and his two most successful sons, Electioneer and George Wilkes, and his two closely inbred sons, Messenger Duroc and Egbert, had a pronounced trotting pitch, enforced by the further fact that Sunol, Maud S., Palo Alto and Nancy Hanks, the four fastest trotting performers, all grandchildren of Hambletonian, also have the "trotting pitch," is amply sufficient to establish the conclusion that the highest form of the trotting horse that will insure the greatest speed and uniformity of a high grade of trotting produce is the superior elevation of the coupling over the withers.

When Mr. Wallace wrote the able treatise on breeding the trotting horse, that prefaces the third volume of the Trotting Register, he based the fabric of trotting entity upon trotting instinct. "When we look at the pointer dog," he wrote, "we read his pedigree in his con-"formation, appearance, expression, and "style of action. *He has been bred to a "physical as well as a mental stand-"ard.*" Not so with the trotter. "There "is no uniformity in size, conformation, or expression." The success of Governor Stanford is shown in his producing the champion trotters that have a physical as well as a mental standard; and that physical conformation is so striking that

Digitized by Google

the horse at rest has precisely the same poise which the carcass assumes when up to its full trotting momentum. No words could more aptly and forcibly describe it than the phrase, "the trotting pitch."

This general conformation of the trotting carcass has no reference to specific measurements of the extremities, which was the rock upon which the brilliant Helm was wrecked; nor does it control the length of the carcass; nor does it affect any peculiarities of the inclination of either the elbow or the stifle. All these may vary widely in different animals that are gifted with great trotting speed. These variations undoubtedly give individuality to the action, so that, to a measurable degree, the adage that trotters go in all styles and shapes is true. But that all the greatest sires and the swiftest performers—with such rare exceptions as only to enforce the rule, exceptions that can be scientifically accounted for, on the fact that the trotting type, although rapidly formulating, has not yet been completely evolved—have the "trotting pitch" actual measurement will fully substantiate.

When, on page 72 of the same treatise, Mr. Wallace contended that "there "is an immense amount of ill-requited "zeal in attempting to infuse the blood "of the race horse into the trotter," and he furthermore, prophesied that "if we "make our calculations for great speed "(upon that infusion), ten to one we will "be disappointed, in the first generation, "at least," no one believed that within a decade Govenor Stanford would demonstrate that the infusion of thoroughbred blood into the trotter is not over-jealous foolishness, but superlative wisdom.

Instead of being disappointed in the first generation, that very cross has produced the champion trotting stallion in turf animals. When two years later, in 1876, Mr. H. T. Helm began the publication of his scholarly volume on "Trotting Stallions," and based his theory of trotting excellence upon the positive relationship of certain anatomical proportions in the propelling muscles, in the opening chapter, he contended that: "the strictly thoroughbred mares, from "the rigid and fixed caste of their blood, "refused to yield to the Bellfounder "element in Hambletonian, and do not "cross well with any of his sons."

Yet in the lifetime of this great expounder of trotting extremities, Governor Stanford has proven that, of all trotting types, the Hambletonian is the most valuable to cross with thoroughbreds of all the families, and that one of his sons, Electioneer, has been more successful than any other trotting sire, of all the other trotting families in the harem of pure blooded broodmares.

GONE TO THE BONEYARD.

BY A.

HEARING of an accident that had proved fatal to a celebrated and favorite horse (whose name may here be given as Cæsar) we hurried to his stable. We were too late. The stable had that awful emptiness that always impresses one with the sore feeling of the severing forever from a former constant friend. The colored attendant, sad at heart, was engaged in arranging our deceased friend's stall.

"Where is Cæsar, Tom?"

"Why, sah, he's gone to de boneya'd, these many hours, sah."

"Couldn't I get a shoe of the old fellow, Tom?"

"A shoe, sah? No, sah! Maaster had 'em all took off, so keareful—nails an' all. He's goin' to have 'em golded over, with real gold. No, sah, money would not buy one."

I parted with the faithful Tom. I did not think till too late of following Cæsar to "de boneya'd," and securing a hoof, which would have made such a splendid memento of the old horse.

Such incident as the above has often set us all a thinking no doubt what becomes of the remains of our once faithful friends—that have necessarily to be disposed of in some way, and the way found for them to "the boneyard." Curiosity

Digitized by Google

prompted us to an enquiry into this path of posthumous horse knowledge. The results seem to us to repay our trouble.

"Imperial Cæsar....": but a new rendering has to be given to the rest of it. There are now nobler voids to "stop" since that fatal day. The clay *does* now "melt and dissolve itself," by the renderer's arts, and many a curious process and constant change into innumerable new claimants on our attention, obtaining thus new exits and entrances on the new stage, in such guises playing, o'er again, not one but many different parts in social economic use and range. It will be admitted of what infinite resource and use our deceased equines are: and we may learn to become reconciled to the grewsome-like fate that always seems to await their dissolution.

Instead of perpetrating the old phrases "gone to pot," "gone to the dogs and to glue," etc., we will vote all these as obsolete. We shall find that the equine clay is the "starting point" of many new artful and eventful careers. The horse has indeed proven a valued subject in the economy of human material affairs from the earliest periods.

Early "Uses" of the Horse.—In early times the horse was solely an animal of the chase. It supplied flesh, drink, and dress. Many other parts were also variously utilized. The horse was a sacred animal among many nations. The early Germans after the sacrifice of their sacred horses cut off the heads and fixed them over the cattle stalls, or about the house, or in some sacred grove, as acceptable offerings to their gods. In the more retired districts of Glamorganshire, England, it was a custom to carry the horse's head round the county at Christmas time, accompanied by singing and merriment.

The Mongols and Kirghis to-day make articles of dress of horse or colt leather. Some Tartar tribes are experts in plaiting leather for various uses. They also obtained their thongs from the hide. From the hair they made ropes and sieves. In early Britain the hide of the horse was used in making the curraghs or primitive boats. Later the harness was made of ropes of hemp and horsehair. Among primitive races of the present time, where the horse has been introduced and become wild, it is similarly and variously utilized.

The Sarmatians drank the blood of horses mixed with the milk of sheep. The Concanians, Spaniards or Thracians drank it "straight." The Patagonians, in the newer world, live "on" the flesh of the horse. They almost entirely live "in" the saddle and when they die they are laid in a tomb with the stuffed skins of their favorite equines set up around their own remains. Even so long ago as Sir Walter Raleigh's time, the South American Indians killed the wild horse merely for their skins, which Sir Walter described as being beautifully marked and spotted with various uncommon colors.

The Science of the Utilization of Waste.—In these days the science of the utilization of waste has become so marvelously developed and appliances used for such purpose so perfected that every part of the animal—excepting the dying groan or "squeal"—hair, skin, flesh, bones, hoofs, irons, everything, from the topknot to the shoe-nails, is used at a profit. Every new application of art or science finds further uses for each part, and makes the dead animal of greater value. Healthy or diseased, there is no part that is not capable of being turned to account. In this after state the thousand-guinea thoroughbred does not fetch so much as the scavenger's dump-cart horse that has been engaged all his years conveying slush.

We shall now endeavor to show in what divers manners the disintegrated form of our once living friend re-enters the "social swim," and everywhere receives an envious welcome.

When the carcass reaches the "boneyard" it is divested of the hair of the mane and tail. The hide and the shoes are also removed. It is then cut up into portions of various dimensions. If the carcass is wholesome and if there is any demand for the flesh, such parts are selected for that market. If there is no such demand it all "goes to pot"—more scientifically known as the rendering tank.

"*Chevaline.*"—This is the name by which the edible portions of the animal has become known. The flesh portion of the horse, as has been shown, is a very common article of food in Euro-

Digitized by Google

pean countries. But for the incident of an early papal bull, we ourselves might have been of the hippophagist order described by Herodotus. In Poland and Russia herds of horses are still kept like deer, solely for the chase. In China horses are scarcely made use of except to be fattened and eaten.

In Russia, during the present famine, millions of horses have been sacrificed to provide food for the starving. Berlin consumed 6,099 horses; and Paris 21,291 horses, 229 donkeys and 40 mules last year. It is calculated that at the present moment horseflesh is a staple article of food in one out of every three households in Paris.

In America there is no law for horse eaters. But last winter in the west and east the daily press frequently reported "outbreaks" of the non-legalized practice. In Chicago the meat was good to all appearances, and looked so much like beef that the veterinarians could not tell it till they examined the bones. A butcher prided himself on his ability to tell any kind of meat placed before him. A certain *restaurateur*, however, seems, as the reporter remarks, to have "got a horse on" this self-confident expert. A dish was placed before him and he discussed it favorably, though remarking that it could not have been taken from the tenderest part of the beast. On being pressed to state what it was and whence it came, he replied: "It is a cut of roast from a steer's neck." On being informed that it was a steak from the caterer's own famous fat pony, though taken rather aback, he only expressed surprise that it should be so "familiar in flavor" to good bovine meat.

Speaking of the mess at Shoeburyness in his time, Capt. C. W. Bellairs, R. A., mentions a scientific *gourmet* who had established among the officers a taste for "sanitative gastronomy," his many talents, including "the appetizing of a Crimean mule steak or fillet of shot siege-train battery nag." Blaine (*Rural Sports*) avers that the flesh of a young colt is not inferior in texture to that of good beef. We doubt it not.

After a personal experience of ten years and a number of observations collected from others, M. Decroix affirms that we may eat with impunity the flesh cooked—not putrid—of any of the domestic animals, no matter what they have died of—glanders, typhus, or hydrophobia. M. Decroix after all this extraordinary experience, is still alive—a septuagenarian. He was present at the late banquet of hippophagists in Paris, presided over by M. Besancon of the prefecture of police, where he declared he was proud to have given the poor food fifty per cent cheaper than butcher meat. He remarked it was at the instance of his wife that the first shop for the sale of horse flesh was opened.

The Samoides eat the putrid relics of horses, as do the Auracanese, Siamese and Formosans, and continue healthy.

In "Omoo," a romance by Melville, one of the two great American marine novelists, the author alludes to the ship Julia's provisions. Of the beef, the cook in the story tells of a horse's hoof with a shoe attached, having been fished up out of the pickle of one of the beef casks.

Mr. Wentworth L. Scott, at a meeting of the Society of Arts, held in London, March, 1868, exhibited a specimen of *extractum carnis* prepared from horse flesh.

The Flesh Used for Feeding Many Animals.—Any one who has lived in certain localities of London must have become familiar with one of the peculiar industries of that city. Every morning, as true as the clock, the quiet is broken by a curious suggestive cry, which is apparently waited for, as it is certainly known in cat-and-dog life. It is the cry of the dog's and cat's meat man: "Ca' me-eet, dog's me-yet—Ca' or do-args' me-a-yet, me-a-t, me-yett!" There is, immediately, quite a commotion of reciprocative demonstration on the part of the pets and leaders of canine and feline society. There is a song of "Cats' Meat Nan" that is very amusing, preserved in Charles Hindley's volume on "Cries of London Town." One verse runs:

> Here's famous meat, all lean, no fat—
> No better in Great Britain!
> Come buy a pen'orth for your cat,
> A happ'orth for your kitten.

The song goes on to deplore the hard lot of the lady merchant: "It arn't any easy job to live by sellin' liver."

Digitized by Google

The merchant transports his goods in a wheelbarrow. The choice pale-colored little "cuts" are fixed by skewers and hung across the barrow. The sight is one not to be forgotten. An immense trade is carried on in this, and a great number of persons are engaged in it. The meat is obtained at "the knackers' yards." The most famous of these is Jack Atcheler's, in Maiden Lane, near the Islington cattle lairs. Passing by, one gets only a glimpse of the entrance, at the head of a long, remarkably well-kept alleyway. More than one fortune has been made there. The knacker, which word, curiously, was also once applied to a "cart-horse" collar or harness maker, and also to "an old worn-out horse," is a dealer in old horses, and also dead carcasses. When the former are by accident, disease or decrepitude a further burden on themselves and humanity they receive the *coup de grace* at the hands of the knacker or horse slaughterer. His is a most profitable business. As soon as a horse gets into the knacker's hands it at once increases in value.

Horse flesh, besides being good for man, cat and dog, is also used in feeding poultry—chopped up and boiled in their feed. We learn, however, on the best authority that "Spratt's" contains no horse meat. The meat in this article is composed entirely of "the best meat in Great Britain"—of course.

The "larder" of the royal kennels at Ascot is a "ward" where broken-down horses, condemned and seized by the police, are sent, to wait their turn to feed the royal buckhounds.

The carnivores in our parks and menageries are given to understand that the horse is "their meat."

The Parisians have long utilized the swarms of rats in a curious and profitable way. There is a common pound in the city, in the enclosure of which, surrounded by a wall, the carcasses of dead horses are lodged, after having been skinned. These are used as baits for the rats, which, in the course of a single night eat them to the bones, so that nothing is left but polished skeletons in the morning. But as may be supposed the rats, thus supplied so bountifully with food, increase amazingly, and the colony every three months has to be partially destroyed. When the *battue* is made, the ground is thus prepared: Horizontal and cylindrical holes are bored, all around, in and at the foot of the enclosing walls, the length and thickness of the rats' bodies. On the occasion of the *battue*, a great noise is made, and the rats, in great fear, rush into the holes. Those which rush into the wall holes, which are deep enough only to hide their bodies, but let their tails hang out, are immediately seized by these appendages, and lifted into the collecting bag of the operator. Hundreds of thousands are captured on such occasions..

The chief value of the rat consists in its skin, which is vastly more delicate than that of the kid. Hence it is largely used for the manufacture of "undressed" kid gloves. The lady as she pulls on her Parisian gloves admiring the excellence of the fit, little wots that she is encasing her delicate digits in the skin of an animal the very sight of which, in life, would drive her into hysterics. But such is the fact for which our deceased friend the horse is there responsible. One of these pounds is at Montfaucon, where a score or more horses may be seen daily tied up in rows waiting their doom.

Sometimes even another use is found for the waste flesh. It is allowed to decompose with the intent of breeding maggots therein. The maggots are then, when properly fat, gathered, and are highly prized as pheasant food. "And so *ad infinitum*."

The Process of Rendering.—If there is no demand for the flesh, the body, divided into portions of various sizes, is transferred to the rendering tanks. These are filled, to which the steam is conveyed by pipes. The meat is steamed for nine hours. The covers being then removed, the oil is collected, cooled, strained and put into barrels ready for market. This oil is equal to any for lubricating purposes, except, perhaps, the best fish oils. It is also used in soap and candle works.

The steaming process completed, the water is let out of the tanks, the residuum of bones and other fibrous matter being thrown out on the platform, where it is raked over. By this means the large,

Digitized by Google

hard bones are separated from the small, soft ones. The hoofs are then picked out. The shoes have already, perhaps, been removed to be sold as old iron. The shoeless hoofs go to the combmakers, who work up the suitable portions. The scrap remains of this process are destined for the glue maker. When the large bones are seasoned, they are ground into fertilizer.

The softer bones, with the pulp, are placed in sheds, where they lie for a period and are treated with sulphuric acid and other chemicals. They are then spread out to dry. When thoroughly free of moisture they are ground to a coarse powder and packed in barrels and sacks for transportation.

The flesh having been completely separated from the bones, which are rendered beautifully white, is shoveled and spread out widely on a platform to dry. On becoming thoroughly dry, the mass is sacked and carted to the chemist. He converts it into prussiate of potash and that into Prussian blue.

In Lyons, France, and elsewhere, whole carcasses are boiled and transformed into a pulpy consistence—mixed with bone dust, animal charcoal, ashes, gypsum—dried and powdered. In this condition it contains seventy-eight per cent of nitrogen, and must be considered good fertilizer.

Next to Peruvian guano the fertilizer manufactured from horse carcasses is the best on the market.

In Australia there are millions of wild bush horses or "brumbies" as they are called. They are sold sometimes as low as 10 cents each out of the pound, and, being so cheap, are boiled down for the oil.

In rendering establishments the entrails, remnants and refuse are fed to hogs in America and to cats and dogs in France.

Stable "Refuse," too, Acceptable.—In Persia the bedding of the horse consists of his dung. After being exposed to the drying influence of the sun during the day it becomes pulverized, and, in that state is nightly spread under him. It is the usual flooring of the stable and of the tent. The united influence of the sun and air deprives it of all unpleasant odor, and when from use it becomes a second time offensive it is again exposed to the sun and all unpleasant smell once more taken away. But, perhaps, the most remarkable transformation in any connection has now to be mentioned. The following is the latest: "The writer has just been shown samples of cardboard made from stable manure! It was of good quality, firm and tough. The remainder of the manure, aside from the water and the material that went to make the cardboard was contained in a small bottle. When mixed with plaster it makes a good chemical fertilizer. It is indeed a curious state of affairs when we find chemical fertilizer as a waste product from the manufacture of paper from stable manure."

Other Soft Parts.—The intestines are used as coverings for sausages and the like, particularly appropriate in the *saucissons de Lyons*, notoriously manufactured from the flesh of equines. The destination of the heart, tongue and liver belongs to that large class of popular mysteries that surround the composition of kitchen stuff. *Sausage* might be a guess not far wide of the mark. The blood is used by the sugar refiner, or sent in the direction of the fertilizer heap, where goes the other refuse of the knackery. It may be utilized in the manufacture of prussiates. In Sweden, where horse flesh is much relished, horse blood may be used in the making of a peculiar sort of bread affected in certain towns of that country—composed of a mixture of blood and flour. It is drunk by some people, and also used by fatteners of poultry.

The gut-strings are used by turners and grinders and also for cleaning cotton. The bladders, etc., are also carefully dried for various uses.

Horse Leather.—There is nothing like leather; and we find that the horse's hide is valuable for multitudinous purposes. The hides of the horse, ass, zebra and quagga have become important raw materials of leather. The Rio Grande de Sol exported 10.714 pieces, salted and 601 dried, in 1879. In London the approximate values are: English 9d to 1s 2d a pound; River Platte 6s to 21s each.

Horse hides are treated like calf skins. As they, with the exception of a part

Digitized by Google

near the rump, produce a thin leather, it is usual to cut out what is called the butt, which is tanned separately, and frequently used as inferior sole leather.

Horse hides are frequently subjected to a process of bate shaving, by which the stout parts are reduced, so that the complete infiltration of tanning may ensue.

Horses are not troubled with the warble-fly, as cattle are. Hence their hides are free from the riddling made by these pests in the skins of the latter, which causes a marked depreciation in the value of many of their hides.

Horse hides have been tanned in this country for nearly twenty years. Newark, N. J., is the principal location of the industry. "The hides are washed, limed, handled and unhaired, similarly to other hides intended for upper leather stock. The sides, after being unhaired, are put in clean water over night, then green shaved and put in a bate of hen manure four or five days. The bate is worked out; they are handled in liquor six or seven days, then laid away in ground barks; each layaway extends over about seven weeks. They are tanned six to eight months, and are hung in the air to harden, then dampened and split. The sides are flattened and leveled by the currier. In finishing, they are scoured and stuffed, set out, whitened and finished by machines, and blacked with soap blacking or other compounds. Two pieces on the rump of the horse hide are known as the shell. After the hide is through the lime, this shell is cut out and tanned separately, as it requires different treatment and makes finer leather than the other portion. It is finished on the flesh side, while the rest of the hide is finished on the grain."—(*Isaac H. Bailey.*)

In Lybia and Numidia the natives were in the habit of taking the wild ass, not only upon account of its flesh, which they esteemed as delicious eating, but for their skins, of which that kind of leather is made called *shagreen*. Shagreen is also prepared in Russia from the skins of horses, asses and camels, without tanning, and grained so as to be covered with small round pimples or granulations. This characteristic surface is produced by pressing small seeds into the grain or hair side when moist, and afterward when dry, scraping off the roughness left by them; then, by soaking, causing the portions of the substance of the skin which has been compressed or indented by the seeds to swell up into relief. It is used for covering small cases and boxes. This word, *shagreen*, is worth a passing notice. It traces to the Turkish and Persian *sagri*, meaning the back of a horse or other beast of burden; thence to the leather of a horse's back; thence also applied to a rough fish skin used for graters and files. Hence, figuratively, it came to be used for a gnawing, corroding grief, vexation, etc.

We learn from Chaucer and other early English writers that "costliest cordovan" was a luxurious shoe-leather. Cordovan was a leather that originally came from Cordova in Spain, from which we have the word *cordwainer*, or shoemaker, or worker in leather. It was sometimes goat skin, tanned and dressed, but more frequently split horse-hide. Thus it was used for the uppers of ladies' and gentlemen's shoes. Cordovan was soon produced in Britain and became therefore not so "costly." It makes a very agreeable, easy, high-polishing leather. Sometimes shoes made of cordovan are mistaken for kangaroo. The lighter kinds of horse hides are also japanned for special purposes, etc.

A ballad of date 1611 describes the metamorphosis which Scotsmen were supposed—by the jealous—to undergo after migration to England:

Thy shoes on thy feet, whenst thou camest from the plough,
Were made from the hide of an old Scot's cow;
But now they are turned to a rare Spanish leather
And decked with roses altogether.

Jamieson, the Scottish lexicographer, defines Cordovan as "sealskin or horse-skin used as leather," and was manufactured in Scotland at a later date to that of the ballad.

The Gauchos of the pampas made themselves boots of a singular make: "They are formed of the hair and part of the leg-skin of a colt taken reeking from the mother, which is said to be sacrificed for the sole purpose, just at the time of bearing, when the hair has not begun to grow. At this stage the skin

Digitized by Google

strips off easily, and is very white and beautiful in texture and appearance. The ham forms the calf of the boot; the hock easily adapts itself to the heel, and the leg above the fetlock constitutes the foot; the whole making a neat and elegant half-boot, with an aperture sufficient for the great toe to project through."

In 1681, in Scotland, a favorite mode of decoration for the interior walls of the more pretentious dwellings or castles was leather stamped and gilded in elegant designs, which produced a particularly rich effect, like that of *papier mache* of later times.

Mr. Astley Jr., of the famous amphitheater of that name in London, had a Barbary horse presented to him by the duke of Leeds, which was a most remarkable performer. He was so famous that when he died his hide was made into a thunder drum, which to this day stands on the prompter's side of the theater.

In the museum at Brussels, in 1817, was placed the stuffed skin of the horse belonging to one of the Alberts, who governed the low countries in the time of the Spaniards. It was shot under him in the field, and the holes made in the thorax by the musket bullets are still very evident.

In these days horses' hides are found particularly valuable for the covering of board-room or office tables, and also other parts of furniture.

In Philadelphia they are also put to a "national" use. In that city 100 horses' hides are used each week in the manufacture of base-balls. In this we may agree that the horse's hide has attained its most perfect sphere.

The "pieces that remain" are even collected and treated in several countries in different ways. In Berlin paper has been made from such "waste." A material which might be called "shoddy" leather is also manufactured, which is used for insoles of shoes, etc. Treated with gutta-percha it forms a waterproof material of no mean value.

The Hair.—The total import of horse hair into London, 1879, was 19,582 cwt. (of 112 lbs.), value £114,946. The hair from healthy, vigorous animals from South America is put up into large bales of half a ton and bound with hoop-iron after being subjected to hydraulic pressure.

Horse hair is used in an infinite number of ways. Long hair is woven into cloth, stiff petticoats, straining and crushing bags, clothes, stockings and gloves, plumes, wigs, fishing lines and ropes. Short hair is used curled for stuffing seats, mattresses, saddles, and sometimes made into a cheap manure; medium-short for brushes, sieves, ornamental damask haircloth, etc.

The first process in dealing with long hair is sorting. The different colored hairs are placed in separate heaps. This is done to facilitate the process of dyeing. Next it is "hackled," that is, made straight and deprived of all foreign substances, care being taken not to break the hair. Then it is carded or combed, and assorted into lengths. It then undergoes various other processes of twisting into ropes and curling, making it ready for weaving.

The manufacture of horse hair into cloth originated in England early in the century, from whence it was carried to France and America. The total yearly output is 20,000,000 yards, of which America's share is 600,000 yards.

The hair must be sixteen inches in length for weaving purposes. Special looms had to be invented to compete with Britain. As usual, America came to the front with improved methods, and shows that at manufacturing she can compete with the world, when she makes up her mind to do so.

The lighter hair is limited. It is dyed in fancy colors. The blacks and grays are easier to dye black. Permanent brilliance of color depends on the nature of the web, which may be either cotton, linen or worsted. Some remarkably beautiful samples of the art are to be seen in the Bethnal Green branch of the South Kensington Museum. All colors and patterns of damask cloth from the hair of the horse are to be there seen. The article is usually manufactured into length 14–32 inches wide. It sells for a dollar a yard, or more.

Formerly hair seating was woven by hand, every hair being inserted singly. Horse-hair fabrics were often mixed.

Digitized by Google

They were sold cheaper, not being so durable as the whole-hair manufacture.

The preservation of the combings of horses' tails and manes is an object among the rural horsemen abroad. Sometimes they even trim out by pulling the longer hair, if they are laxly looked after. Periodically the "peddlar man" comes around and exchanges the hair for various commodities. The collection of horses' hair of this kind is such an object that systematic robberies of stables have been executed, the amounts stolen from each averaging only a few ounces in weight. Convictions have frequently been secured of those having such a fancy for horses' hair.

The true crinoline petticoat was made of horses' hair. Indeed it so derived its name from the French *crin*—hair. But in this absurd article of obsolete adornment, steel, whalebone, wadding, rattan cane and buckram superseded the horse hair. Shirts were formerly woven of horses' hair to be worn for the health of the soul; now gloves of the same material are used for the health of the body.

Our ancestors not only shaved their faces, but their polls, substituting an artificial covering of horses' hair (sometimes it was goat's hair) called a peruke for the natural covering which they had removed. A queu or tail of horses' hair suspended at the end of a pike, terminated by a gilded pennant, is the emblem of authority of a Turkish pasha of the third rank. Those of the second and third ranks have two and one tails, respectively. The plumes on the helmets of cavalrymen are of horsehair.

The duchess of Wellington had bracelets plaited from the hair of the celebrated thoroughbred Copenhagen, on whom the Iron Duke was mounted throughout the battles of Vittoria and Waterloo. This "well renowned" horse was a famous celebrity at Strathfieldsaye, being the particular pet of the duchess, who fed him bread from her hand. He had a military funeral after dying full of years and honors. There were many who would have wished to have secured his skin or skeleton to mount after his death. But the duke resisted all attempts to give his faithful friend up to such a purpose, and he provided that he should die a natural death.

The fearless cragsmen of St. Kilda, one of the outer Hebredian islands, whose chief occupation is the snaring of various species of sea fowl for their oil and feathers, catch the birds with gins made of horses' hair. These are tied to the end of their fishing rods, with which the fowlers creep among the rocks indiscernably, pulling the noose over the heads of the fowls' necks, and so draw them instantly. They use, likewise, hair-gins, which they set upon plain rocks, both the ends fastened by a stone. The ropes by which these daring men let themselves down over the beetling crags are sometimes made of horses' hair, nine to ten fathoms in length. These are less costly than the strong, raw cowhide salted for the purpose, and which are more suitable for the less accessible places. Recently these horse ropes, tightly twisted, were enclosed within cases of salted cow's hide.

Sometimes the fine flowing tails of well provided horses have been utilized, it is alleged, to adorn the docks of others deficient of the beauty thereunto belonging. It has been actually whispered that the famous cream white ponies belonging to Queen Victoria that occasionally take part in the parade on state occasions owe their magnificence in such particular to the assistance hinted at. Such must, surely, be a false tale.

The uses to which horses' hair can be put are not yet exhausted, the line,

> Swift rides the rosin o'er the horse's hair.

proves another claim the noble equine has on our constant appreciation—often promoting lively motion from us.

Fishing lines are also made of horses' hair. This at once suggests the legend according to which, if the long hair of a stallion was dropped into corrupted water it would turn to an eel-like animal. Hollinshed, the great old chronicler, recorded this interesting fact. He said: "A horse hair laid in a pailfull of turbid water will, in a short time, stir and become a living creature." This, we are concerned to add, has been set down by later and even serious writers as preposterous, "and foolish notion." These later naturalists won't receive such a long

established "fact." They inform us that the creature believed to have been so developed was a Nematode (with a long name). But what became of the hair, its occupation being gone? Shakspeare alluded to this belief in *Antony and Cleopatra.*

Much is breeding,
Which like the courser's hair hath yet but life
And not a serpent's poison.

Bones are important agents in many manufactures. They are used by potters, turners, cutlers, glass-workers, sugar refiners, assayers and farmers. Horse bones, especially the cannon bones, ought, one would suppose, to be superior to those of the ox; how frequently do we not read of the bones of the former being "like ivory." The shank bones may be used for knife handles, spoons, tooth and nail brushes, combs, fans and buttons. For the latter purpose bone can compete with wood.

As a chief constituent of bones is phosphorous they may find their regenerated use in producing lucifer matches. Carbonized as charcoal, or transformed into ash, they are useful in the arts. The parts too fine become the bone black of the blacking makers. The *sal volatile* that is often so useful in the church pew may have traced its origin to the horse or a near relative of the same, that once brought the pew occupants to the church door.

When not otherwise serviceable, the bones are crushed into dust for the farmers. Says Spon: "Horse bones contain so little fat as not to be worth boiling for extraction of grease. They are comparatively useless for any purpose save manuring the ground. They are only indifferently valuable in that, as the great per cent of lime they contain precludes their being economically treated with sulphuric acid before application to the soil." But "horse bones are as good as any other bones," says E. Lankester, F. R. S., so we may be reassured.

"It is said that at the mills the bones of Clydesdale horses are readily distinguished from those of ordinary horses, by their elasticity, toughness and solidity."

Horses' teeth have been put to a curious use. In the Gibbs bequest, at the South Kensington Museum of Science and Art, there is a set of fifty-three draught men, manufactured from such material. The date of their manufacture belongs to the Anglo-Saxon period. In the folk-lore of animals, horses' teeth "were a safeguard against toothache."

We may allude here to the use of the whole skeleton—not to mention the disposition of the body as a "subject" in veterinary anatomical class-rooms—as permanent objects of interest and instruction in museums. A horse, the property of a laborer of Arbrouth, is believed to have drawn the entire materials for the Bell Rock lighthouse, built by Robert Stevenson. The animal became a pensioner and died in 1813. Dr. John Barclay, the celebrated anatomist, had its bones collected and set up in his museum, now the property of the Royal College of Surgeons, Edinburgh, where the skeleton of "The Bell Rock Horse" may yet be seen.

The skeleton of Eclipse, necessarily minus "a foot," is still on view at Cannons, while Smetanska, the progenitor of the Orloff trotters, is preserved in the museum of the Orloff family, in Russia, to this day. The ashes of Hambletonian, however, and many another equine celebrity, rest under the green sod, it having been preferred in these instances, after the death of the animal, to "bury him with his skin, and no flaw or abuse of any kind."

Gelatine and Glue.—Gelatine is obtained by boiling the connective tissue, tendons and green bones, also from dried bones by dissolving out the earthy matters by means of hydrochloric acid and boiling the residue with water. It swells up in water and dissolves on boiling to a viscid liquid which gelatinizes on cooling. Size and glue are impure forms of gelatine. Chondrin is obtained from the cartilages of ribs, etc.

The bulk of the skin by boiling contains gelatine. The hide contains albumen. Keratin is obtained from horn, hoof or hair epidermal tissues, also from epithelial glands, etc.

The skin of the wild ass is used for making a gelatine, which, scented with musk, is prescribed in chest diseases. It is sold in flat, rectangular reddish pieces,

Digitized by Google

translucid. Like all their substances of great value, the Chinese, who manufacture this article, wrap each piece in a paper of vermillion color.

Glue is a crude gelatine. Almost every animal substance will yield it. Hence all kinds of animal refuse is welcome to the glue makers. Such refuse include clippings of hide, hoofs, ears and tails, and all parts of hair-covered integument that can be treated with lime to get rid of the hair. The best glues on the market are manufactured in Scotland, according to the authorities on the subject.

It is possible out of the old leather in the cordovan uppers of our worn-out shoes to manufacture jellies as used by pastry cooks and delicate invalids. This has actually been done, and the "raw material" and the manufactured product exhibited side by side at a meeting of the New York Liberal Club.

Cosmetics are indebted to gelatine, as are also bon bon wrappers. The manufacturer of gelatine asks no annoying questions whence the materials offered him are derived. The tendons of a worn-out horse, with the dust of the old bones to which they were attached, may become converted by him into the most delicious jellies to tempt the palate of the weak and invalided that once pulled the reins on the animals from whence these delicacies were derived. These jellies, though not nutritious, are easily digestible.

Gelatine is also now prominently used for making elastic molds for reproducing with accuracy and in a single piece elaborate sculptured objects of exquisite finish and delicacy.

The Hoof.—The hoof of the horse is popularly supposed to be the principal "raw material" source of glue. This idea is not correct. The real utility of the hoofs is in making prussiates of potash, and in case-hardening iron. Leather clippings and the parings of horses' hoofs are also used in making blue dyes, in which process the old shoe iron may also take part. The hoof finds a use, too, in making buttons and snuff boxes.

The hoof itself may be formed into beautiful ornaments—inkstands, or pincushions. Many an old friend's memory is thus preserved. The hoofs of the identical horse that Lord Cardigan rode in the charge of the light brigade were preserved and prepared as ornaments. One of these is in the possession of the Prince of Wales. Another belongs to the officers of the famous regiment to which the animal was attached. It is by them brought out at mess on state occasions. The Countess of Cardigan owns the third. The fourth, which is the off hind hoof, graces the sideboard of Sir James Sawyer, the well-known Birmingham physician. William IV. presented the hoof of Eclipse, mounted, to the jockey club, as a challenge prize. It was run for at Ascot, in 1832, being carried off by Lord Chesterfield's Priam. Strangely, it is said, it was not regarded with due veneration, and it is now not known what has become of it. A figure of it is presented in Blaine's "Rural Sports."

A polished and shod hoof, mounted so as to seem a snuff box, is the property of the Guards' Club. This ornament bears the proud inscription: "Hoof of MARENGO, rare charger of Napoleon; ridden by him at Marengo, Austerlitz, Jena, Wagram, in the campaign of Russia, and lastly at Waterloo." On the margin of the silver shoe is to be read: "Marengo was wounded in the near hip at Waterloo, when his great master was on him, in the hollow road in advance of the French position. He had been frequently wounded in other battles."

Rowland Ward, the great London furrier, is an expert in preparing and mounting such objects of interest. He has, indeed, published a treatise on the subject.

Under this heading we may mention the following: "Horses' spurs," the callosities on the inner sides of the legs of horses—presumably the salendars and malendars of Youatt and others—were used therapeutically. "A cancer in the breast. . . . Take horses' spurs and dry them by the fire till they will beat to a powder; sift, and infuse two drachms in two quarts of ale; drink half a pint every six hours, new milk, warm. It has cured many." So declared John Wesley, in "Primitive Physic," 1755.

Old Iron for New Shoes, and Gun Barrels.—Everyone acquainted with the

Digitized by Google

economy of the smithy knows the value placed on old shoes. These are made over into new iron for new shoes. The battering and hammering the old shoes received on the roads and over the streets renders them particularly tough in fiber. So much appreciated is this that old shoes and nails have long been especially valued as furnishing a peculiarly tough iron, used for making the famous stub-twist of the barrels of rifles. Stub-twist consists of spirally welded ribbons of steel and iron combined. Stub-nails are worn-out nails, and are utilized for the same purpose.

The demand for horseshoes for other purposes bids fair always to exist. The junk dealers find it not unprofitable to keep horseshoes in stock for sale to dwellers in tenement houses, where a horseshoe over the door for luck is common. If all the money-drawers of small shops could be rummaged, "a sufficient number of shoes could be found to iron most of the equines in town." The superstition is that the shop will do a good business so long as the presence of the shoe is known only to the owner. On a rare occasion, even on the dirtiest of days, a daintily dressed lady may be discovered gingerly picking her way through the mud and mire of the streets of the city. Suddenly she will stop, stare and stoop. She has "come across" a horseshoe. She picks it up, dirty as it is, and tucks it carefully away in the mysterious depths of her mackintosh, while she proceeds smilingly on her way. She has acquired the necessary talisman "for luck." This luck is brought about by keeping the witches (that never bode any good) away. For these purposes the shoe must be an old one and have been picked up accidentally. It is nailed up in a particular way, which we can not divulge, over the entrance door.

In John Clare's "Shepherd's calendar" the following reference occurs:

> On corner walls, a glittering row,
> Hang fire-irons—less for use than show;
> With horseshoe brightened as a spell,
> Witchcraft's evil powers to quell.

A horse's hoof under a child's pillow was a "preservative from convulsions."

The horseshoe with its nails complete makes a handsome desk ornament, as a pen-holder. Either polished clean or gilded over, it has a substantial look and indicates the "racy" sympathies of the owner. Horse shoenails themselves, gilded and studded with diamonds are the very latest idea in scarf-pins.

The Tallow.—Tallow is chiefly obtained from the fat of animals, the latter being first rendered, as it is technically called —that is, as we have shown, separated from the membraneous matter with which it is associated in the form of suet.

Horse grease or mares' grease, in immense quantities, is shipped from South America and Australia. It has about the same consistence as ordinary commercial lard; and has, practically, a like value for the purposes of the soap and candle-maker. Bones may sometimes yield grease on boiling, which is used by the same parties.

In France horse grease or fat is transformed into genuine "bears' grease." It is delicately perfumed, and put up and exported. In the apothecary stores, aye, in these very United States, it fetches exorbitant prices. In antithetical contrast to the above: the grease (raw material) may be less elaborately manipulated, and be consigned to the users of harness grease, or lamp oil. At Murrumbidgee, Victoria, Australia, in 1868, when boiling down horses was in the experimental stage, a breeder obtained fifteen gallons of pure oil from one fat horse. It sold for 6s 6d per gallon.

Tallow is now so intimately associated with "dairy products" that it was not a surprise to learn of the dairy inspector of Minnesota discovering lately at Kettle River a quantity of oleomargarine on the premises of the manufacturing company there. The inspector besides found that horse fat entered largely into the composition of the oleo. Indeed, this is not new. It has been alleged that the enormous quantities of butter imported to Britain from Holland were derived not entirely from the famous Dutch cows, but actually from the grease of "Flanders mares."

Milk Koumiss.—Having thus dropped onto dairy matters, it is quite in line to deal with milk. In this we, however, are not dealing with the dead subject, but with the living.

Digitized by Google

We include this item simply for completeness here. The Lithuanians were drinkers of mare's milk, a custom which though unknown to the Germans had spread from the horsemen of the southern Russian steppes to the Baltic. Herodotus gave the name of Hippamolgi to these mares'-milk drinkers. The Persian kings and nobles leave the mead to the poor, themselves drinking the milk of mares distilled. The Lithuanians and Iranians kept great herds of mares, which were driven together periodically to be milked. It required great practice and strength to milk them. They had often to be hobbled to accomplish the task, till they got accustomed to the handling. Cheese was also made from mares' milk.

The following modern method of preparing koumiss is that adopted at Bruck by Dr. Fleischman: Fresh mare's milk, whilst still warm, is mixed in wooden tubs with one-sixth or one-seventh of its volume of koumiss several weeks old, and covered over with cloths. The tubs are shaken up seven or eight times in twenty-four hours, at the end of which time the koumiss has fermented, and can be bottled up. Koumiss thus prepared, and four or five days old, is brisk and effervescent, has a peculiar but not unpleasant bouquet, and affects the palate like an effervescent wine. It is sold for medicinal purposes in Vienna at 2 fl. 50 kr. paper currency, a bottle. The milk is obtained from a small stud of Tartar mares belonging to Count Batthyany. The ferment required to start the manufacture of the koumiss was brought by the Tartars, who came with the mares in 1872. Each mare gives, on an average, two Austrian measures, or about half an English gallon of milk daily. On the steppes it is considered a specific for consumption. "Koumiss," a milk of cows, prepared in a similar way, may be obtained in this city as well as throughout the country.

One of Purchas' pilgrims described its manufacture as early as 1253, in Tartary and China. He calls it cosmos, and mentions that as many as 3,000 mares were kept on a single estate to furnish the superior article called caracosmos, or black cosmos, a beverage reserved for the nobility. The milk was poured into a bladder and shaken till it formed a sediment as thick as butter; the clear portion of the liquid was strained off, and formed a pleasant, slightly intoxicating drink. The lees or dregs were given to servants.

The koumiss of the steppes was prescribed to consumptives, who were also recommended to "the cold cure" of that region.

The milk of the ass, containing more sugar and caseine than that of the cow, has long been valued as a nutritious diet for persons of weak digestion. Mounterey Jephson says in his book on "Emin Pasha" that there are great herds of donkeys in the country east of the Dinkas, which the natives use only for milking, and not as beasts of burden. In India the potter and his family grow strong at the expense of the she-ass and its foal. The milk of the ass is prescribed by the faculty in cases exhibiting a tendency to phthisis.

M. Parrot, physician at the hospital for Assisted Children in Paris, introduced an altogether novel method of rearing children on asses' milk. His method was to allow them to draw the milk directly from the teats of the animals. The suckling babes are held in the arms of the nurses to the teats of the asses. The operation is performed with wonderful ease. Numbers speak eloquently of the success of the plan, especially in children afflicted with congenital or infectious diseases. Mares' milk, it is said, would be even better, being much nearer in chemical composition to "mothers' milk."

INCIDENTAL TRAINING FOR COLTS.

BY RAY MARSHALL.

Every owner of colts realizes that they need early handling. But few go farther than the feeling that one ought to be able to hire a careful expert to do this work. The possessor of only two youngsters will sigh for what ought to be their

Digitized by Google

care, not appreciating his own latent power and tact for this kind of thing.

This inference, of course, applies to the man who thinks more of his infant equines than just to remember their probable value in money. It includes every one who loves to have them about, and is ready to care freely for their physical wants—supplying food, shelter and thoughtful attention to the diet that will best promote a symmetrical conformation.

If the colt's home is on a farm and its dam must plow and do other field work, there is little to be learned by following about—its place is in a yard or pasture lot in company with an idle horse or some fellow colts. But when it has nourishment from the mother it is a valuable part of the colt's training to allow the harness to remain, when already on, that the straps, lines, etc., may impress the youth with their harmlessness. Before the first month of life is passed, the straps should be purposely dangled about, and brought in contact with every inch of the surface of the young limbs. This and other operations tending to acquaint with "the real varied life of a horse" should be repeated until our subject is made to endure the wrapping of straps or cords loosely about limbs, body and head, without resistance and without effort to kick or run out of them. This sort of handling includes the actual holding of the little fellow, daily with one's main strength, and conquering it for but a few moments at a time, before a week old; afterward hold less frequently until it ceases to struggle.

After one month old, put on a colt halter for a few minutes, three times a week, at first not tying. After a fortnight teach to lead beside the dam for a week, afterward tie in the stall by the dam morning and night, and teach to eat ground grain and bran, at first from the hand, adding a little sugar at times. If the milk supply is light, it is now a good age (eight or nine weeks) to add a quart of warm cow's milk with one-fourth the bulk increased by water. But up to this age the colt should never be tied more than an hour at one time, and, as a rule, but twice during twenty-four hours, while eating beside the mother. Some one, too, should be about the barn or in hearing distance, up to this age, while the colt is tied, to extricate in case of accident.

For the above work a systematic man needs not to devote more than ten minutes per day for forty days (of the first sixty of the colt's life), which is equal to less than seven hours' time. For the following four months no more time is necessary, and the youngster may be brought up to its independent life (after weaning) with less than three days' actual time devoted, incidentally, to the training. Shortsighted people, of course, who do not distinguish between training and "breaking," may see little value in such work.

At ten weeks of age the coming horse is capable of going away from home. This does not mean, however, that it should go continually with the dam. The latter if kept as a driver in the city, village or country, must travel in the aggregate a dozen or more miles per day. A chapter in the career of the colt is to be devoted to sightseeing. To see new objects and to learn that they are not at all terrible, it must be fresh and wide-awake. Hence the caution to not exhaust with continued leading about. When starting out for a drive one can consider whether the extent is a suitable trip for the pupil in the way of incidents, and whether there are in view any objects, such as stumps, large stones, clumps of shrubs, wild or domestic animals (not frequent sights at home), a stationary or traction engine, noisy machinery, etc. During the last five weary miles of the day's journey of ten miles, nothing would, as a rule, attract the colt's attention. But an ordinary drive not much exceeding a mile for every month's age, would not fatigue the little one seriously. The sights along the streets teach readily that there are numerous disagreeable looking things. The way the old matron goes right along in the midst of it all gives her pupil constant assurance that "things are not what they seem." A dozen miles' travel a week for three months led by the side of a sensible mother, or allowed occasionally to follow loose, if disposed to come along promptly, teaches more effectively at the period

Digitized by Google

from three to six months of age than when older. There will necessarily be a call for the exercise of some care in having a colt along. The absent-minded driver should always tie the colt to the harness where he will not fail to have it "ever present in view." He will be less lost to the world of life by this precaution. If the dam has a model gait at the walk or the trot, the short trips should engage the earnest effort of the youngster to imitate, and the thoughtful driver will study to adapt the pace of the elder to that of the younger.

It is not easy to anticipate all the "thousand and one" items that are to come under the gaze of the colt's first six months of life, but the idea to be impressed on the owner is that it is only by seeing and knowing through the several senses not once, but several times (scores of times in many cases) that the disposition to be frightened is to be eradicated. Good eyes and good sense will enable some to learn more readily than others. More important than all is it that confidence in the driver be firmly established. An assuring word on all occasions of hesitation will be of great value in cultivating the habit of caution which nature furnishes by means of instinct. Otherwise there might be danger of developing a listless, stupid trait of character which is positively a great detriment, if not fatal to even moderate usefulness in a trusty driver. The driver of experience with horses needs no printed program to guide his work in the incidental early lessons. The only probable lack in his construction is patience and "stick-to-itiveness." The colt has less than a score of years for life, as a rule, and it is urgently demanded of every breeder that the first year and a half be improved. A captain of war times told his chaplain that if his men approaching a conflict prayed, they must do it as they marched to battle. This sentiment is the key to the situation about the great majority of stables. If the colt has care, it must often come at odd spells as an incident of busy life, in small and irregular quantities. The prominent men of the world became such by turning to good account their spare moments of boyhood and youth. The good trusty horses may be made in the same manner. If the lives, comfort and happiness of busy men, frail women and trusting children are to be sacredly considered, more and more thought must be given to the coming horses.

PROBLEMS IN FARRIERY.

BY S. T. H.

Object Lessons.

Before continuing the subject of the weight-bearing portions of the foot, several importunate enquiries must be considered.

From the treasurer of Pocahontas County, Iowa, comes an instance of an exceedingly speedy horse, unbalanced by a complication of troubles:

I. He is "up-headed, and a very high knee actor," so much so that he sometimes cuts his left inside arm.

II. He stands quite straight on his front pasterns and toes in, but wings out with his right front foot.

III. He lands on his toes behind.

The owner desires to get rid of this high action and to lengthen the stride.

It will be noted that there is no complaint of forging at a slow gait, nor of speedy cutting when forced up to a 2:20 momentum, which his owner writes he is able to show in his trials, so that the relative length and height of the front and hind actions are in harmony. They should not, therefore, be unequally disturbed. If the one is lowered and lengthened, the other should be correspondingly changed, in order that no interference should take place. The action is balanced now, which is a rare feature of the trotting movement, so far as the freedom of the limbs and feet are concerned, and care must be taken that no change shall be made which will disturb this equilibrium.

This instance is an illustration of the

Digitized by Google

necessity of dressing the feet before any other remedial treatment is resorted to, so that the horse will stand as near straight upon all four feet as the structure of his limbs will permit. In all cases this is the primary necessity, because it must never be ignored that the horse lands upon his heels, revolves over the quarters, and springs from the toes. The ankle joints have only the forward and backward articulation, as the arm and stifle are the only ball-and-socket joints which permit of lateral as well as the forward action. If then the toes are straight, pointing neither outward nor inward, the ankle articulation will be in a line with the position of the feet. If the toes turn either in or out, the backward and forward articulation of the ankles will cause the feet to move in the air just as they stand upon the ground. Before anything else is done with this horse the axis of the right front foot must be brought into a straight line with the axis of the pastern. The owner says he toes in "with that foot at rest" and wings out in motion. In the farrier's phraseology he is pigeon-toed on the right front foot, which makes him a confirmed paddler with that one foot. How he can move free from interference with the action of that foot and limb so decidedly out of line is a mystery, for this defect often causes the striking of the flexor tendon of that limb, either with the shoe or with the toe of the hind hoof on the same side, in rapid action. If the tendon escapes, the outside branch of the front hoof or the outside quarter are either bruised or chafed sufficiently to make the horse lose confidence in his stride at full speed.

When the hoof "toes in" the inside branch of the hoof is invariably higher than the outside branch, provided the ankle is normal in shape and articulation. To explain the meaning of the terms, inside and outside branches of the hoof, take the cleft of the frog as the center or base line of measurement and project it forward until it strikes the wall. That will be the point of the toe. Now from this point to the outside heel will constitute the outside branch of the hoof, and from the same point to the inside heel will describe the inside branch of the hoof. Mechanically speaking, when the compass measures from this point of the toe to points equi-distant on the ground surface of the inside and outside branches of the wall, you have fixed points at which to take the height of the wall, from the lower margin to the coronet. In all cases of pigeon toe it will be found the outside branch is lower, unless there is a palpable malformation of the ankle, which rarely obtains. The outside branch may not prove to be uniformly lower all the way from the point of the toe to the heel. Sometimes the outside heel is alone too low, and, at other times, the forward arch of the outside quarter is abnormally lower. But the compass in all cases will invariably determine the place, which demonstrates the accuracy of this method of measurement over that of the unaided eye. But this pigeon toe is generally attended with another serious consequence, when the outside branches to the extreme heel is lower than the inside. The horse then lands upon the inside high heel first, which concentrates the concussion at that point and produces a bruise or extravasation of blood at the inside heel, commonly called a corn. Moreover the inner journals of the coffin, pastern and knee joints, all the way up the limb, are thus made to bear the first shock and preponderance of the concussion, much to their injury. For excess of friction means the excitation of inflammation, and consequent soreness that is at enmity with free, elastic movement.

As a general rule the wall in such cases can be brought to a level by beginning at the first outside toe nail and paring off the wall gradually to the inside heel. The eye will answer as a sufficient guide in the use of the knife, but the rasp will more accurately complete the operation when the compass detects the slightest difference in the heights of the quarters and heels. When they are thus made level the toe will stand straight, unless the ankle joint turns inwardly. In these instances, which are exceedingly rare, heroic treatment will admit of the compensation of either dressing the inside branch of the wall lower or forging the inner half of the shoe thinner than the outside. But this treatment need not be

Google

indefinitely continued, for after two or three shoeings the joint will be forced to a normal position. Thus this horse under consideration can be made to stand perfectly straight upon his front feet. Then it is time to work upon his other defects which demand a different grouping than the owner of the horse gives them.

For instance, he is upheaded, stands straight upon his front pasterns, has high knee action, and cuts his left inside arm.

The arm-cutting is an inevitable consequence of excessive knee action, upright pasterns, and a lofty carriage of the head, especially, in all cases, where the horse has speed enough, as in this instance, to trot quarters in thirty-five seconds.

The enquirer says nothing about the relative height of the heels with reference to the proper length of the toes. But, in all probability, the heels are permitted to grow too high, while the toes are unduly foreshortened. This may not be the fault of improper dressing of the hoof—the growth of the wall is not always normal. In some cases the heels grow with undue rapidity and strength, while the increase at the toe is exceedingly slow. But when the heels from any cause are high and the toes short, attended with a violent folding of the knee, arm striking generally results. In this case only the arm of the near fore limb is cut, but undoubtedly, the other arm is struck, though not bruised, for sometimes the shoe, and at other times the front part of the wall of the uplifted front foot comes in contact with the arm.

The treatment is always the same and the remedy rarely, if ever, fails. The heels must be lowered in order to lengthen the ground surface of the hoof; but the toes must never be foreshortened. On the contrary they must be allowed to extend to the full margin of the wall. If there is not sufficient ground surface to tax the flexor and extensor muscles so effectually that they can not exalt the action sufficiently high as to come in contact with the arms, then the web of the shoe should be drawn gradually thinner from the toe to the heel, making the heels as thin as the blade of an ordinary case knife. If this is not quite sufficient, then the toe of the shoe should project beyond the wall, at its forward arch. In all cases the shoe should be made as light as possible, and rather broad in the web, for weight in the shoe adds altitude to the action, and violence to the interference. Then the high head must be drawn down by the standing martingale, not enough to punish the horse, or to disturb the freedom of his muscular exertions, but sufficiently to draw the center of gravity far enough forward to relieve the hind parts, and to place an extra burden upon the front limbs. The high knee action, and the distressing arm-cutting will then disappear as if by magic. The upright front pasterns will gradually become more oblique, and the front action perceptibly lengthened. The side weight used can be discarded, for whatever benefit it may exert temporarily, only lasts till the muscles become accustomed to the extraordinary burden, and then they perform their functions, without reference to this mechanical appliance, which frequently produces irreparable injuries.

But the owner complains that his horse "lands on his toes behind, and will wear out a six-ounce plate in four weeks."

The wearing away of the toe of the shoe in four weeks is not excessive. Very few horses can wear a six-ounce plate behind for that length of time, especially if the track is sandy or they are subjected to occasional road work. The wearing away at the toe does not indicate landing upon the toes. On the contrary it marks the friction upon the toe when the upturned foot springs from the ground. The peculiar growth of the hind feet should be noted. Very frequently the habits of growth in the two pairs of feet vary, indeed they may be diametrically opposite. For instance, if the heels grow too rapidly in the front feet, as in this case, the toes may lengthen too quickly in the hind feet, attended with abnormally low heels. Then the toes of the hind feet should be pared down and foreshortened, while the shoe should be light and armed with oblong heel calkins, extending back, from one-half to three-quarters of an

Digitized by Google

inch beyond the heels. The effect, upon reflection, is obvious. The action in front has been lowered and lengthened, attended with a measurable retardation. To prevent interference from the hind limbs, either by forging or speedy cutting, the hind action must be regulated in accordance with these changed conditions. Foreshortening and lowering the toes of the hind feet give them less power or leverage to interfere with the front action. To prevent the quickening of the hind stroke, and at the same time to give it length of sweep commensurate with the elongated front action, the ground surface of the hind feet is lengthened at the posterior portions, while the oblong heel calkins cause the hind feet to strike the ground quicker than would the plain plate fitted neatly to the hoof. The calkins are made oblong, not only because they are more in accord with the low, gliding movement of the hind hoofs that always swing close to the ground as their base of propelling action, but because they dissipate the concussion and pressure instead of concentrating them as do the upturned calkins.

When these instructions are carefully and patiently observed, the defective action of this horse should be radically improved. But the obstructive hindrance to remedial shoeing is the impatient haste of the average experimenter. If the proposed results are not instantaneous, no matter of how long standing may have been the troubles, the horse owner is very apt to discontinue the treatment in discouragement. But that is not the course that has led to the gait-regulating successes of the most skillful trainers of phenomenal colt performers, whose action in their first harness lessons is often very far from the perfection it becomes by patient study.

By far the greatest difficulty relating to the trotting horse is the want of balance or harmonious action between the hind levers and the front limbs in locomotion. Very often the feet interfere, causing, at an ordinary jog, that most annoying of all troubles, constant forging and clicking together of the front and hind shoes; and when the gait is quickened, more serious disturbances, such as speedy-cutting, and tendon-striking in front and scalping and shin-bruising behind, result. If every horse that has the ambition and capacity to trot fast could be balanced sufficiently to obviate these interferences, the number of standard performers would be increased many fold. The current axiom among farriers is, that no two horses that thus interfere can be shod alike. This conclusion would indicate the absence of general, scientific principles, which conclusion is not correct. In all such cases the center of gravity of the carcass requires either a forward or backward shifting, to tax the extremities that have too much action and to relieve those that have deficient movement. Any remedial system that overlooks the powerful agency of the center of gravity will fail of its mission. The more desperate the case, the more necessary is the co-operation of this important factor.

From Canal Dover, Ohio, comes the most desperate instance of inharmonious action that the writer has ever had presented to him. The very intelligent correspondent admits that he wrestled unsuccessfully with it all through the past season. His mare "stubs her front toes "frequently when jogging. At a mod-"erate gait she strikes the hind toe "against the arch of the front shoe." Even "when barefooted, she will scuff "her feet together, *though not so bad as* "*when shod.* She goes very low to "the ground; she moves naturally very "wide behind, but on attempting to "speed her she scalps and cuffs herself "so severely behind that she hitches and "breaks. *When, at times, she goes per-*"*fectly square, the hind feet lap over the* "*forward footprints, from three feet six* "*inches to four feet two inches, at the* "*same time hitting the hind shin boots,* "*ankle, and speedy-cutting boots very* "*hard.*"

The reader will at once conclude that, if this mare's feet can be brought into harmonious action, then there is balm in Gilead to every trotting horse whose extremities are as awry as nature's freaks can make them; and yet she can be materially assisted.

The first thing to be recognized as a starting point is the fact that she "seems

to want her head low," and that she interferes less when barefooted than when shod. The kindergarten track, in addition to developing the ambition and lung-capacity of youngsters to trot, has the invaluable excellence of indicating the natural carriage of the head and neck while speeding without being subjected to any harness restraints or draft burden. The natural tendency of overcoming draft is to lean forward, or lower more perceptibly the elevation of the head and neck, than when unincumbered with any other weight than the carcass. The natural carriage of this mare should be noted, when turned into a paddock, both with and without shoes. If she forges more with shoes, then does she carry the head and neck at a greater or less altitude when shod than when barefooted?

The almost invariable rule is that the head and neck are carried lower, as the forging increases. Here is an admirable subject for experimenting with the fitting rigging. It is of no moment that "she seems to want her head low, and resents high checking." The muscles of the neck can be manipulated even on the ewe-necked, crest-fallen type, till they become almost as pliable as the flexors and extensors of the forearm under the massage treatment; and it is well known that the latter can become so developed that a low, stiff-gaited horse forehanded, can be taught to do the bold, lofty, Spanish trot with admirable effect. This mare urgently demands the fitting rigging treatment, with kindergarten accompaniment. Gradually the head and neck can be elevated, and the resentment resulting from discomfort will just as perceptibly disappear. Quite as certainly will the forging and interference cease, when the aids of properly dressing and arming the feet come to the support of the elevated head and neck.

The owner says "she swings the hind feet out, around the forward ones," and yet he added a ten-ounce side weight to each hind shoe. The effect of this appliance would be to exaggerate the straddling movement behind, when speed invariably requires the closing up of the hind movement as much as possible, to bring it into line with the front action. Moreover this excessive width of the hind action is not only contrary to speedy results, but exceedingly tiresome to the muscles of the hind quarters, because instead of forcing them forward they move in a diagonal line to the direction of the body. Widening the hind action beyond ankle-cuffing of the hind limbs is exceedingly questionable, as a mechanical necessity. This mare has such an enormous excess of hind action that all weights beyond that necessary to give sufficient stiffness to the web of the shoe to prevent it spreading should be avoided. In every way known to mechanics the hind leverage or propelling power must be taxed to bring it into harmony with the front movement. The first method of elevating the head and neck has been sufficiently presented. That operation throws the center of gravity further back in the spinal column, thereby relieving the horse forehanded, and taxing the hindquarters. Then the hind feet must be worked upon. They must never be foreshortened. The ground surface must be increased, not by projecting the shoe beyond the toe, but by extending its branches backward beyond the heels. It must be concave seated, not beveled into the rolling motion, for that quickens the articulation, which is the precise result to be avoided, and yet the toe must be so fashioned that there is the least possible substance to come into contact with the uplighted arch of the front shoe on the same side of the body. The most ingenious invention to compass this result is the "scoop-toed" shoe designed by Mr. Robert Bonner. The toe at the ground surface must be scooped out either by forging or by hot filing with a half-round rasp, so that the web at the toe, for an inch or more, is about one-half of the original thickness. No design compares with this pattern for excessive action behind; for while it takes away from the uplifted toe much of the purchase that enables the abnormally developed hindquarters to push the limb forward, it does not, in the slightest degree, quicken the articulation that is the effect of the rolling-motion shoe. But the projected heels should be armed with oblong calkins, made at least as thick as the web of the

Digitized by Google

shoe, and, in this instance, it would prove beneficial to make them somewhat thicker. These projected heel calkins cause the hind feet to land quicker, and thus perceptibly shorten the stride, while the increased ground surface requires a longer time in revolving the foot, and the scooped toe detracts from the purchase power just as the upturned foot is in the act of springing from the ground. No side weights or lowering of the heels are permissible, for both increase the articulation, which should be lessened. The hind shoes should be made as light as possible, for weight promotes increased muscular action.

If the hind action is still excessive, then replace the scoop-toed shoe with a tip ending an inch in advance of the middle of the quarters, provided with a scoop-toe, and not weighing more than two ounces. When every other device fails to reduce exaggerated hind action, this armament will promote the most favorable results.

The front feet must be dressed to a perfect level and balance as described in a former paper. Care must be taken, not only that the quarters must be of the same width, *but the sole must be pared so that neither side of the foot shall be heavier than the other.* This is a matter that has received very little attention from farriers. When a horse brushes his front knees, not enough to bruise them, but to chafe them sufficiently to annoy him, and the front feet are apparently level and balanced, *an undue thickness of the sole on the inside branch* will be sufficient to give such a preponderance of weight to that branch as to control its motion, and incline it inward toward the other knee. Balance means an equipoise of weight as well as of proportions. The front feet, therefore, must be reduced to this perfect balance, in order that there shall be no lost motion in their articulation and direction, neither of which have they any margin to afford. The front shoe should be rolling motion broader in the web from the middle of the quarters to the heels than forward, to accomplish a double purpose. The posterior broad web prevents the foot, upon landing, from sinking deep into the ground, and that is an advantage gained when the front movement is to be accelerated. Anterior to the center of the quarters the web of the shoe should be cut out on the inner edge all around the toe. That lessens the margin of the arch of the front shoe liable to be struck by the toe of the hind shoe in forging. The bevel or rolling motion of the front shoe should be continuous from heel to quarter, leaving the heel rather thick, and the center of the quarter the high point, and then again descending to the toe. Care should be taken to prevent the smith from forging the outside margin of the shoe at the forward arches of the foot to a sharp feather edge, for that construction admits of wabbling, either to the outside or inside, when only the backward and forward articulation of the front feet, in a straight line is sought to be promoted.

The front shoe should not weigh more than twelve or fourteen ounces. Excessive weight in this defective action rapidly promotes exhaustion of the flexor and extensor muscles of the front limbs, and weariness, forehanded, would defeat the object sought to be attained, despite all the precautionary methods herein suggested.

The front hoofs should be moderately foreshortened, not so much so as to interfere with the full articulation of the pastern, and the heels left rather high, not enough to produce the bruises called corns. If the heels are low and the toes unusually long, then the anterior margin of the wall on the ground surface must be reduced, in addition to the foreshortening of the toe, and the heel of the shoe swedged thicker than when the foot is normal in growth.

Finally long-continued jogging should be absolutely stopped. Nothing confirms laggard action like the tiresome routine of wearisome jogging. Short, sharp, quick work, at stated places on the road or track, in which the driver inspires the ambition of the horse with all the magnetic enthusiasm of his own nature, is worth more to correct defective action and to promote improving speed than all the miles of slow torture that the elder trainers ever insisted upon to condition the trotting performers of the olden times.

CHANGES IN THE STANDARD.

EDITOR OF THE MONTHLY:

IT is apparent that important changes in the trotting standard can not much longer be deferred, and the question naturally arises how far shall such changes extend? To answer the question properly we must first determine what defects the test of time and experience have developed in the standard as it exists, then we can with better understanding aim to remedy such defects.

When the standard was first adopted, it was like taking a step in the dark, and we were without the light of experience to guide our feet. The breeding interest was then comparatively small, and even the largest of our stock farms made but moderate showing in stock eligible for registration, and it is questionable whether the aggregate number of such stock in the entire country exceeded 3,000 head. On a rough estimate it is probable that to day we have in the neighborhood of 50,000. Then (to paraphrase a well-known expression) we were confronted by a theory, not a condition, now we are truly "confronted by a condition, not a theory." Then we had everything to learn, now we know something about the business.

The strength of a chain is not governed by its strongest link, but by its weakest link, and so the value of the standard must necessarily be measured, not by its strong rules but by its weak rules, and although the object of the standard was stated to be the establishment of a breed of trotters on a more intelligent basis, yet candor will compel every thoughtful man to acknowledge that the various weak rules of the standard have resulted in flooding us with standard-bred animals rather than in establishing a breed of trotters. We can now see that the framers of the standard insufficiently understood biological laws, else so many worthless "sisters and their cousins and their aunts" would not have been allowed to enter on reflected glory instead of personal merit that was not demanded. Two wrongs do not make one right, and because we have been governed by bad standard rules so long is no reason why we should always continue so ruled. It is barely possible that easy rules for acquiring standard rank were a necessity while standard horses were scarce, but surely no such reason exists to-day. In the beginning Mr. Wallace used to proclaim that for a horse to be standard under Rule 6 was to be standard under the highest possible rule. It does not look that way now, for with thousands of absolutely worthless animals admitted under easy rules, by reason of mere relationship, it has become too easy and common for such worthless standard horses to be bred together, thus flooding the country with progeny even worse than the parents, but yet standard under "the highest possible rule." The evil has become so great that merely palliative measures will not do, and heroic treatment is an absolute necessity to save the standard from universal ridicule.

It is even a serious question with some of our best minds whether the immense number of worthless animals now standard will not gradually undermine public confidence in any revised standard on the ground that the damage is already done and that there is no use in closing the stable door after the steed has escaped, for any new rules, no matter how severe, probably would provide for more or less standard relationship, and the miserable trash already in would thus continue to be a source of pestilential contamination. Breeders have here to deal with a severe case, a desperate case, and the remedy will not be found in gentle sedatives nor soothing syrup. The trouble is like a cancer, and should be cut out as ruthlessly as a surgeon would remove such cancer, and the longer the operation is deferred the worse it will be for the patient. No half-way measures should be tolerated, no mistaken tender-heartedness shown toward those who wish to breed a class of animals that will just barely slump into the standard fold under some easy rule, without possessing the slightest personal merit.

The rules should be based not upon performance alone, but performance in connection with breeding or potency, as a measured guarantee that the animal has an inheritance and is not a sport or freak

Digitized by Google

of nature. Mere relationship should be discarded to the utmost possible extent while in the formative state and until it is clearly evident that a breed is established and the present immense supply of no account standard relatives is frozen out. Even Rule 6 should be amended so as to demand a test. For these various reasons the set of new rules recently proposed at the meeting of the Register shareholders is sadly deficient, and instead of remedying the evils that we are now suffering from would only increase them. We are years past the necessity of admitting "any mare whose sire is standard and whose first and second dams are by standard horses," for we already have an uncomfortable surplus of just that kind that are not worth houseroom or feed. What is needed is the horse or mare that can trot or produce speed, or both. For months past the turf papers have been filled with complaints against the increasing 2:30 list, although no horse can enter *that* list without being something of a success, yet we have not heard the proper outcry against breeding thousands upon thousands of absolutely worthless standard-bred "trotters" from absolutely worthless standard-bred "trotters." This seems like getting the cart before the horse. To inveigh against 2:30 success ought to be called and considered ridiculous; not to inveigh against what is causing serious trouble is stupid, and not to remove the cause of such trouble is almost criminal. The shareholders of the Register company unquestionably think less of making money for themselves through such shares than of having the power to legislate; for that reason they should care less for large revenues from registration, with consequent debasement of the standard horse, than for stringent rules, smaller revenue and an improved standard horse, till a fixed breed ensues. We have heard all about the terrible evils of trotting horses a full mile in 2:30 for a tin cup, and how it was to bring universal ruin. Now let us hear something against breeding together horses that can't trot at all, although "standard," and after filling the land with their kind, the entire lot—sires, dams and offspring—are not worth the identical tin cup that the tin-cup trotter won by trotting his mile in 2:30.

If standard rank is to mean anything and to improve values, let us have rules that will compel breeding to good standard stock, and operate against breeding to poor standard stock. To this end I would not admit a new stallion of unknown breeding and no speed merely because he produced even twenty-five 2:30 trotters, nor would I admit a mare of unknown blood and no speed simply because she produced 2:30 trotters. Such animals could appear in the tables, but I would not confer standard rank upon them, which would prevent bringing into the standard a lot of useless relatives. The performing progeny should not even become standard until they had reproduced performers, or proved that they possessed potency. Then, by not registering an animal, even under Rule 6, until said animal had either trotted in 2:30 or produced a 2:30 trotter, we would gradually get rid of the undesirable element now in and be able to form a real breed of potent trotters. We have all these years been breeding under rules which might well be entitled "How not to do it," and it is high time that we should switch off to the right track. Of course worthless horses that are now registered would have to stay in, but the Register Association is no more under obligations to keep Rule 6 intact, so as to admit of their reproduction, than to maintain any other rule or not to make new rules.

To illustrate my views more clearly, I submit a list of rules, not believing them perfect, but in the hope that they will suggest improvements to your readers and bring the same before the public. I retain the 2:30 limit intact, as that speed rate seems all sufficient when coupled with more stringent requirements. I believe that a graduated scale of alternative rates of speed, such as a stallion producing five 2:30 trotters, or three 2:25 trotters, or two 2:20 trotters, or one 2:15 trotter is wrong in principle and somewhat confusing. One 2:15 trotter may be an accident, two 2:20 trotters may be due to two extra good mothers, while a large number of 2:30 trotters shows uniform power of production. I omit geldings as they are valueless in the stud.

Digitized by Google

1. Any stallion with a trotting race record of 2:30 or better, provided that five of his get have trotting records of 2:30 or better, and also that his sire or dam is already a standard trotter.

2. Any stallion that is the sire of ten animals with trotting records of 2:30 or better, provided that he has a trotting race record of 2:30 or better, or, that his sire or dam is already a standard trotter.

3. Any mare that has a trotting race record of 2:30 or better, provided that her sire or dam is already a standard trotter.

4. Any mare that has produced one animal with a trotting race record of 2:30 or better, provided that she has a trotting race record of 2:30 or better, or, that her sire or dam is already a standard trotter.

5. The female progeny of a standard trotting horse and standard trotting mare when it shall have acquired a trotting record of 2:30 or better, or, when it produces a 2:30 race trotter.

6. The male progeny of a standard trotting horse and standard trotting mare when it shall have acquired a trotting race record of 2:30 or better, or, when it sires two 2:30 race trotters.

7. The progeny of a standard trotting horse with a race record of 2:30 or better, when out of a standard trotting mare with a record of 2:30 or better.

Upon the adoption of such a standard, a law should also be passed limiting the life of such standard to say twenty-five years without change, at the termination of which period the standard, by self-operation, shall close, and thereafter no horse be eligible for admission except by a standard trotting horse out of a standard trotting mare already registered.

A Breeder.

DOES BLUE BULL BREED ON?

BY L. C. CLEMENT.

In an article under the caption of "Breeding On" *Western Resources* gives a very interesting table. "This table includes sires that have one or more of the following requisites: First, has sired ten or more trotters and pacers; second, has sired sons that have sired ten or more trotters and pacers; third, has sired dams that have produced ten or more trotters or pacers.

The table seems to be exhaustive and the accompanying article very instructive and well written, but after giving Blue Bull 75 apparent justice, it is so qualified that it seems to be worse than no praise.

I quote as follows: "We think that while some certain well-known horses have forced success with the poorest opportunities conceivable, in itself it is no evidence that they will breed on, in fact, there are cases that those opportunities are good reasons why they will not breed on. For instance, to be personal, which is something that we dislike to be in an article of this kind, we will take Blue Bull 75, who, when opportunities are considered, *has no equal in the great table in the first generation.* But how does he look in future generations as compared with other great horses that were foaled about the same time that he was? Blue Bull was foaled in 1854, and out of the commonest mares in the country he produced fifty-eight list trotters and pacers, twenty-six of his sons sired forty trotters and pacers, and thirty-six of his daughters have produced forty-one trotters and pacers. George Wilkes was born in 1856, two years later. He sired seventy-five list trotters and pacers, seventy-five of his sons sired 488 trotters and pacers, and thirty-four of his daughters produced forty-two trotters and pacers. Thus Blue Bull was a great horse, and had he been coupled with mares of excellent breeding, there is no question but what his roll of honor would be well up with the few of the strongest."

We can scarcely claim that *Resources* has damned with faint praise, but just such writings and opinions, expressed and written, have done more to keep Blue Bull from breeding on than even the unsurmountable obstacles (to other sires) of the very inferior mares he served.

Resources has made a comparison with

Google

the only horse whose get have won as many trotting races as the get of Blue Bull, and yet he has shown that not as many of the daughters of the mighty George Wilkes are producers, and that all together they have only produced one more than have the daughters of Blue Bull. In a table of all sires whose get have won twenty or more heats in 2:30, the old pacer Blue Bull leads with thirteen, with George Wilkes second with twelve, and Volunteer third with eleven. While looking at this list it occurred to me that as Blue Bull and Volunteer were both foaled the same year, and Volunteer lived within two years as long as Blue Bull, and as no one would dare intimate that Volunteer was not breeding on, a comparison might not be out of place. I turn to the Year Book and find Volunteer has twenty-nine trotters and one pacer, thirty in all. Blue Bull has fifty-four trotters and four pacers, clearly leading Volunteer by twenty-eight. Each has five in the 2:20 list. Twenty-nine of the sons of Volunteer have sired 2:30 trotters and pacers, while only twenty-six of the sons of Blue Bull have yet been so fortunate. On the female side the tables are turned, only twenty-nine of the daughters of Volunteer have produced, against thirty-six for the daughters of the despised pacer.

There are registered and numbered in Volume IV, thirty-two sons of Volunteer and four sons of Blue Bull. The oldest son of Blue Bull represented in the lists is Blue Bull Jr. (Neosho), sire of three in the 2:20 list. Only one son of Volunteer has so many standard representatives in the list as Jim Wilson, son of Blue Bull, and he is handicapped by the worst color in the world, being a gray, and his dam is given as by Gray Hawk Morgan—not fashionable breeding. Only three sons of Volunteer have more in the 2:30 list than has Prompter, who has three trotters and one pacer. Prompter was not standard until in 1883 his half sister, Flight, made his mother standard, and in 1885 he was registered under Rule 6. His son, Apex, 2:26½, that defeated Stamboul in a three-year-old race of five heats, is the sire of Dot, 2:29½. By reference to Volume III of the Year Book I find that in 1887 eighteen of the sons of Volunteer had sired 2:30 trotters, and sixteen daughters had produced, and Blue Bull was represented by but five sons and ten daughters. Volunteer has advanced from eighteen to twenty-nine, a gain of eleven; Blue Bull from five to twenty-six, a gain of twenty-one. Volunteer has now thirteen more producing daughters than in 1887, and Blue Bull has twenty more producing daughters now than he had four seasons ago.

It is claimed by those in a position to know that Blue Bull has left but about ninety sons all told, and the majority of them are non-standard only as they are made standard by the performance of brothers and sisters, and by the performance of their own get. Only nine sons of Blue Bull are registered as standard in Volumes IV and V of the American Trotting Register. If the number of entire sons is covered by the figures given (ninety) then nearly one-third of all of them have sired standard speed. Not more than three or four of them are standing at a fee of $50 or more, while the most of them are serving at $10 to $25. That Blue Bull Jr. is not only transmitting speed, but extreme speed, is shown by the fact that all his performers are in the 2:20 list. St. Nicholas is a very showy horse, and has been sold for more money, as a fancy driver, than most fashionable sires will bring as stock horses, from a daughter of Harry Glenn, a horse two years older than St. Nicholas, that never sired a trotter, he sired St. Lewis, 2:21½, at three years of age.

The blind horse, Roger Hanson, has never sired but two trotters, one out of a daughter of Blue Bull, the other the flower of Golden's string, Jessie Hanson, 2:21½, and twenty-two heats better than 2:30.

Rushville, son of Blue Bull, out of a saddle mare, sired Gipsey Queen, 2:19¾, and twenty-seven heats better than 2:30. Eight of the sons of Volunteer have sired nine in the 2:20 list. Six of the sons of Blue Bull have nine in the 2:20 list, and Lockerbie, son of Blue Bull, sired the trotter Maud Muller, 2:20½, dam of American Girl, 2:20¼ pacing, and her sire is given as by Pocahontas Boy or Blue Bull 75, and has two in the 2:20 list.

One of the strongest arguments that

Digitized by Google

can be advanced why Blue Bull is breeding on, and breeding race horses, is that while four years ago only five of his sons were represented in the 2:30 list, the list of sires of trotting race winners, with twenty or more winning heats, gives to Jim Wilson, Belle Wilson twenty heats and 2:25¼, Pawnee twenty-eight heats and 2:21¾ and Ironwood twenty-two and 2:23¼; to Lockerbie, Maud Muller twenty-two heats and 2:20¼, and to Rushville, Gipsey Queen twenty-seven heats and 2:19¾. Four years ago Lockerbie and Jim Wilson had one each in the list and Rushville was not represented. The dam of Gipsey Queen was a saddle mare, the dam of Ironwood is unknown: the dam of Maud Muller is out of a pacer of unknown breeding, and the dam of Belle Wilson is a daughter of Thomas A. Scott 6355, foaled in 1873, and is breeding on (because he sired Pat, 2:26¾, with one heat in 2:30, and out of Betts, by Legal Tender, the pacing sire of Red Cloud 2:18, and forty-six heats in 2:30 or better). It is not at all likely that this scion of the house of Mambrino Patchen gets any help from this pacing son of the pacer Davy Crockett.

When it is remembered that the best son of Volunteer that has come to the front in the last four years is Kentucky Volunteer 2784, dam the pacing daughter of Blue Bull 75, *Kentucky Girl*, and that Harvey, 2:21, by him and out of Lucy, by Kentucky Chief (a horse that never sired a trotter), and that he has twenty-one heats in 2:30 or better, and that twelve of them were trotted in 1891, and that the sire of the greatest campaigner yet foaled out of a mare of untraced breeding is by Roscoe Conkling, a son of Gov. Sprague and out of Bertie, by Blue Bull, and that the fastest daughter of Pilot Medium, the great Michigan sire, is out of a daughter of *a son* of Blue Bull 75, and that the great campaigner Jesse Hanson, is out of a daughter of another son of Blue Bull, and his only other 2:30 performer is out of a daughter of Blue Bull, *and that as a sire of race winners*, Blue Bull *leads all the great family of* MESSENGERS; that all of his get as race winners are second only to "Bill Simpson's pony," the great George Wilkes, 2:22, it will take more than a passing paragraph in *Western Resources*, and more than the pen of the wonderful and versatile "S. T. H.", though he write "The get of Blue Bull are *toe weight trotters, knee-bangers and never first class as race horses*," to stop him from breeding on. The breeders and buyers of race horses and breeding stock will be skeptical in view of all these facts. Blue Bull is to-day breeding on, against all obstacles, individually the greatest sire, he transmitted his greatness to every son and daughter, though the dam be a cart mare or like Texas Jack, 2:28¼, a despised Texas pony.

Digestibility of Cattle Foods.

THERE has been received from the Maine Experiment Station a bulletin showing the digestibility of various cattle foods and as the same is of interest to horsemen it is given herewith.

SUMMARY OF DIGESTION COEFFICIENTS.

	Dry substance.	Organic matter.	Ash.	Protein N×6.25.	Fiber.	Nitrogen-free extract.	Fat.
Hungarian Grass	63.4	65.6	35.5	62.4	67.8	65.8	52.3
Hungarian Hay	65.	66.3	47.4	60.	67.6	67.1	63.8
So. Corn Fodder	69.4	70.6	57.4	65.4	74.2	69.5	70.9
Field Corn Fodder	70.6	72.4	52.9	61.8	75.6	72.6	70.2
Sweet Corn Fodder	69.7	73.5	39.4	61.8	76.7	72.1	76.4
Timothy Hay	58.5	60.1	29.6	44.1	56.4	63.6	74.3
Timothy Hay	59.1	60.2	39.7	47.5	54.8	64.7	69.8
Sugar Beets	94.5	98.7	31.9	91.3	100.7	99.9	49.9
Mangolds	78.5	84.8	16.4	74.7	42.8	91.3	....
Rutabagas	87.2	91.1	31.2	80.3	74.2	94.7	84.2
Eng. Flat Turnips	92.8	96.1	58.6	89.7	103.	96.5	97.5
Gluten Meal	87.4	89.1	....	86.6	....	90.8	87.8
Wheat Bran	59.8	64.	....	82.1	36.2	64.1	64.

(1.) The hungarian grass, both when fed green and after drying, proved to be more digestible than the average of other grasses—notably more so than timothy.

(2.) The drying of the hungarian grass into hay did not diminish its digestibility. This is in accordance with all former experience.

(3.) The corn plant as cut for the silo is one of the most digestible of fodder plants, rating in these experiments as compared with timothy as 100: 120. Sixty per cent. of the dry organic matter of timothy was digested, while with the various corn fodders the average was seventy-two per cent.

The experiments of this year disclose

Digitized by Google

no especial differences in the digestibility of the southern, field and sweet corn fodders.

(4.) The digestion trials with roots show them to be the most digestible of any of the foods tested, the amount of waste material being very small, averaging not over eight per cent of the whole.

(5.) The gluten meal, which is a waste product in the manufacture of glucose from corn, was digested to the extent of eighty-nine per cent of its dry organic matter, which does not differ at all from the figures given in the German tables for the entire grain. The treatment which the grain receives in converting the starch into glucose does not seem to affect the digestibility of the refuse.

(6.) The second trial of the digestibility of American wheat bran gives average figures almost similar to those obtained in the first trial, and shows this cattle food to be but slightly if any more digestible than good hay and much inferior in this respect to grains such as maize, oats, barley, etc.

The All-Purpose Horse.

In the *Breeders' Gazette* for March 16, appears an article by Mr. E. T. Dougherty in reply to certain strictures by Mr. Burgess on the "all-purpose horse." Mr. Dougherty defines the animal alluded to as follows:

"He is well bred, not weighing over 1,200 pounds, and hardly ever over 1,150 pounds. He has good action; you can plow him all day and ride him sixty miles in a day and drive him back the next without hurting him, and will sell from $175 to $500."

To this Mr. E. A. Olleman replies as follows: "I accept this definition or description of an "all-purpose horse," and will proceed to answer to the best of my ability the query by the *Gazette* closing the communication of Mr. E. T. Dougherty.

I will say frankly, many standard-bred trotting and pacing stallions crossed on good roadster mares weighing from 900 to 1,200 pounds, also standard-producing and standard-bred mares, have produced and are now producing the best all-purpose horse the world has ever known.

With this object mainly in view we commenced some four years since to make horse-breeding the special feature of our farm, and selected for our premier stallion a horse sired by Egbert 1136, dam Cut, by Brignoli 77; second dam Crop, by Pilot Jr. 12, and weighing about 1,200. We had several well-bred roadster mares doing our farm work, and have added several others, some standard-bred and some standard producers. We reasoned from this standpoint: It is seldom our best standard stallions put more than three per cent of their get in the 2:30 class so as to command large prices, leaving 97 per cent to find some other market or meet some other demand. It is this 97 per cent we have kept mainly in view, and we are not disappointed or going to be disappointed, for while I am now writing three of our broodmares, with a gelding, hitched to two wagons, in pairs, loaded with live hogs, weighing 3,600 pounds to each load, are on their way to the stockyards at Indianapolis, Ind., fourteen miles distant, and will be back home this evening to work on the farm to-morrow, and will then plow more in a day than any heavy draft horses I ever knew. The next day, should we wish, they would pull a spring wagon sixty miles and return the following day without injury. Two of these mares are standard-bred and one nearly so, and will weigh, respectively, 1,050, 1,100 and 1,150. Our broodmares do our farm work, and do it satisfactorily.

We expect our four-year-old geldings, sired by standard stallions, to average us over $200 each. Why? Because they are good-sized (16 hands), stylish, good colors, manes and tails, and good roadsters for gentlemen's drivers or family horses. Just such as these are and always will be in good demand by men and women who are able and willing to pay a good price for what they want. These geldings will pay us well for their raising, far better than a lot of fat cattle we have just closed out at a loss, not paying us the cost of the grain and grass they consumed.

In addition to this we have a gelding that promises to make a low record this season, although we have been working him on the farm considerably, and he

will probably bring us $1,000, possibly double that sum, for he is sired by our own standard horse and out of a well-bred mare. Should we realize our expectations from this gelding, we will accept it as one of the prizes that occasionally fall to the lot of those engaged in breeding standard horses. At the same time we are justified in saying we have one or two other very promising colts that we hope will be fast. We have our own half-mile regulation track and we try to develop our colts enough to find out if we have anything extra fast that will go in the 2:30 class, so as to realize as much as possible from our business. In any event we are very sure to get a good roadster, and it goes into the 97 per cent.

Now a word or two to the breeders of standard-bred stock. Let us avoid the rock on which the breeders of Shorthorns foundered and profit by their error. For many years they seemed to be guided alone by pedigree without much regard to individual excellence, and so taught many beginners. We all see the disastrous results—a vast number of pedigreed scrubs, worse than a curse, for it has produced distrust upon the best breeds, upon the minds of many as to the value of the breeds themselves, and entailing widespread loss upon the designing as well as the honest, faithful breeder, involving all in the common disaster.

We are only establishing a distinctive breed of horses, and it being purely American, every citizen of the United States should be proud of our attainments and deeply interested in what will be accomplished in the next half century.

Until recently in the establishment of the breed of standard horses nearly every other quality has been sacrificed to speed, with but little regard to individual excellence or soundness, but we have begun to realize that 97 per cent are not winning fast horses, and we must find a market for them or the business will not pay, and if they are not fast, are undersized, unsound, and poor individually, where will you find a market? You simply have a poor pedigreed scrub; you are traveling the road the Shorthorn men trod in anguish.

The demand is here; the hour is at hand when pedigree is only a part. Essential it will always be, but there must be individual excellence, including not only speed but good size, style, color, beautiful, proud action, symmetrical form, and not least, great endurance. As to the latter, the writer is of the opinion there are now every year on the race courses examples of greater endurance in the contests for supremacy among standard horses than is shown by the thoroughbred or any other breed of horses. The quality of endurance in the thoroughbred is fast being eliminated by the manner of races as at present conducted, being only a single heat for a short distance. The writer would like to see the old style of running races revived—two and three-mile heats and repeat. The dung-hill was not in it. It developed and required a great quality — endurance.

Let breeders of standard horses use the knife liberally. Do not let a great pedigree deter you, but so important do we regard standard breeding that we use the knife without hesitation on all non-standard colts, and will not spare even the standard-bred unless there is good individual excellence. Thus we will progress onward, perfecting the American standard-bred, from which will be produced not only the two-minute horse but the most superb "all-purpose horse" the world has ever seen.

I do not disparage any good breed of horses; "many men have many minds." There is a place and room for all distinctive breeds of good horses in our country. I have only tried to give my opinion of my choice of breeds and their excellence and future capabilities, and if in illustrating I have been too personal, my only excuse shall be, I know no better way than illustrating by actual experience of demonstrated facts.

Mr. De La Vergne on a Rule.

EDITOR OF THE MONTHLY:

IN the last MONTHLY I notice that you published a number of letters and interviews with drivers, in regard to Section 12 of Rule 29. of the rules and regulations of the National Trotting Associa-

Digitized by Google

tion, passed by the congress of 1892, the rule reading as follows:

"Only one heat in a race may be dropped by any horse in a race, and only then by permission of the judges first obtained and announced from the stand prior to the heat, and no money shall be won or lost on such horse in that heat. A violation of this rule may be punished by fine, suspension, or expulsion."

First, it was attempted by a considerable number of the members present to pass a rule against selling pools on heats. If this could have passed, it would have undoubtedly done away with the necessity for adopting the above rule, as the interest of the pool-box workers could not then have been served by the laying up of heats. This new rule was adopted solely for the purpose of preventing drivers from laying up heats in the interest of those who work the pool-box to the disadvantage of the public who attend the meetings, and in applying it the judges would not and could not punish the driver for losing a heat in case he met with unexpected set-backs, which frequently happen while a race is being driven. But, in case it is reasonably clear to the judges that the driver has dropped a heat without giving the notice required, for the purpose of favoring those who work the pool-box, or, for any other unwarrantable reason, it would be their duty to punish said driver as the rule directs.

I was present at the congress and took part in the debate on this proposed rule, and am clear that the above interpretation of it is justified by the arguments made for and against it just previous to its adoption.

J. C. DE LA VERGNE.

Reminiscences.

MR. S. HOAGLAND has been a prominent factor in trotting matters on Long Island ever since he first located in Brooklyn. He owned and trained many of the best horses in days gone by, and the fires of youth glisten in his eye as he relates the stirring scenes of those early times. He sold Lady Palmer to Mr. Robert Bonner when that gentleman put together his first famous pair, Lady Palmer and Flatbush Maid. Hiram Woodruff was particularly sweet on the gray mare Peerless, by American Star, also owned by Mr. Bonner, and a friendly rivalry sprung up between Hiram and Mr. Hoagland as to the merits of the two mares, the result being that a race was arranged to wagons at two miles, Hiram driving Peerless and Hoagland Lady Palmer. Mr. Hoagland won in the fast time of 4:59, which considering the track and weight of wagon and driver, was a wonderful performance. Abdallah was an especial favorite with Mr. Hoagland and he had a decided liking for his get. "They were all race horses," said Mr. Hoagland, "and not one of them picked up more than he would carry to the end of the route." Mr. Hoagland owned the first foal ever sired by Abdallah, and when the old horse had died of starvation and neglect on the sandy beach he sent over and had the tail cut off, later on presenting it to Mr. John H. Shults, of Parkville Farm.

A relic of other days that Mr. Hoagland prizes highly is one of the stud announcements of imported Messenger. I saw it, and it was unique, to say the least. It begins: "To be let to mares this season." After the location is described the price is given: "At £5 the season for each mare, the money to be paid by 1st September next."

Farther down the poster the horse is described. The full-blooded horse Messenger, imported in May, 1788. His size is given as fifteen hands three inches. Then follows in detail the races he won in England during 1783, 1784 and 1785.

Among the relics preserved is the watch that officially timed Pocahontas when she paced her famous mile to wagon in 2:17½, and that also marked 2:15 when Ethan Allen and mate beat Dexter.

Mr. Hoagland was the owner of Grey Messenger, a horse of considerable prominence at that time, and he also bred Privateer, by Grey Messinger, out of Lady Moscow, and named him for his friend Charles Foster.—*Albemarle in the "Spirit of the Times."*

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, JUNE, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00
All in one order..... 35.00

Young Great Broodmares.

THERE is in some quarters a prevalent idea that the quality most essential in a broodmare is that characteristic which has been variously described as "nerve power," "vim," "energy" and otherwise designated, no matter how, so that it indicates the possession of plenty of vitality and animal spirits. That this quality is ordinarily found in the mares that have been most productive of 2:30 speed and also those whose sons and daughters have attained prominence in the breeding ranks is true enough, but it is also becoming apparent that the great broodmares of to-day among the younger generation are also the most highly-bred matrons, and it follows logically that those which are to attain eminence in the future must also carry a large percentage of performing blood. A writer in *Clark's Horse Review*, has learned from the records the interesting fact that the youngest Great Broodmare was foaled in 1884, that the youngest which has produced three in the list was foaled in 1881, that the youngest with four to her credit was foaled in 1880, the youngest with five to her credit in 1876, and the youngest with six and seven was also foaled in 1876. A list of these mares, together with the name of their sire and the sire of their dam, is herewith given, and is as follows:

Name.	*Foaled.*	*Sire.*	*Sire of Dam.*
Lady Pepper	1884	Onward, 2:25¼	Blood Chief 792
Sonnet	1881	Jay Gould, 2:21½	Flying Cloud 134
Mabel L	1880	Victor, 2:23	Volunteer 2:37
Lucia	1876	Jay Gould, 2:21½	Geo. M. Patchen, 2:23½
Sontag Mohawk	1876	Mohawk Chief,	Toronto Sontag 807

The first thing that will strike the reader is the fact that four of these five mares are by sires with records better than 2:30, two of them being by Jay Gould, 2:21½, one by Victor, 2:23, and another by Onward, 2:25¼. Jay Gould is a son of Rysdyk's Hambletonian, and Onward is a grandson of the same horse. The other mare in this select list was sired by Mohawk Chief, a son of Rysdyk's Hambletonian, so that in the male line four of the five mares trace directly to Hambletonian 10. Another feature of the matter that is of interest is that the dam of the youngest mare in this list was Fanny Robinson, 2:20¼, and that the dam of Lucia was Lucy, 2:18¼, so that in the female line, as well as the male, developed speed is more than ordinarily prominent. George M. Patchen, that is the sire of the dam of one of these mares, was a trotter in his day with a record of 2:23½, and Volunteer, although his best record (made to wagon) is 2:37, showed a public trial in 2:31¼ at the same way of going, which demonstrates that he was above the average in point of trotting speed. The oldest of these mares has now reached the age of sixteen, while the youngest, with two to her credit, is only eight years old, so that it may reasonably be expected that in point of producing 2:30 or better speed more than one of them will eclipse any mare now in the books, as Sontag Mohawk already has seven to her credit. Two of these mares, Lucia and Sontag Mohawk, are the grandams respectively of Trapeze, 2:29½, and Starlight, 2:26½, the record of the latter having been made when she was two years old. Another interesting feature of this broodmare question is the fact that the youngest great broodmare that had a standard performer in the second generation is the developed trotter Mist, 2:29½, she by King Rene, 2:30½—developed speed for two generations. The logic of facts is inexorable, and facts are the only solid

Digitized by Google

foundation upon which the process of breeding up the trotting-horse can be safely conducted. As to the blood lines in the second generation of the male line of the mares given above it may be said that the dam of Onward was by Mambrino Chief, the dam of Jay Gould by Seely's American Star, the dam of Victor of unknown breeding, and the dam of Mohawk Chief by Toronto.

All the facts which grouped together form the history of the blood lines of these mares point as unerringly as the needle indicates the pole to the conclusion that, other things being equal, developed speed is a distinctly valuable quality in the pedigree of any horse, and that it is a quality which can not be ignored by breeders who are hoping for success.

Electioneer's Producing Sons.

SENATOR STANFORD was interviewed in Washington not long ago on the subject of his horses in general and the stallion Palo Alto in particular. As usual the California breeder was very enthusiastic and optimistic in his statements concerning what the trotters from the Palo Alto ranch would accomplish in the near future, and he is justified by the past in taking this rosy view of affairs. Unless Senator Stanford has been misquoted, he evidently has on hand some goods in the line of two-year-old trotters, which from present appearances eclipse anything which in the past his system of breeding has been able to produce, for he says, without any qualifications, that although Arion was a great two-year-old, as his record of 2:10¾ shows, he (Stanford) did not sell him until he was satisfied that he had on the ranch at least one other horse that as a two-year-old stood a good chance of beating the time made by Arion. It is understood that the animal referred to by Senator Stanford is the filly Rowena, by Azmoor, 2:20½, dam thoroughbred. Azmoor is by Electioneer and out of a thoroughbred mare, so that the filly is practically seven-eighths thoroughbred. As a yearling last summer she made a record of 2:37, and at that time it was no trick at all for her to outspeed Bell Bird, that subsequently reduced the yearling trotting record to 2:26¼. Rowena, however, went wrong and was thrown out of training, but is now in first-class health again and understood to be showing a world of speed. Of course if Rowena trots fast as a two-year-old, the advocates of close crosses of thoroughbred blood in trotting pedigrees will have a grand pow wow and scalp dance, just as they did when Palo Alto reduced the stallion record to 2:08¾, but after all what will it mean? It has been pointed out, time and again, in these columns that Electioneer is the sole and solitary example of a trotting stallion able to obtain any reasonable percentage of speed from strictly thoroughbred mares.

It doesn't make any difference how kindly the blood of Electioneer blends with that of the thoroughbred horse, or rather as some of the trotting blood extremists would put it, how completely Electioneer's blood wipes out that of the thoroughbred, the correctness of the position that thoroughbred blood in the near crosses of trotting pedigrees is a good thing, will not have been established until a considerable number of other horses have followed in the footsteps of Electioneer and sired speed from thoroughbreds as he has done. At the close of 1891 seventeen sons of Electioneer had sired forty-two trotters and two pacers with records which made them standard. These producing sons of Electioneer and the breeding of their dams are shown by the following table:

NAME.	Record.	Sire of Dam.	No. in List.
Alaska	.....	Son of G. M. Patchen Jr.	1
Albert W	2:20	John Nelson	2
Ansel	2:20	Lexington	3
Anteeo	2:16¼	A. W. Richmond	8
Bell Boy	2:19¼	The Moor	1
Chimes	2:30¾	The Moor	1
Clay	2:25	Henry Clay	1
Egotist	2:22¼	Belmont	1
Elect	.....	Nordale	1
Elector, 2170	2:31	St. Clair, 656	8
Elector, 10830	2:21¼	Whipple's Hambletonian	1
Eros	2:29½	Mohawk Chief	6
Fallis	2:23	Messenger Duroc	2
Norval	2:17½	Alexander's Norman	2
St. Bel	2:24½	The Moor	2
Sphinx	2:20½	Belmont	2
Whips	2:27½	Enquirer	2

In this list of the seventeen producing sons of Electioneer three are full brothers—Bell Boy, Chimes and St. Bel—all of whom are out of Beautiful Bells, a mare with a trotting record of 2:29½, and she in turn by The Moor, a stallion that had speed enough to make a record of 2:37 about twenty years ago. The dam of Beautiful Bells was the famous producer Minnehaha, a trotter, her dam being Nettie Clay, by Cassius M. Clay Jr., 22, which horse has a record of 2:35¼, and is the sire of three 2:30 or better trotters, nine producing sons, and twenty-two producing daughters. Two others of the producing sons of Electioneer are also brothers, they being Egotist and Sphinx, both out of a Belmont mare whose dam was Water-

Digitized by Google

witch, the famous producing daughter of Pilot Jr. Belmont was a horse of 2:30 speed, and a great sire. Pilot Jr. was a trotter, the sire of eight with records better than 2:30, seven producing sons and sixteen daughters that have produced thirty-four trotters, twenty-one of them with records better than 2:25, seven with records of 2:20 or better, and two with records of 2:10 or better. The other producing sons of Electioneer whose dams were by horses that are the progenitors of considerable trotting speed and whose blood lines in the main are of the trotting order, are Alaska, Clay, Elector 10830, Eros, Fallis and Norval. The dams of Albert W. and Anteeo were by horses with a considerable proportion of thoroughbred blood, while the dams of Ansel and Whips were sired by the thoroughbred stallions Lexington and Enquirer. The dam of Elector 2170, who, in point of ability to sire 2:30 speed stands on an equality with Anteeo, these two in this respect outranking all other sons of Electioneer, was by St.Clair, 656, a son of the pacer St. Clair, which horse got some trotting speed, and transmitted to his sons and daughters the power of producing speed at the trot.

But in order to form a thoroughly intelligent judgment as to the relative merits of these producing sons of Electioneer, it is necessary that their ages should be given, as of necessity the older horses in the list have had the greatest opportunity to sire speed. Their dates of birth were as follows:

NAME.	Foaled.	Number in List.	Age When First Performer Entered List.
Alaska	1878	1	12
Fallis	1878	2	11
Albert W	1878	2	13
Anteeo	1879	8	10
Clay	1879	1	12
Elector 2170	1879	8	10
Eros	1879	6	10
Ansel	1880	3	11
Elector, 10830	1880	1	9
Whips	1880	2	10
Norval	1882	2	9
St. Bel	1882	2	9
Sphinx	1883	2	8
Chimes	1884	1	7
Bell Boy	1885	1	6
Egotist	1885	1	6
Elect	....	1	..

This shows that seven sons of Electioneer are found not wanting when the supreme test of sireship is applied to the family—the ability to get a 2:30 performer before reaching the age of ten years. Let us see how these sons of Electioneer which come up to the highest test in the matter of speed-producing qualities are bred in the maternal line. Bell Boy and Egotist were represented in the 2:30 list at six years of age, and they are among the most intensely trotting-bred of the producing sons of Electioneer. Chimes, who was represented in the 2:30 list when seven years old, is a brother to Bell Boy and St. Bel, and Sphinx, whose get began trotting in 2:30 when he was eight years old, is a brother to Egotist. Norval and St. Bel were sires of 2:30 speed at nine years of age. The first-named is from a mare by Alexander's Norman, while St. Bel is a brother to Bell Boy and Chimes. Elector 10830, the remaining son of Electioneer to sire 2:30 speed before reaching the age of ten, is out of a mare by Whipple's Hambletonian. This demonstrates in an absolutely conclusive manner that when it comes to the early production of 2:30 speed the sons of Electioneer which have no near crosses of thoroughbred blood in their pedigrees are far in advance of such horses as Ansel and Whips, that are out of strictly thoroughbred mares, and also of Anteeo and Albert W., in whose veins the thoroughbred cross is close up. Of course it is not intended to in any way asperse or detract from the wonderful producing qualities of any son of Electioneer mentioned in this list, because there is not one of them that may not be fairly termed a remarkably successful sire, age considered, but the facts and figures are given simply as a matter of current interest.

And, before dismissing the subject, it should not be forgotten that of these seventeen sons of Electioneer that have sired 2:30 speed, thirteen have records of 2:30 or better, two others marks of 2:30¾ and 2:31, respectively, while Alaska and Elect are the only ones without records, and, in a recent letter to the editor of the MONTHLY, Mr. John W. Mackay, superintendent of the Haggin ranch, in California, where Alaska is owned, said that when that horse was being shaped up for a record he could show a 2:25 gait, but an ailing leg prevented his making an appearance in a race. There is left, therefore, only one of the seventeen producing sons of Electioneer concerning whose speed qualities nothing definite is known, that exception being Elect, and it is also worth noting that Nordale, the sire of Elect's dam, was a horse whose blood lines have not been established. Leaving out Alaska and Elect, we find that fifteen of the seventeen producing sons of Electioneer have records ranging from 2:31 to 2:16¼, and, in

Digitized by Google

some instances, such as Sphinx, Anteeo, Bell Boy and Chimes, these horses were above the average as colt trotters. The average record of these fifteen sons of Electioneer is 2:23¼. This showing is certainly a great argument on the side of those who pin their faith to developed sires, and it is also remarkable that Bell Boy, Egotist, St. Bel, Sphinx and Chimes, all of whom were fast trotters at three years of age, without exception have sired 2:30 speed before becoming ten years old, two of them having 2:30 representatives at six years of age, one at seven, and another at eight. This proves that in the Electioneer family, at least, the horses which trot early are also early sires of speed, and the whole showing on the subject of Electioneer's sons that have produced 2:30 speed is an interesting and instructive one.

An Interchangeable Gait.

THE Governor Sprague gelding, Charley P., that made a trotting record of 2:25½ five years ago, was then set to pacing, and at the latter gait last season won a heat in 2:16, has been put to trotting again and is expected to beat 2:20. He is already standard by a wide margin at both ways of going, and yet, so far as his blood lines are concerned, there is not much in them to indicate the possession of pacing speed, as his dam was by Rothschild, a son of Mambrino Patchen; second dam by Edwin Forrest. Charley P. will therefore have to be classed among the already large and rapidly increasing number of horses which make fast records at both the trot and the pace without any apparent reason for so doing, unless it be that they are anxious to demonstrate by actual performance on the race track the instability of the theory to which some people tenaciously cling, that the trot and pace are not interchangeable.

There are now at least a score of horses that have made records of 2:30 or better at both the trot and pace, and almost without exception they are trotting-bred—some of them intensely so. Direct, by a trotter with a record of 2:17, and out of a trotter with a record of 2:23½, paced in 2:06, and trotted in 2:18¼ at four years of age. Jewett, Mike Wilkes, Charley P. and others with pacing records better than 2:17, and trotting records better than 2:30, are what may be termed trotting-bred, and every season sees the advent into the list of a lot of horses that are speedy at both ways of going, it being however almost invariably the case that they can compass a mile faster at the pace than the trot, all of which goes to show that the former gait is the easier of the two. It has been claimed, and justly, that the question of whether trotting-bred pacers are the best, will not be determined until the production of pacers bred in pacing lines has been carried on for a considerable period of time, and force is given to this position by the fact that the Tom Hal family of pacers has produced in Hal Pointer, Brown Hal and others some of the fastest and gamest pacers on the turf. Taking extreme speed as a basis of comparison among pacers, it is very readily demonstrated that in the male line at least a large proportion of the performers falling within the prescribed limit are by trotting sires. Here is the list, which tells its own story. It comprises all pacers that have beaten 2:14:

Name.	*Record.*	*Sire.*
Direct	2:06	Director, 2:17.
Johnston	2:06¼	Joe Bassett.
Roy Wilkes	2:08¼	Adrian Wilkes.
Hal Pointer	2:09¾	Tom Hal Jr.
Cricket	2:10	Steinway, 2:25¾.
Goldleaf	2:11¼	Sidney, 2:19¾ (p).
Red Bell	2:11¼	Red Wilkes.
Adonis	2:11½	Sidney, 2:19¾ (p).
Dallas	2:11½	Almont Boy.
Manager	2:11½	Nutwood, 2:18¾.
Little Brown Jug	2:11¾	Tom Hal, Jr.
Guy	2:11¾	Shiloh.
Strong Boy	2:12	Allandorf.
Yolo Maid	2:12	Alexander Button, 2:26½.
Sleepy Tom	2:12¼	Tom Rolfe, 2:33½.
Brown Hal	2:12½	Tom Hal Jr.
Buffalo Girl	2:12½	Pocahontas Boy, 2:31.
Richball	2:12½	King Pharaoh.
Grant's Abdallah	2:12¾	Abdallah Bruce.
Mattie Hunter	2:12¾	Prince Pulaski.
Attorney Jr	2:13	Attorney.
Strathso	2:13	Strathmore.
Arrow	2:13¼	A. W. Richmond.
Bessemer	2:13¼	Voltaire, 2:20¼.
Gossip Jr	2:13¼	Gossip, 2:18 (p).
B. B	2:13½	Veto.
Budd Doble	2:13½	Indianapolis, 2:21.
Bunco Jr	2:13½	Bunco.
Major Wonder	2:13½	Major Edsall Jr.
Nightingale	2:13½	Alcantara, 2:23.
Flora Belle	2:13¾	White Cloud.
Fuller	2:13¾	Clear Grit, 2:42½.
Gem	2:13¾	Tom Rolfe, 2:33½.
Little Mac	2:13¾	Kentucky Dan.
Rowdy Boy	2:13¾	Bull Pup.
Westmont	2:13¾	Almont, 2:39¾.

In the above list of sires of these pacers with records better than 2:14, only three are marked in the Year Book with italics, designating them as pacers, these being Tom Hal Jr., who appears three times; Sidney, who appears twice, and Gossip. There are other sires in the list, however, which have strong pacing ancestry, Prince Pulaski being one of these, but on the other hand there is no more strongly trotting-bred stallion in the world than Sidney, who is by the developed trotter, Santa Claus, 2:17½, and out of the Volunteer mare

Digitized by Google

Sweetness, 2:21¼, her dam being by Edward Everett. Santa Claus' sire was Strathmore, so that Sidney is deeply inbred to Hambletonian 10. On the other hand it is only fair to assume that Tom Rolfe, who appears twice in the above list of sires, inherits his ability to transmit pacing speed from his dam, the celebrated pacer, Pocahontas, 2:17½, although Tom Rolfe himself has a trotting record of 2:33½, and it may be said in passing that all the records in the above list of sires, with the exception of that of Sidney and Gossip, were made at the trot, although some of the horses in the list, like Tom Rolfe, have a strong current of pacing blood in their veins, Indianapolis, 2:21, and Voltaire, 2:20¼, being conspicuous instances of this sort. The compilation is valuable, because it states only facts, which are what breeders can safely pin their faith to.

An Interesting List.

A CAREFUL study of the Year Book shows that 239 stallions are the sires of both trotting and pacing speed of the standard variety—that is 239 horses have sired one or more 2:30 trotters and 2:25 pacers. This fact being established, it occurred to the writer that a table giving the names of these horses and also the name and record of the fastest of the get of each at both the trot and pace would contain a good deal of valuable information. Consequently the table was prepared, after which, by the usual processes of arithmetic the records of the fastest of the get of each of these stallions at the trot and pace were manipulated so as to determine the average speed, and it was found that the average of the 239 trotters was 2:22, while the average record of the pacing representatives was 2:19 5-12. This shows that whenever a stallion has succeeded in siring standard speed at both the pace and trot the average in favor of the pacer is a little less than three seconds. There are of course some sires of very fast pacers that are not represented by any trotters in the 2:30 list, Allandorf, who got Strong Boy, 2:12 at four years of age, being an instance of this kind, and then again there are plenty of noted trotting sires that have never sired standard pacing speed, among this class being Abdallah Mambrino, Administrator, Bostwick's Almont, Altamont, Anteeo, Green's Bashaw, Bay Middleton, Gooding's Champion, Daniel Lambert, Florida, General Benton, General Knox, General Stanton, George M. Patchen, Godfrey Patchen, Rysdyk's Hambletonian, Wood's Hambletonian, Jay Bird, Jay Gould, Kentucky Prince, King Rene, Lord Russell, Mambrino Chief, Mambrino Patchen, Masterlode, Pilot Jr., Princeps, Robert McGregor and Woodford Mambrino. In the list which follows it will be found that in two instances the fastest trotter to the credit of a sire is also his fastest pacer, this being the case with Allie West, who is represented by Jewett, and Chieftain who holds the same relation to Defiance, both of these horses having gone fast at both the trot and pace. John C. Breckinridge, a horse whose pedigree is unknown, is also the sire of another performer of this sort, the bay mare, Minnie R., whose trotting record is 2:19, while her pacing mark is 2:16½. The Jay Gould stallion Bay State gets his fastest trotter and pacer out of the same mare, the trotter Grand Duchess, 2:26½, she being a daughter of Hanley's Hiatoga. In the same manner Blackwood Mambrino's fastest trotter and pacer are out of Lucy Woodruff, and Joe Bassett got his fastest trotter, Brother Dan, 2:23½, and his fastest pacer, Johnston, 2:06¼, from the same mare.

The table is as follows:

NAME.	Fastest Trotter.	Fastest Pacer.
Abe Downing.	Pat Downing, 2:13.	Chronometer, 2:15¾.

Electioneer and Thoroughbred Blood.

THE track at Meadville, Pa., which has been leased by Miller & Sibley and improved so that it now ranks with any race course for trotters in the world, is Marvin's headquarters, the great reinsman having recently purchased a residence in Meadville, where he will make his permanent home. Of course everything done by Marvin in regard to young trotters is closely watched by Pennsylvania people just now, and already the talk is that among the young things by St. Bel and others of Miller & Sibley's stallions, he has a yearling that is liable to become a wonder, unless the estimate Marvin has formed of her is an incorrect one. She is called Dellabel, her dam being a daughter of the trotter Hambrino, 2:21¼, and as the filly's sire, St. Bel, took a record of 2:24½ as a four-year-old and was by Electioneer and out of the great broodmare Beautiful Bells, 2:29½, it will be seen that the first yearling trotter of 1892, that is talked about as having a chance to lower the mark of 2:25¼ set by Frou Frou last fall, is bred in what may be fairly termed intense trotting lines.

It will hardly be questioned that St. Bel, the sire of this filly, was a trotting-bred trotter,

Digitized by Google

although we notice that an eastern writer, who has a fancy for going back to remote thoroughbred crosses in pedigrees of fast harness horses and claiming it is from this source that the trot originates, has been performing the operation in the case of Beautiful Bells, taking exception to the statement made in these columns that she was "intensely trotting-bred." The exact amount of influence, good or otherwise, which the possession of thoroughbred blood by the great-grandmothers or great-great-grandfathers of celebrated trotters of the present day can not of course be accurately determined, but although it is true that from a strictly thoroughbred mare has come the stallion Palo Alto, 2:08¾, and that another mare whose dam was thoroughbred produced Sunol, 2:08¼, it is nevertheless a fact, the significance of which must not be underestimated and can not be ignored, that in each instance the sire of this extreme trotting speed was Electioneer, a horse who, in respect of ability to control and fix action in his progeny, has had no equal in the equine world. That the advocates of close thoroughbred crosses in trotting pedigrees have had their side of the case ably championed of late and sustained in telling fashion by the performances of the get of Electioneer in whose veins the blood of the race horse is prominent is not to be denied, but is also true that Palo Alto is the only instance in which Electioneer sired a trotter with a record better than 2:20 out of a thoroughbred mare. On the other hand it is not possible for any person who beholds that peerless trotter, Sunol, to remain blind to the fact that in conformation and some phases of temperament she is almost an ideal thoroughbred, so that from whichever point of view on this subject the observation is taken, there arise facts on each side of the question which can not be talked down or sneered away. A very interesting article by Mr. Joseph Cairn Simpson printed in these columns last month threw a flood of light on the question of Electioneer's prepotency, when that stallion was mated with thoroughbred mares, and although Mr. Simpson, who is an avowed enthusiast on the subject of running blood in trotting pedigrees, views the revelations which his tireless energy has made from his own standpoint, he will doubtless perceive and admit that while his researches have developed the fact that running blood has, in the case of one horse at least, proved, if not a potent factor in the production of trotting speed at least no detriment to its success, thus far the practicability of a general application of the principles of breeding which have succeeded so well in the case of Electioneer and thoroughbred mares has not been shown to be even a possibility so far as other stallions are concerned.

In other words, just as Electioneer has been a marvel among trotting stallions when bred to trotting and pacing mares, he has also been equally a phenomenal success in respect of getting speed from dams in whose veins the blood of the thoroughbred race horse was prominent. With Palo Alto placed to the credit of the trotters of extreme speed that have come from thoroughbred mares, that chapter of the story is at an end. On the other hand, Sunol, the fastest trotter in the world as well as the fastest one to the credit of Electioneer, had for a dam a mare by the trotter, General Benton, whose public mile in 2:20½, over the Utica, N. Y., track, is well established and as much a matter of turf history as though it had been made in a race against other horses. General Benton can be considered only as a 2:20½ trotter, no matter whether the official evidence of his speed is at hand or not. Arion, 2:10¾ as a two-year-old, and beyond question the most sensational trotting horse ever seen, was from a mare by the trotter Nutwood, 2:18¾, while Manzanita and Wildflower, who at one time and another held the four and two-year-old trotting records of the world, were from a trotting mare whose record was only a fraction of a second slower than 2:30, she being sired by the pacing stallion St. Clair. It is true that these facts have been stated many times and dwelt upon at length in these columns, but there can hardly be a superabundance of reiteration upon a point that is manifestly of such vital interest to breeders of the light-harness horse. The blood of Electioneer has not only blended kindly with thoroughbred strains, but it has also produced from thoroughbred mares a far greater proportion of trotting speed of the standard variety than has been obtained in other instances, where a close infusion of race horse blood has been made in the pedigree of animals sired by trotting stallions and bred in the hope of their becoming fast trotters. The question as to how many and how close shall be the thoroughbred crosses in trotting pedigrees is an open one. In the case of the blood of Electioneer there has been a kindly blending of two strains that if left to themselves unquestionably produce two radically different types of horses, and

Digitized by Google

while it is not by any means certain that other branches of the great trotting family (that of Hambletonian) will be able to repeat in this particular the success of Electioneer and his sons, it is still true that what the California stallion and his descendants have accomplished in this line has already proven itself of the greatest value to the breeding interest generally.

Fred C. Pillsbury.

Among the many great losses the trotting and breeding interests of the country have sustained within the past twelve months, at the hands of death, it is our sad duty to chronicle the demise of Mr. Fred C. Pillsbury at his home in Minneapolis, on the 15th of May, of malignant diphtheria.

Mr. Pillsbury had lately returned home from a three-days meeting of the Board of Appeals of the American Trotting Association held in this city, of which he was a member. Though one of the youngest members of the board, he did good work in that connection. While a strict disciplinarian and an advocate of high moral principles, in all matters relating to the turf as well as to other affairs of life, his generous disposition and love of his fellow-man naturally arrayed him on the side of misguided offenders, but his sense of justice was so keen that he never permitted his sympathies to sway his judgment. He was always true to himself and to his trust. Mr. Pillsbury was one of the charter members of the American Trotting Association, and at the time of his untimely death one of its directors; had been president of the Minnesota State Agricultural Society, and was a director of the Minnehaha Driving Park Association, and a stockholding member of the American Trotting Register Association.

Passionately devoted to the light-harness horse, he naturally took a great interest in his track performances, and was the owner of a number of standard animals on his breeding establishment at Lake Minnetonka. His ample means enabled him to gratify this passion and make a fine collection of paintings, in which his love of the beautiful in art made him a competent judge.

Mr. Pillsbury was a singularly handsome man, as will be seen by the frontispiece in this number, but the engraver's art is inadequate to portray the beauty and soul of his deep blue eye, that lighted up his countenance with the radiance of honor, truth and nobility.

As much as he will be missed in the business affairs of life, the void is not to be compared to the loss sustained by his legion of friends, who will know the genial companion and true friend, Fred C. Pillsbury, no more forever.

Notes and News.

Mr. M. Solovief, the agent of the Russian government, will leave for Palo Alto Farm about June 7, to select the two mares and one stallion that go to Russia in exchange for the Orloff mares and stallions. Mr. Solovief will accompany the stock to Russia and will return with the consignment to Senator Stanford. He will also visit this country next year in charge of the Russian exhibit of horses at the World's Fair.

Mr. Solovief likes this country, and he will probably visit a number of noted farms before he leaves for home. We have gained much information from him regarding Russian turf matters. The betting there is conducted much on the plan of our mutuels. Tickets are sold at ten roubles each and a better may buy as many on any one starter as he chooses. When the race is started the sum or aggregate of all tickets sold is computed, and 10 per cent is deducted for the association. When the race is decided, the balance of the money is divided into as many equal parts as the number of tickets sold on the winner, and this regulates the value of each winning ticket.

Cyrus Lukens, Philadelphia, Pa., racily relates the following amusing tale: "Among my varied experiences of the past thirty years the following wins the first premium. Last fall a young novice requested me to tabulate the pedigree of a non-standard stallion that he had recently purchased. After a very persistent effort the animal was identified. His breeder was found, as well as the breeders of both his first and second dams. Finally the entire history was in excellent tabulated form, with all of the uncles, cousins and the aunts who had done honor in the 2:30 list thrown in, and the youthful aspirant for local stud-horse prestige in a country town thirty miles west of this city was in high spirits over the success that had at last seemingly crowned our efforts —when suddenly he rushed in to see me, and with a very cautious, careworn expression, said very quietly and despondingly: 'If you have not printed that tabular form, I guess you might as well stop where you are.' 'Very well,' said I, 'but it is all in type and here is

Digitized by Google

the proof. As that stallion has had almost all of the misfortunes happen to him that ever fell to the lot of poor brutes, except that of death, what has happened to him now. Is he dead?' 'No,' he said, slowly and cautiously, 'he is not dead, but my brother went up to the farm the other day to castrate a couple of colts and they cut the stud by mistake.' Trying to condole the poor fellow, I said, 'Oh, well, you can drive him now; he will make a nice gelding.' 'Oh, no!' said he, 'I can not because he is deaf.'"

MR. T. W. MOORE, of New York, claims that his invention, the equine bicycle, not only relieves the horse of the weight of the rider, but runs so easily as hardly to impede his speed. In no other way yet known can the rider or driver be carried with so little tax upon the horse's strength or power of endurance. The location of the wheels along the sides and flanks of the horse avoids the friction on the curves of the turns.

A TEXAS railroad has just paid $2,500 for the trotter, Florence M., 2:22¼, that was killed in an accident last season.

MAMBRINO ARCHY, 2:24¾, is back in Vermont, after a trip to the Argentine Republic.

THE dam of Lockheart, 2:14¾, is to be bred to Nutwood, with the idea of getting a brother or sister to Lockheart.

IN John Dickerson's stable at Terre Haute there are trotters and pacers by fourteen sons of George Wilkes.

WILLIAM RYSDYK, a son of Rysdyk's Hambletonian, is still getting colts, although thirty-one years of age.

A TWO-year-old filly by Stamboul, 2:11, dam Trinket, 2:14, is to be sent East to John Turner, who will develop her. During Turner's trip to California last winter he saw the filly, was much pleased with her, and intimated that inasmuch as he had given her dam her record of 2:14, he would like to try his hand on the daughter. When Trinket went into Turner's hands she was rather under a cloud, as after trotting as a four-year-old in 2:19¾, being the first horse of that age to beat 2:20, she did not improve very much and was unsettled in her gait. In Turner's hands, however, she developed into a great race mare, and when she was in shape it took about the best horse on the turf to lead her to the wire three consecutive heats.

YORKTOWN BELLE, 2:20½, and the pacer, Elva Medium, 2:18¼, are to be bred to Happy Russell, 2:21½.

MRS. C. R. NOYES, a Boston lady who breeds trotters as a pastime, recently had foaled by her mare, Mariette, a colt by Nelson, 2:10, The youngster carries in his veins the blood of thirteen mares found in the table of Great Brood Mares.

RARUS, the big bay gelding that at the summer trotting meeting at Buffalo in 1878 lowered the trotting record to 2:13¼, where it stood secure until a little more than a year later, when St. Julian made himself famous by trotting the first mile better than 2:13, died the other day in Mr. Robert Bonner's ownership, at the age of twenty-five. The story of Rarus reads like a romance. He was bred by R. B. Conklin, a New York stage carpenter who had a little farm on Long Island, whither he retired in the autumn of life. A fondness for horses led him into breeding on a small scale, and having noticed hitched to a butcher's wagon a bay stallion that took his fancy, Mr. Conklin bought him. Of the breeding of this stallion nothing is known, and his name, Conklin's Abdallah, signified nothing so far as his blood lines were concerned. Mating him with Nancy Awful, a mare in whose veins there was a good deal of the blood of the thoroughbred, there was produced a colt which afterward became famous as Rarus. Never was young horseflesh better cared for than Mr. Conklin's colt. The old man had firm faith, from the day of its birth, that Nancy Awful's colt would prove a great trotter, and right royally were his hopes and confidence rewarded. A local trainer named Page gave the colt his early lessons in trotting, and by the time he was five or six years old there was speed enough in sight for a 2:30 gait, which meant much more in those days than now. Finally, after quite a career on the turf in point of time, but not brilliant in the way of success, Rarus fell into the hands of John Splan, who gradually reduced his record until it stood better than that of any other trotter, and the following season Rarus was sold to Mr. Bonner for $36,000.

THE foals at the Hickory Grove stock farm, Racine, Wis., are coming in good shape this season, and without exception they are reported to be fine individuals. Among them is a sorrel filly by Phallas, her first and second dams being respectively by Onward and Cardinal, while her third dam is the famous Pilot

Digitized by Google

Jr. mare, Crop, that produced three in the 2:30 list. Lexington Wilkes is represented by a bay colt out of Waterlily, the Hero of Thorndale mare, that produced Wimbledon, 2:29½; third dam Waterwitch. He also has a bay filly out of Phallas Queen by Phallas, she being the dam of Arion, two-year-old record 2:52.

THAT interesting foundling, the National Trotting Stud Book, fathered by the terrible Mr. Packer, secretary and general factotum of the National Association of Trotting Horse Breeders, expired of inanition a few days since. Obituary notices, which included a brief but eloquent eulogy of the deceased, were sent out by its bereaved parent, and the spartan manner in which Mr. Packer conceals his grief is really pathetic. It seems that the Executive Committee of the National Association of Trotting Horse Breeders, noticing that Mr. Packer's infant phenomenon was dead, concluded that it might as well be buried formally and with all the honors due its official parentage. Consequently they held a meeting, took action to the extent of four whereases and one resolve, and the deed was done. Really, Mr. Packer should be glad that the unpleasant job was kindly taken off his hands, as he has had trouble enough over the infant. Loss of membership to the National Association of Trotting Horse Breeders is all it accomplished in this world, and as Mr. Packer has a sordid interest in keeping the roll of that organization up to the highest possible notch, the demise of an infant which was rapidly decimating its ranks is not so absolutely distressing as would otherwise be the case.

Questions and Replies.

C. M. N., OCHRE, VA.—1. Enclosed find pedigree of Dandy, claimed to be thoroughbred, is it correct? 2. Do you know anything of his racing career or the time he claims to have made?

ANSWER.—Dandy is not registered in the American Thoroughbred Stud Book, nor is his reputed sire Conservator or Conervaton by Hampton, hence we can not say if correct or not, but it is certainly open to suspicion. 2. We know nothing of the racing career of Dandy.

L. T., TORONTO, ONT.—1. Can you give me any information of a mare said to have been sired by Black Bashaw 782, and to have run a five-mile race at Walkerville, Ont., against Butcher Boy for a wager of $1,000. Time 13:08, date somewhere in the sixties? 2. Give address of owners of Western Fearnaught 941.

ANSWER.—1. Without the name of the mare to start with it is almost impossible to trace her pedigree or performances, we can find no record of the race referred to. 2. Bred 1864 by John Bragdon, bought at two years of age by B. S. Wright and kept at Romeo and Pontiac, Mich.; bought 1880 by William R. Nims, Lexington, Mich.; last recorded owner John Axford, Oxford, Mich.

G. H. B.—Where can I address a letter to Charles Green, driver and owner of trotters?

ANSWER.—Charles S. Green, Utica, N. Y.

J. G. O., PACKWOOD, IOWA.—Of two horses named in my letter which do you consider best and most fashionably bred?

ANSWER.—The second horse named, by son of Almont, dam by Dictator, etc.

R. W. R., CANTON, MO.—Please give number of trotters and pacers which entered the 2:30 list in 1891?

ANSWER.—On January 1, 1892, there were 5,908 trotters in the 2:30 list against 4,614 on January 1, 1891. The reduction in the pacing standard of performance from 2:30 to 2:25 during the past year, makes it impracticable to give the present number of 2:30 pacers. There were on January 1, 1892, 894 pacers with a record of 2:25 or better. On January 1, 1891, there were 1,251 pacers with a record of 2:30 or better.

C. M., SOUTH BLOOMFIELD, OHIO.—What is Butternut's three-year-old record and where made?

ANSWER.—Butternut, ch c, by Walnut, made a record of 2:38¼ in three-year-old class at Lima, Ohio, July 8, 1891, his best recorded time.

H. G. B., CHANUTE, KAS.—1. Is there any horse recorded by name of Scott Chief? 2. Where was Clark Chief, 89, bred, and by whom? 3. Are there any other Clark Chiefs recorded?

ANSWER.—1. There is one stallion and one gelding recorded as Scott or Scott's Chief in the American Trotting Register—viz.: b g by Edwin Forrest; dam Lady Rice, by Whitehall; record 2:23, and b h, by Egmont; dam Lou Scott, by Dye's Woodford, record 2:28—none others. 2. Bred by Enoch Lewis, near Lexington, Ky., foaled 1861. 3. Yes, several, viz.: Clark Chief, b h foaled 1875, by Confederate Chief;

Digitized by Google

Clark Chief Jr. (Montana) 3002, b h foaled 1866, by Clark Chief 89; Clark Chief Jr. (Sims), 2110, b h foaled 1870, by Clark Chief 89, and Clark Chief Jr. (Campbell's), 3515, b h foaled 1852, by Clark Chief.

O. J. L., WENONA, ILL.—Give name, color, age, breeding and present owner of standard horse No. 4472.

ANSWER.—No. 4472, Forrest Chief, b h foaled 1884, by Egmont 1828; dam Madame Forrest, by Edwin Forrest 49; second dam by Brown Dick, son of imp. Margrave. Bred by Nat Bruen, La Harpe, Ill., his last recorded owner.

W. B., NEW CASTLE, PA.—I have a filly two years old I want to breed. 1. Will she produce as good a foal at two years old as she would at three? 2. Does it injure a filly to breed her at two years old?

ANSWER.—If the filly is well grown and reasonably mature for her age it will do her no injury to breed her at two years old, and if she is well kept and not worked or trained the produce should be as good as if bred at three years old. A filly bred at two years old should not be worked in any way, as to grow properly and carry a foal is a sufficient tax on her physical powers at that age.

W. M. K., VAN WERT, OHIO.—Give number and breeding on dam's side of Brigham, by Hambletonian 10—a standard or registered horse.

ANSWER.—There is no horse named Brigham, by Hambletonian 10, registered or recorded in the American Trotting Register, either as standard or non-standard.

MANY BREEDERS.—Is Uncan, b h foaled 1888, by Harper 3560; dam Mag, by Dick Coleman; second dam by Potomac; third dam by Red Line, either standard or standard bred?

ANSWER.—No. Uncan is not registered, nor is he eligible to registration either as standard or non-standard according to pedigree given.

SUBSCRIBER, KANSAS.—The pacing stallion, Riley Medium 2150, owned by R. C. Campbell, of Ottawa, Kas., is being advertised as the sire of three 2:30 performers, viz.: Nina Medium, 2:25, at Abilene, Kas.; Orelian, 2:29¼, at Emporia, Kas., and Durelle, 2:29, at Bonham, Texas. Is this correct?

ANSWER.—No. Riley Medium has only two 2:30 performers, viz.: Nina Medium, 2:25, trotting, and Aurelian (not Orelian), 2:29¼, pacing. Durelle has no record; his only published performance is at Bonham, Texas, September 22, 1891, in a pacing race in which he won no heat. Any statement to the contrary is fraudulent.

A. A. T., MANITOBA.—Are the following horses standard or standard bred? 1. Golden Age. 2. Sharper. 3. Volunteer Clay. 4. Western Wilkes. 5. Wildmont. Give sire and dam of each.

ANSWER.—1. Not registered or recorded; do not know breeding. 2. There are two standard horses registered as Sharper; No. 1524, b h foaled 1880, by Smuggler 927; dam Coquette, by American Clay 34, and No. 7001, ch h foaled 1882, by Bourbon Wilkes 2345; dam Lucy Sharp, by Joe Downing 710. This horse is owned in Manitoba. 3. Yes, No. 1600, b h foaled 1880, by Harry Clay 45; dam Voluntary, by Volunteer 55. 4. Yes, No. 4566, b h foaled 1884, by Favorite Wilkes 3257; dam Lucy Dingman, by Hailstorm 813. 5. Yes, No. 2271, br h foaled 1880, by Egmont 1828; dam Advance, by Administrator 357. There are no other horses of the names mentioned, standard and registered.

Our New Advertisers.

THE Wayne Sulkyette and Road Cart Company present a new and attractive advertisement of their justly celebrated vehicle in this issue. The Sulkyette is worthy of close examination by trainers and drivers, combining, as it does, special features and advantages claimed by no other manufacture.

THE advertisement of the Ripans Chemical Co., 10 Spruce St., New York, sets forth very fully the advantages of their reliable remedy for the purifying of the blood, etc. It is pleasant, safe, effectual.

THE Bonfield Detective Agency, 120 to 124 La Salle St., Chicago, is a thoroughly reliable establishment, conducted by experienced and competent men. They make a specialty of horse matters.

The Standard.

AS REVISED AND ADOPTED BY THE AMERICAN TROTTING REGISTER ASSOCIATION, APRIL 6, 1892.

THE TROTTING STANDARD.

In order to define what constitutes a standard-bred trotting horse, and to establish a BREED of trotters on a more intelligent basis, the following rules are adopted to control admission to registration. When an animal meets the requirements of admission and is duly registered, it shall be accepted as a standard-bred trotting animal.

FIRST. Any Trotting Stallion that has a record of two minutes and thirty seconds (2:30), or better; pro-

Digitized by Google

vided any of his get has a record of 2:35 trotting, or better; or provided his sire or dam is already a standard trotting animal.

SECOND. Any mare or gelding that has a trotting record of 2:30, or better.

THIRD. Any horse that is the sire of two trotters with records of 2:30, or better.

FOURTH. Any horse that is the sire of one trotter with a record of 2:30, or better; provided he has either of the following additional qualifications: 1. A trotting record of 2:35, or better. 2. Is the sire of two other animals with trotting records of 2:35. 3. Has a sire or dam that is already a standard trotting animal.

FIFTH. Any mare that has produced a trotter with a record of 2:30.

SIXTH. The progeny of a standard trotting horse when out of a standard trotting mare.

SEVENTH. The female progeny of a standard trotting horse when out of a mare by a standard trotting horse.

EIGHTH. The female progeny of a standard trotting horse when out of a mare whose dam is a standard trotting mare.

NINTH. Any mare that has a trotting record of 2:35, or better, whose sire or dam is a standard trotting animal.

THE PACING STANDARD.

In order to define what constitutes a standard-bred pacing horse, and to establish a BREED of pacers on a more intelligent basis, the following rules are adopted to control admission to registration. When an animal meets the requirements of admission and is duly registered, it shall be accepted as a standard-bred pacing animal.

FIRST. Any Pacing Stallion that has a record of two minutes and twenty-five seconds (2:25), or better; provided any of his get has a record of 2:30 pacing, or better; or provided his sire or dam is already a standard pacing animal.

SECOND. Any mare or gelding that has a pacing record of 2:25, or better.

THIRD. Any horse that is the sire of two pacers with records of 2:25.

FOURTH. Any horse that is the sire of one pacer with a record of 2:25, or better, provided he has either of the following additional qualifications: 1. A pacing record of 2:30, or better. 2. Is the sire of two other animals with pacing records of 2:30. 3. Has a sire or dam that is already a standard pacing animal.

FIFTH. Any mare that has produced a pacer with a record of 2:25, or better.

SIXTH. The progeny of a standard pacing horse when out of a standard pacing mare.

SEVENTH. The female progeny of a standard pacing horse when out of a mare by a standard pacing horse.

EIGHTH. The female progeny of a standard pacing horse when out of a mare whose dam is a standard pacing mare.

NINTH. Any mare that has a pacing record of 2:30, or better, whose sire or dam is a standard pacing animal.

TENTH. The progeny of a standard trotting horse, out of a standard pacing mare, or of a standard pacing horse, out of a standard trotting mare.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal*. The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ABERDINA, (6) br m foaled 1892; by Wilton 5982; dam Suggestion, by Onward 1411; g d Nashville (dam of Trumpeter, 2:23¼), by Woodford Mambrino 345, etc. [See Suggestion, Vol. VI.] Bred by C. H. Turner, Pekin, Ill. [Vol. XI.]

ANTIC, (7) b m foaled 1891; by Nugget 1398; dam Antares, by Ambassador 1496; g d White Girl, by Judge Evans, son of Hambletonian 10, etc. [See Antares, Vol. VI.] Bred by John McNeal, Iberia, Ohio. [Vol. XI.]

ARONA, (6) ch m foaled 1887; by Hermit 3923; dam Mississippi Maid (dam of Albani, 2:29½), by Anglo Saxon (Croach's), etc. [See Mississippi Maid, Vol. X.] Bred by James Warren, Carleton Place, Ont., Can. [Vol. XI.]

ARPALLO 19313, (6) b h foaled 1891; by St. Gothard 1518; dam Alicia, by Harold 413; g d Alice West, 2:26 (dam of Alencon, 2:28¼, etc.), by Almont 33, etc. [See Alicia, Vol. V.] Bred by S. C. Wells, Le Roy, N. Y. [Vol. XI.]

AUNT AUGUSTA, (6) b m foaled 1891; by Sphinx 5343; dam Belle Noble, 2:32¼, by Masterlode 595; g d Lady Forrester (dam of Larkin, 2:30), by Royal George 83, etc. [See Belle Noble, Vol. IX.] Bred by F. A. Baker, Detroit, Mich. [Vol. XI.]

BELAMY 19175, (6) b h foaled 1891; by Saint Bel 5336; dam Sis Nutwood, by Nutwood 600; g d Pilot Lady, by Pilot Jr. 12, etc. [See Sis Nutwood, Vol. VII.] Bred by J. E. French, Cleveland, Ohio. [Vol. XI.]

BELFIELD 19602, (6) b h foaled 1891; by Saint Bel 5336; dam Ara, 2:29¼, by Masterlode 595; g d Fanny, by Magna Charta 105, etc. [See Ara.] Bred by D. W. Caldwell;

Digitized by Google

passed to J. E. French, Cleveland, Ohio. [Vol. XI.]

BELLE ARCHER, (5) bl m foaled 1868; by Fred Pierson, son of Henry Clay 8; dam Flora, pedigree not traced. Bred by Charles Waker, Chili, N. Y.; passed to I. N. Wright; then to Robert W. Archer; then to George W. Archer, Rochester, N. Y. Dam of Brookie, 2:29¼. [Vol. XI.]

BELLE OF WYOMING, (6) b m foaled 1891; by Orange Chief 4514; dam Minnie, by William M. Rysdyk 5703; g d by Champion 807, etc. [See Minnie.] Bred by James Hicks, Wyoming, Pa.; passed to A. T. Daniels, Topeka, Kas. [Vol. XI.]

BIRTHDAY, (7) bl m foaled 1891; by Fortissimo 5835; dam Rose D., by Berbrino 5512; g d Jenny Lee, by Black Hawk (Bull's), son of Rolling Rock, etc. [See Rose D., Vol. III.] Bred by John Newman, Elgin, Ill.. [Vol. XI.]

BITHER 19518, (6) b h foaled 1892; by Kremlin 13327; dam *Kantaka*, 2:27½, by Bay State 5498; g d Deceitful, 2:34, by Garibaldi, son of Drew Horse 114, etc. [See Kantaka, Vol. VI.] Bred by G. B. Cogswell, North Easton, Mass. Vol. XI.]

BLACK CRICKET, (7) bl m foaled 1886; by Baymont 1027; dam Lady May, by Buckingham 1743; g d Bet Shutter, by Young Kentucky Star. Bred by N. Rombaugh, Hull, Iowa. [Vol. XI.]

BONDHOLDER 19176, (6) b h foaled 1891; by Saint Bel 5336; dam Nuttallite, by Nutbourne 1399; g d Katie K., by Idol, 44, etc. [See Nuttallite, Vol. VI.] Bred by J. E. French, Cleveland, Ohio. [Vol. XI.]

BROOKIE, (2, 6) b m foaled 1884; by Knickerbocker 200; dam Belle Archer, by Fred Pierson, son of Henry Clay 8; g d Flora, pedigree not traced. [See Belle Archer.] Bred by George W. Archer, Rochester, N. Y. Record 2:29¼. [Vol. XI.]

BROWN BOY 19507, (6) br h foaled 1887; by Vandal Wilkes 16584; dam Fanny G., by Star Almont 6673; g d Peggy, by Edwin Forrest 49. [See Fanny G.] Bred by G. N. Cassell; passed to Henry Graff; then to E. B. Glasscox, Lexington, Ky.; then to Powell Bros., Shadeland, Pa.; then to J. K. Arnold, Copley, Ohio. [Vol. XI.]

CHELTENHAM PRINCE 19427, (6) b h foaled 1891; by Cheltenham 5579; dam Princess D., by Hambletonian Prince 819; g d. Gipsey Girl, by Victor 937. [See Princess D., Vol. IX.] Bred by F. L. Crane, Scranton, Pa. [Vol. XI.]

CLARK CHIEF 19308, (4) b h foaled 1875; by Confederate Chief 423; dam Doll, by Andy Johnson 39. Bred by Silas W. Spink, Milo Centre, N.Y.; passed to Mary A. Spink, Dundee, N. Y. Record 2:31¼. Sire of Fleety L., 2:30. [Vol. XI.]

APPENDIX TO TROTTING REGISTER.

ANIMALS NOT STANDARD.

NOTE.—Copies of pedigrees from the non-standard department of any volume of the Register will be published here on the same conditions as stated at the head of "Standard Animals." Under the current rules, the following are eligible to entry in the Register as non-standard: 1. Mares, fillies and geldings by standard horses. 2. Animals that are historical and worthy of preservation. Stallion colts can not now be registered unless they possess two standard crosses.

BELLE, gr m foaled 1887; by Belford 14128; dam not traced. Bred by J. L. Harris, New Orleans, La.; passed to D. W. Pipes, Clinton, La. [Vol. X.]

BEN KIRTON, b h foaled 1888; by Narragansett 16789; dam Libbie K., by Toronto Chief Jr. 7683; g d Kitty Grey, pedigree not traced. Bred by John Kirton, Wick, Ont., Can.; passed to C. W. Johnson, Chicago, Ill. [Vol. XI.]

BLACK STAR, bl m foaled 1888; by Star of the West Jr. 18913; dam Dolly, pedigree not traced. Bred by Clifford R. Tanner, Watertown, S. Dak.; passed to L. H. Robinson, Chicago, Ill. [Vol. XI.]

HELEN BATCHELDER, b m foaled 1890; by Mambrino Duke 17786; dam Alice Ring, by Ringmaster, son of Ringgold; g d Fanny, by Cassius M. Clay Jr. 22; g g d Rogers Mare, pedigree not traced. Bred by William S. Krebs, Albert Lea, Minn. [Vol. XI.]

MISS GRAUNIA, b m foaled 1891; by Kildare 6594; dam Laura Grinstead, by Gilroy; g d Kitty Forrest, by Edwin Forrest 49; g g d Kitty Kirkman, by Canada Chief (Fanning's), etc. [See Kitty Kirkman, Vol. II.] Bred by J. E. French, Cleveland, Ohio. [Vol. XI.]

SAINT BRIDGET, b m foaled 1890; by Kildare 6594; dam Laura Grinstead, by Gilroy; g d Kitty Forrest, by Edwin Forrest 49; g g d Kitty Kirkman, by Canada Chief (Fanning's), etc. [See Kitty Kirkman, Vol. II.]

Digitized by Google

Bred by J. E. French, Cleveland, Ohio. [Vol. XI.]

WHITE STAR, bl m foaled 1888; by Star of the West Jr. 18913; dam Nell, pedigree not traced. Bred by James Ball, foaled the property of M. Jewett; passed to Samuel Sheldon, Watertown, S. Dak.; then to L. H. Robinson, Chicago, Ill. [Vol. XI.]

Zuma, b m foaled 1882; by Tom Hal 16934; dam Laura, pedigree not traced. Bred by C. Brown, Casters Creek, Tenn.; passed to J. M. Carter; then to Campbell Brown, Spring Hill, Tenn.; then to Rundle & White; then to J. M. Ives, Danbury, Conn. [Vol. XI.]

RECORD OF OFFICIAL TRANSFERS.

NOTE.—When registered animals change owners the transfer may be recorded here and will be carried into the next volume of the Register, thus maintaining the identity of the animal with the new ownership. The fee is twenty-five cents.

ABDALLAH ECLIPSE, b h foaled 1870; by Erie Abdallah 129; dam (dam of Erie Maid), by Bolton Eclipse. [See Vol. V., page 295.) Passed to John E. Beck, Navarre, Ohio; then to S. P. Welch, East Liverpool, Ohio.

ALBEIT 10266, (6) b h foaled 1887; by Cornelian 1085; dam All Bay, by Pocahontas Boy 1790, etc. [See Vol. VIII.] Passed to John P. Parker, Maroa, Ill.; then to Herbert Robbins, Fillmore, Minn.

Bacon 6322, (1, 6) b h foaled 1885; by Ajax 40, dam Polka (dam of Amberlon, 2:27¼), by Pocahontas Boy, 1790, etc. [See Vol. VII.] Passed to F. J. Berry, Chicago, Ill. Pacing record 2:23.

BESS, (7) b m foaled 1886; by Antipas 3685; dam Belle, by Bellfounder 63. [See Vol. VII.] Passed to Mrs. J. G. Wightman, Elroy, Wis., April, 1891.

BESSIE V., (6) ch m foaled 1876; by General Hatch 139; dam Dolly (dam of Envoy, 2:28, Fleta, 2:28, and *Attorney Jr.*, 2:13), by Iowa, son of imp. Glencoe, etc. [See Vol. X.] Passed to Henry Plumb, Des Moines, Iowa, February 12, 1892.

BLANCHE, b m foaled 1880; by Hermes 548; dam not traced. [See Vol. X.] Passed to H. A. Nolte, Milwaukee, Wis.

BLAZE, (7) b m foaled 1890; by Elbertie 9396; dam Lady Probert, by Pompadour 4593, etc. [See Vol. IX.] Passed to H. Isreal, Damascus, Ohio.

BOATSWAIN 3394, (6) b h foaled 1890; by Decorah H ·5577; dam Prism, by Chatham 3125, etc. [See Vol. IX.] Passed to Walter Smith, Nashua, Iowa.

BRADAMOUR 12845, (6) b h foaled 1890; by Blackwood Medium 2139; dam Empress, by Empire 2378, etc. [See Vol. IX.] Passed to George S. Cross, Rantoul, Ill. April 4, 1892.

CHERRYSTONE 6948, (7) b h foaled 1878; by Blackstone 72; dam Nell Packard, by Darkey 825, etc. [See Vol. VII.] Passed to E. R. Brayton, Alburgh Centre, Vt.; then to R. W. Goodrich, Poultney, Vt.; then to E. A. Fox, Ways' Mills, P. Q., Can.

CHILOWEE, (6) b m foaled 1889; by Jersey Wilkes 2516; dam Gladys, by Hambletonian 157, etc. [See Vol. X.] Passed to G. C. Astle, Prairie Du Sac, Wis.

DAISY SPRAGUE, (7) ch m foaled 1890; by Badger Sprague 1087; dam Daisy Noble, by Masterlode 595. [See Vol. X.] Passed to T. J. Gleason, Van Wert, Ohio, April 13, 1892.

DARA, (6) b m foaled 1883; by Sorrento 2164; dam Senorita, by Bona Fide 720, etc. [See Vol. V.] Passed to G. V. De Long, Mt. Elgin, Ont., Can.; then to O'Riley & Fitten, Simcoe, Ont., Can.; then to J. A. Colter, Brantford, Ont., Can.

DAVID M. 13465, (6) bl h foaled 1889; by Corinthian 2413; dam Dictora, by Dictator 113, etc. [See Vol. IX.] Passed to W. W. Milam; then to St. Clair & Curry, Lexington, Ky.; then to A. E. Woods, Hume, Ill.

DEW DROP, (7) b m foaled 1889; by Young Wilkes 951; dam Madge, by Hambletonian Prince 819, etc. [See Vol. X.] Passed to A. W. Holthouse, Alleghany, Pa.; then to F. H. Bierbower, Maysville, Ky.

DICTATOR WILKES 5231, (6) br h foaled 1884; by Red Wilkes 1749; dam Nancy Lee (dam of Nancy Hanks, 2:09), by Dictator 113, etc. See Vol. VI.] Passed to H. B. and H. D. Allen, Waterloo, Iowa, February, 1887.

DIRECTRESS, (6) br m foaled 1886; by Director 1989; dam by Abbottsford 707, etc. [See Vol. VII.] Passed to G. Lee Chrisman, Lee's Summit, Mo.

GALILEO REX 12347, (6) br h foaled 1888; by Billy Sayre 5868; dam Dewey Eve, by George Wilkes 519, etc. [See Vol. IX.] Passed to J. Q. Spain, Hartford, Iowa.

GAMALEON 7825, (1, 6) bl h foaled 1887; by Gambetta Wilkes 4639; dam Lady Pepper (dam of Clorine, 2:23¼), by Onward 1411, etc. [See Vol. VII.] Passed to C. E. Pickering, West Liberty, Iowa, February, 1889. Record 2:25¼.

GETA, (6) b m foaled 1890; by California 4132; dam Lady Medium, by Happy Medium 400, etc. [See Vol. X.] Passed to G. C. Astle, Prairie Du Sac, Wis.

GIPSEY GIRL, (6) ch m foaled 1886; by Harlequin 1810; dam Bashaw Bird, by Capt. Pankey 11418, etc. [See Vol. IX.] Passed to C. Thomas, Des Moines, Iowa.

GRACELET, (7) b m foaled 1887; by Mambrino Startle Bonner 4801; dam Nannie T., by Vermont 104, etc. [See Vol. VIII.] Passed to Harry Dumesnil, Louisville, Ky.

GREEN ROSE, (7) b m foaled 1890; by Greenbacks 2480; dam Maggie, by Chief Leo 4533, etc. [See Vol. X.] Passed to D. H. Rankin, Shelby, Mich.

GUYANDOTTE, (7) bl m foaled 1890; by Guy K. 9413; dam Maggie, by Warwick 6423, etc. [See Vol. X.] Passed to C. L. Strode, Chili, Ind., March 16, 1892.

HILGATH 15035, (6) b h foaled 1890; by Jersey Wilkes 2516; dam Hilto, by Harry Clay 45, etc. [See Vol. X.] Passed to G. C. Kenyon, Mount Carroll, Ill.

IDEAL 7171, (6) b h foaled 1885; by Idol 44; dam Emma Jackson, by Stonewall Jackson 292, etc. [See Vol. VII.] Passed to G. C. Kenyon, Mount Carroll, Ill.

JASPER FRANKLIN 8180, (7) ch h foaled 1887; by Ben. Franklin 753; dam Twilight, by Daniel Lambert 102, etc. [See Vol. VII.] Passed to G. H. Fifield & E. L. Andrews, Winona, Minn.

LADY LUMPS, b m foaled 1884; by Lumps 3922; dam Nannie F., by Paymaster, son of Volunteer 55, etc. [See Vol. VIII.] Passed to S. S. Warner, Wellington, Ohio, May, 1891.

LADY PROBERT, b m foaled 1887; by Pompadour 4593; dam Fanny, by Don Roderick, son of Bronx, etc. [See Vol. VII.] Passed to H. Isreal, Damascus, Ohio.

LOA, (6) b m foaled 1890; by Dunblane 2731; dam Macon Girl, by Fugleman 2478, etc. [See Vol. X.] Passed to Cornelius Sullivan, Riverside, Ill.

LOIS, (7) br m foaled 1878; by Mario 1359; dam Mag Worley, by Clark Chief 89, etc. [See Vol. VII.] Passed to F. S. Gorton, Chicago, Ill; then to J. I. Mershon, Mt. Carroll, Ill.

LOTTIE M., (7) ch m foaled 1890; by Pompadour 4593; dam Maud Miller, by Prophet Wilkes 4536, etc. [See Vol. X.] Passed to R. N. McConahey, Alleghany City, Pa.

LULU N., (6) b m foaled 1886; by Ajax 40; dam Fanny N. (dam of *Apple Jack*, 2:18), by Kimo 4513, etc. [See Vol. VIII.] Passed to Henry Billings; then to M. L. Billings; then to Charles B. Fletcher, Indianapolis, Ind.

MAGGIE W., (7) ch m foaled 1887; by Exile 1143; dam Molly L., by Alar Clay 706, etc. [See Vol. IX.] Passed to Peter Hospers, Armour, S. Dak., March 25, 1892.

MAJOR EDSALL JR. 19183, (4) gr h foaled 1868; by Major Edsall 211; dam by Ulster County Whip, son of Blackbird (Perrine's), etc. [See Vol. III.] Passed to Peter Switzer, Coin, Iowa; then to William M. Kemp and H. P. Duffield, Shenandoah, Iowa; then to D. C. Rankin, Tarkio, Mo.; then to W. B. Van Sant, Omaha, Neb.; then to B. W. Hardenbergh, Coin, Iowa. Sire of *Major Wonder*, 2:13½.

MARINET 11795, (6) b h foaled 1889; by Middletown 152; dam Jetwood, by Blackwood Jr. 380, etc. [See Vol. IX.] Passed to C. Slaughter, Madison, N. J.

MAUD FRANKLIN, (7) ch m foaled 1882; by Ben Franklin 753; dam Nell, by Sherman Black Hawk 142, etc. [See Vol. V.] Passed to N. J. Stillman, Troy, N. Y.; then to Arthur E. Greene, Berlin, N. Y.; then to T. A. Mitchell, Weedsport, N. Y.

MEMORIAL, (7) b m foaled 1889; by Mercuriur 9371; dam Fanny R., by Major Edsall 211, etc. [See Vol. IX.] Passed to Jesse Johnson, Parkville, Mich.; then to Charles Koch; then to W. G. Simpson, Mendon, Mich.

MIDDLEBORO 13668, (6) gr h foaled 1890; by Middletown 152; dam Silveretta, by Sultan 1513, etc. [See Vol. IX.] Passed to H. G. Reemsnyder, Ephrata, Pa.

MILA WILSON, (7) b m foaled 1878; by Blue Bull 75; dam Pet Hammond, by Abdallah 15. [See Vol. X.] Passed to Tiffin Brothers, Defiance, Ohio; then to M. E. Loose, Napoleon, Ohio.

Digitized by Google

MONITA, (6) ch m foaled 1890; by Monon 4071; dam Princess Mabel, by Kentucky Prince 2470, etc. [See Vol. X.] Passed to J. I. Mershon, Mt. Carrol, Ill.

MOXIE, (7) b m foaled 1887; by Norwood Chief 1392; dam Juno, by Peacemaker 260. [See Vol. VIII.] Passed to Judson H. Clark, Elmira, N. Y.; then to F. W. Bennett, Syracuse, N. Y., May 12, 1891.

MUSKEGON 6982, (7) br h foaled 1886; by Masterlode, 595; dam Kitty (dam of *Madge Miller*, 2:26½), by Creeper 1664, etc. [See Vol. VII.] Passed to William Sharp, Grand Rapids, Mich.; then to Bettner & Adams, Reed City, Mich., December 29, 1891.

PEARL, (6) b m foaled 1886; by Sherman 1506; dam Lady Star, by American Star 37, etc. [See Vol. VII.] Passed to R. M. Fairfield, Fairfield, Mass.

PERDURO 15942, (4) bl h foaled 1881; by Durango 1115; dam Maggie Wells, by Wadsworth Tuckahoe, son of Tuckahoe (McCulloch's), etc. [See Vol. X.] Passed to Charles J. Off, Peoria, Iowa; then to George Davidson, Mechanicsville, Iowa.

QUEEN VICTORIA, (6) br m foaled 1886; by Captain 805; dam Abbie D., by Doyle Knox 5048, etc. [See Vol. VII.] Passed to Courtney Warren, Buda, Ill.; then to Cornelius Sullivan, Riverside, Ill.

RELIA, (7) b m foaled 1889; by Diver 5400; dam Belle Barrows, by Red Eagle 872, etc. [See Vol. VIII.] Passed to Perry Himmel, Thornville, Ohio; then to W. P. Brobeck, Rich Hill, Mo.

ROSABELLA, br m foaled 1875; by Almont 33; dam by Mambrino Chief (McDonald's), etc. [See Vol. III.] Passed to C. C. Foster, Boston, Mass.; then to F. A. Roberts, Waterville, Me.

ROSE, (7) bl m foaled 1890; by Dunblane 2731; dam Agnes, by Boaz 4742, etc. [See Vol. X.] Passed to Cornelius Sullivan, Riverside, Ill.

ROXILLE 12849, (6) br h foaled 1890; by Reveille 1472; dam Nadeen, by Nugget 1398, etc. [See Vol. IX.] Passed to H. Isreal, Damascus, Ohio.

SABRINO 12249, (6) ch h foaled 1889; by Amaranth 11780; dam Fearless (dam of Keokee, 2:25¼), by Western Fearnaught 941, etc. [See Vol. IX.] Passed to J. D. Mellinger, Gibson City, Ill.

SPRINGSTEEL 10624, (6) b h foaled 1887; by Monte Carlo 2429; dam Engleside, by Harold 413, etc. [See Vol. VIII.] Passed to R. Pilmer and Wesley Spain, Des Moines, Iowa.

TOM LUPTON 6743, (7) b h foaled 1883; by Alcyone 732; dam Henretta, by Darlbay 441, etc. [See Vols. VII and X.] Passed to John M. Dobson, Lynn, Mass.

VERA COSSACK, (6) b m foaled 1887; by Don Cossack 980; dam Kate Carman, by Bashaw 50, etc. [See Vol. VII.] Passed to F. S. Gorton, Chicago, Ill.; then to J. I. Mershon, Mt. Carroll, Ill.

VICTOR ENE 12627, (6) br h foaled 1889; by Roberdean 4958; dam Ariana, by Fairy Gift 1145, etc. [See Vol. IX.] Passed to L. E. Clement, Peirce City, Mo., April 6, 1892.

VINAIGRETTE, (7) b m foaled 1887; by Vigo 3643; dam Lady Geraghty, by Blue Bull 75, etc. [See Vol. VII.] Passed to J. D. Mellinger, Gibson City, Ill.

VIOLA, (6) br m foaled 1889; by Madrid 1835; dam Gleaner, by Onward 1411, etc. [See Vol. IX.] Passed to William Douglas, Joliet, Ill.

VIXEN, (6) gr m foaled 1890; by Abdallah Mambrino 3715; dam Sally Ann, by Mambrino Time 1686, etc. [See Vol. IX.] Passed to C. H. Talbot, Versailles, Ky.; then to A. E. Woods, Hume, Ill., March 17, 1892.

WASATCH 10916, (6) ch h foaled 1887; by Woodnut 5334; dam Flora Peacemaker, by Peacemaker 260, etc. [See Vol. VIII.] Passed to John W. Taylor; then to Stayner Bros., Salt Lake City, Utah; then to R. J. Taylor, Ogden, Utah, April 25, 1892.

WAWA, b h foaled 1890; by Cedarwood 4441; dam Flora Hedges, by Dick West 6949, etc. [See Vol. IX, page 670.] Passed to John T. Ellis & Co., Philadelphia, Pa.

WILLA L., (6) b m foaled 1889; by Wellington 2716; dam Lassie, by Lyle Wilkes 4658, etc. [See Vol. VIII.] Passed to E. O. Fretwell, Paris, Ky.; then to F. H. Bierbower, Maysville, Ky.

WINONA, (7) b m foaled 1886; by Deucalion 889; dam Mary Page, by Lambert Chief 3432, etc. [See Vol. VIII.] Passed to Stephen C. Howard, Providence, R. I.

THE METHODS OF PALO ALTO.

BY S. T. H.

V.

BEFORE concluding the reflections upon the "trotting-pitch" formation of the great performers at Palo Alto, recent criticisms relating to the further use of thoroughbred blood, at that leading breeding establishment, demand thoughtful consideration. Three objections to the thoroughbred infusion are persistently repeated, namely: (a) that the thoroughbred mare has been exhaustively tried in attempts to improve the breed of trotters with either indifferent success or signal failure; (b) that the total showing in support of this method of producing extreme speed is limited to two instances—Palo Alto, 2:08¾ and Fanny Witherspoon, 2:16¼; (c) and that Electioneer alone has shown the trotting potency to engraft trotting speed upon half-bred produce.

These objections demand impartial investigation. In the history of the use of the thoroughbred mare, for trotting-brood purposes, especially in Kentucky, undoubtedly isolated instances are sparsely scattered through the books of being mated with great trotting sires, from the very inception of the enterprise. But it is uncontroversially true that no systematic test, upon a scale sufficiently comprehensive to warrant a definite conclusion, beyond the confines of Palo Alto, has ever been made. The experiments of the late R. A. Alexander, at Woodburn, have been vaguely cited as convincing and abundant proofs of the futility of this method of employing the thoroughbred mare, but the citations from the books of Woodburn, and the official statements of its able superintendent, Mr. L. Brodhead, in former papers, on this subject, by the author, clearly show this statement is entirely erroneous. The extent of breeding a few thoroughbred mares to trotting stallions at the famous Woodburn establishment was to secure broodmares to be bred back to trotting stallions, thus securing two trotting crosses upon a thoroughbred foundation. The half-breds were never designed for great trotting performers, and were never used for such, unless they were geldings, like John Morgan, 2:24, or stallions like Tattler, record 2:26. To repeat the error, therefore, that the experiment of producing great trotting performers out of thoroughbred mares had been thoroughly tried, at any other establishment, before it was fairly and fully inaugurated at Palo Alto is in plain contradiction of historical verity. Even if such had been the experience of the past the modified conditions of the present would not now preclude a more pronounced success as foreshadowed by the brilliant results at Palo Alto. The trotting-bred sire has more prepotency at present, than at any time in his history. He has more trotting crosses, more developed speed, a more perfect action, with less mechanical appliances, all powerfully reinforced by an intensity of trotting inheritance, that would enable him to more easily overcome any opposing traits in the disposition or antagonistic features in the structural formation of the thoroughbred, than ever before in his history. To-day he is more competent to eliminate everything objectionable in the thorougbred, and to retain the great desideratum of the speed of the race mare, modified, by his controlling

Digitized by Google

influence upon the produce by converting its movement to the trotting action, than he was a single generation ago.

While the trotting sire has been thus improved, the thoroughbred dam has been selected with much more discriminate judgment. Palo Alto has been gradually educated to these requirements. The thoroughbred mare, simply because she is pure in lineage, and has the requisite size, soundness and power, is no longer considered eligible, unless she has pronounced trotting action, and a well-balanced brain.

In the line of this thought the active superintendent of the horse department of Palo Alto thus advises the writer:

"There were many thoroughbred "mares bred to trotting sires at Palo "Alto in the past that were not carefully "selected for that purpose. They nei-"ther came from great running families, "nor did they have much trotting action, "nor did they individually have speed at "their own natural gait."

This haphazard, unmethodical method of attempting to breed half-bred trotting performers has passed away to be numbered among the crudities that beset all new enterprises. It has become a settled tenet at Palo Alto that there must be just as much discrimination in the selection of thoroughbred as of trotting-bred mares for trotting-brood purposes. It has been demonstrated that certain thoroughbred strains will produce trotters more certainly than others, and that these, in every instance, are selections from the greatest racing families in which both speed and endurance predominate. This is, now, the well-defined policy of Senator Stanford, which has been recently repeated by that eminently successful trotting-horse breeder, Mr. Munroe Salisbury, in his latest turf interview. But his is not merely opinion. He, too, has, this spring, at his California ranch, quite a crop of young trotting colts, out of thoroughbred mares that are his special pride. He claims they are easier to break, and learn to trot more readily, under the present advanced methods of training, than trotting-bred youngsters, simply because they have inherited a larger measure of intelligence.

The alleged failure of half-bred trotters has been attributed to their readiness, when heated in a close contest, to resume the gallop, the gait of their older inheritance. But the experience at Palo Alto is to the contrary. The potential fact that they are never permitted to run, but that, from their first lessons in the kindergarten to their finishing tuition in public races, the imperative necessity of adhering to the trot is so incessantly enforced upon them that the desire to assume any other gait than the trot, which alone they have known and cultivated from their earliest colthood, is well-nigh eradicated. The proof of this controlling effect of persistent training early and late, is furnished in the turf careers of Palo Alto, Azmoor, Whips, Gertrude Russell, Aldeana, Emaline and Ansel; for, in their respective classes, no more reliable turf winners can be named.

But possibly a more practical demonstration of their reliable trotting action is found in the simplicity of their equipment. One of the cardinal principles, at Palo Alto is to shoe all the trotters as lightly as possible. The half-bred trotters are shod precisely as are the pure bred ones. The general rule is the concave-seated shoe, weighing ten ounces in front, and six ounces behind, with only such protecting boots as experience has taught all skillful trainers are necessary as preventive precautions against unforseen accidents. This alone is ample verification of what the able superintendent adds: "As to temperament, take an "even number of trotting-bred and half-"bred colts, and, by actual test, the half-"bred are as well balanced, as to gait "and disposition as the trotting-bred."

This testimony is simply invaluable. It is not the *ipse dixit* of a turf editor, in his sanctum, or of a Register compiler in his office, but the daily experience of a practical master in the only training school in existence, where half-bred and pure-bred trotters are broken and developed upon precisely the same course of tuition. The entire science of producing trotting speed is based upon empiricism; and these practical demonstrations in the course of time are certain to exert their proper influence upon the advanced trotting horse breeders. The correlative

Digitized by Google

proposition of trotting purists, is that thoroughbred mares of all classes, whether from high racing families or not, have failed to produce extreme speed, the only exceptions being those of Palo Alto, 2:08¾, and Fanny Witherspoon, 2:16¼. The palpable unfairness of this statement is exemplified by tabulating from the catalogues of all the great trotting-farms, the number of thoroughbred broodmares used in contradistinction to those highly trotting bred. The vast majority of them have not a single thoroughbred broodmare in the list, though the trotting-bred ones aggregate into the hundreds. The home of Red Wilkes and of Dictator and of Wilton and of Baron Wilkes and the harem of Onward and the paddocks of Lord Russell, and so on generally throughout the list, have not a single thoroughbred mare. The Village Farm of C. J. Hamlin has the temerity to catalogue five out of a list reaching to one hundred and twenty broodmares; and Village Farm is the leader of the eastern radicals in breeding the trotting horse. These facts, taken in connection with the historical certainty that no methodical attempt has ever been made to produce trotters out of thoroughbred mares, beyond the precincts of Palo Alto, stamps the deduction that great trotting performers, saving the two noted exceptions, have never come from this cross with the philosophic meagerness it deserves. Palo Alto furnishes the only broad, sufficient test. Even there the experiment is only in its infancy.

It should not be criticised with that exhaustive logic that only is warranted by a completed experiment. The tables elaborated in former papers, from the records of Palo Alto, prove that the extremest speed has come there from the half-bred dams, and the next classification of trotting speed has come from the thoroughbred dams; while the pure trotting-bred mares occupy the third position as matrons of great speed. In thirteen years Palo Alto has produced fifteen trotters out of thoroughbred dams. Among them is not only the champion trotting stallion, but three others with records in 2:21 or better. When the statement was made that only Palo Alto and Fanny Witherspoon, out of thoroughbred mares, had records better than 2:20 the extent of such special pleading is exemplified, when, it is remembered, that Express at seven years old made a record of 2:21, and Azmoor at the same age, 2:20½, and Ansel at the same age of 2:20. It is a well-known fact that all of these, with Big Jim in addition, had made much faster trials, but these records were made in actual contests, before official public trials had become popular as standard. But the climax of special pleading is found in the often repeated platitude that Electioneer alone had trotting potency in sufficient excess to engraft trotting speed upon his half-bred produce. The typical gait of Electioneer and his get is line trotting. His half-bred produce is no exception. Like those out of pure trotting-bred mares, they are rapid in action, with rather bold knee articulation and slight hock elevation, moving with resolute precision, close to the ground. They require no weight to balance their action, and can trot remarkably fast without shoes. They are wonderful trotters, coming early and lasting longer than those out of trotting-bred mares. But while the Electioneers have overshadowed the half-bred trotters by other Palo Alto stallions, it is not true that the other sires there, have not produced promising half-bred performers. For instance: Gen. Benton produced Waxana, the famous dam of Sunol, out of Waxy, by Lexington. Waxana was an exceedingly promising trotter. In 1880, when two years old, she trotted quarters in forty seconds, which was very fast for a Gen. Benton youngster; but that year came out the great two-year-old Fred Crocker, by Electioneer, out of Melinche, by St. Clair, who made the champion record of 2:25¼, and Waxana, as not quite so well advanced, was left at home. The next year as a three-year-old, she was bred, and has been used as a broodmare ever since, being the dam of six foals, Gen. Wellington, 2:30, and Sunol, 2:08¼ being among the number. Again, Gen. Benton sired Benton Frolic, out of Frolic by Thunder, first dam Imp. Liskin by Muscovite. Benton Frolic was an exceedingly promising trotting colt. In his three-year-old form he trotted quar-

Digitized by Google

ters in thirty-seven seconds and was driven a half mile in 1:14, but the marvelous speed of Hinda Rose, by Electioneer, out of Beautiful Bells, who made a record of 2:19½ in the same class, so decidedly outranked the colt performances of Benton Frolic that he was retired as the standard bearer of Palo Alto, in favor of Hinda Rose.

Gen. Benton also produced Tom Benton from Mollie Shelton, by Rifleman, out of Eva Bascom by Lodi, son of imported Yorkshire. Tom Benton gave brilliant promise in his two-year-old form. The record of Palo Alto shows that he trotted quarters in forty seconds, but his speed enticed a wealthy roadite to consign him to private use, and he was gelded and forever lost to the turf. Gen. Benton afterward produced Telie, out of Texana, by Foreigner, dam Mary Woods, by Imp. Yorkshire. In the early season she was regarded as the two-year-old standard bearer of the farm. She learned to trot in two minutes and forty seconds by midsummer; but the grand old thoroughbred mare, Dame Winnie, contributed, that year, Palo Alto to contend for the class honors of the season. He showed a public trial in 2:23¾, and the next year (1885) Telie as a practically undeveloped but very promising three-year-old filly, found her way into the general broodmare list. From this she has been transferred, by reason of her standard performing produce, into the table of great broodmares; for she is the dam of Truman, three-year-old record 2:22, and of Tiny, two-year-old record of 2:28¼. The year before Electioneer had begotten Palo Alto, out of Dame Winnie (1882), Gen. Benton had contributed to the turf, from the same mare, Big Jim, whose race record of 2:23½ in his eight-year-old form had been beaten four seconds in private trials, driven by Trainer Nolan, before the genius of Marvin developed the extreme fractions of speed in the Palo Alto trotters. These five, with the exception of Belle Campbell, out of Miss Campbell, by Endorser, who, because of a serious injury was never worked, and a bay colt out of Fannie Lewis, that grew to be seventeen hands high and became early too growthy to handle for speed, comprise all of the foals of Gen. Benton out of strictly thoroughbred mares at Palo Alto. The completed record thus stands. Gen. Benton produced seventeen standard trotters, sixteen out of trotting-bred or untraced mares, and one out of a thoroughbred mare. The proportion of standard produce out of thoroughbred mares is one out of seven, a much greater average than his standard produce out of trotting-bred mares. Four out of these six Benton half breds were promising trotting colt performers. Had they been trained on, instead of being retired, the majority of them, like Big Jim, would undoubtedly have trotted their way into the standard list of performers.

In point of time Nephew outranks the other stallions at Palo Alto, having been transferred from Kentucky to California in 1877, while Piedmont was located there in 1882. Neither one of them have thus far proven themselves to be potent trotting sires. Nephew is eighteen years old, while Piedmont is twenty-two. Each one has sired eight standard performers—one, Geneve, by Nephew, being out of a daughter of thoroughbred Jack Hawkins. The oldest of Nephew's produce out of thoroughbred mares, at Palo Alto, are five years old this spring, and none of them have been handled prior to March, 1892. Indeed, all of the half-bred Nephews have been raised at Vina, a branch of the Palo Alto establishment, located in the northern part of California. They comprise, all told, only eleven living foals. They were simply broken, single and double, then gelded, and turned out at Vina. The Piedmonts were subjected to the same treatment. It had been sufficiently demonstrated, in the training stables, that the Piedmonts, without regard to the breeding of their dams, do not develop early speed, which is now the destructive passion of both breeders and trainers alike, with rare exceptions, like Mr. Backman among the breeders and Mr. Budd Doble among the trainers. Palo Alto, striving for the ascendancy among the great trotting stock farms, recognized the fact that the only method of attaining the leadership was through her standard performers, and she therefore pushed her colts and fillies, gifted with precocious speed, into the standard list as rapidly as the kinder-

Digitized by Google

garten and the training stables could develop them. The slowly maturing Piedmonts, no matter how their dams were bred, were not phenomenal colt trotters, and they were as rapidly consigned to Vina—the fillies as broodmares, and the colts for subsequent development at maturity. The enormous increase of foals each year from 350 broodmares, rendered it impossible to develop them all in the training stables at Palo Alto, and they were indefinitely rusticated at Vina. But the world-wide attention that has been attracted to the methods of Palo Alto, as well as the magnitude of its monetary interests, and the demands for its representatives of developed speed, have made training a necessity at Vina, as well as at Palo Alto. It has been established there, since the beginning of this season, on precisely the same principles of development that have made Palo Alto such a marvelous success. Thus early in its career Vina presages the triumphs which the parent establishment enjoys. Reports from the many neglected two, three, four and five-year-olds give earnest of great trotting performers, in the immediate future, and among the most promising, are rated the Nephew and Piedmont half-bred produce. If these justify their promise, then the last objection of trotting purists to thoroughbred broodmares will be completely annihilated. All that the radical proprietor of Palo Alto seems to request for the rich fruition of his methods is a reasonable time for practical demonstration.

There was no other rampart of defense for trotting purists than the special plea that Electioneer alone had trotting potency and prepotency enough, among all the myriads of richly bred trotting stallions, to produce great trotting performers out of thoroughbred broodmares. This assumption is not based upon empiricism; for it is not claimed that the richly inbred, powerfully prepotent trotting sires of the present day have been given an opportunity, with judiciously selected thoroughbred broodmares of pronounced trotting action, and the lineage of stout and winning racing families. But the conclusion is based upon some supposed unmade experiments in the past, as broad and intelligent as those in process of development at Palo Alto, which, historically speaking, is a delusive assumption.

To the disinterested student of the breeding problem, this position of trotting purists is a pitiable begging of the whole question at issue. It virtually concedes that in Electioneer culminated trotting potency. The breeding of trotters is being forced with startlingly increased scientific momentum every year. Its progress has become tremendous. Brains and treasure without limit are concentrated in manifold accumulations, in this enterprise every season wonderful improvements in the harem, in the paddocks, in the kindergartens, upon the race courses have been as rapid as they have been without the back-set of even natural reactions. Blood has been made richer by inbreeding and outcrossing; form has been made more perfect by the selection of the best structural specimens for mating; and speed has been increased beyond the flight of enthusiastic fancy, till yearlings can now beat the record of the old Gray Queen of the Turf, Lady Suffolk, and two-year-olds can dazzle, with a total eclipse, the records of all the kings and queens of the trotting turf from the reign of Dexter to the beginning of the trotting dynasty.

Yet we are asked to subscribe while we are still in the irresistible flow of this mighty gulf stream of progress, thus sweeping on with ever increasing momentum, that trotting potency has actually culminated, so far as concerns thoroughbred mares, in the dead Electioneer! We are commanded to receive, as an established truism, without the benefit of adequate experiment, or trial, that he, and he alone, had the mighty trotting prepotency to beget trotting progeny out of thoroughbred mares; and that this transcendant gift, amounting in natural history to a freak of nature, and nothing more, died forever with him. The sire of Electioneer was the undeveloped produce of a horse that was never subjected to harness, out of a roadster mare that received and finished her trotting education in a butcher's cart. His dam was an undeveloped daughter of Harry Clay,

Digitized by Google

who, like Rysdyk's Hambletonian, drew largely upon his dam, the daughter of the imported Norfolk trotter, the undeveloped Bellfounder, for her trotting inheritance. Electioneer, too, was undeveloped, though he had abundance of natural trotting speed, as evidenced by the testimony of Charles Marvin, who informs the author that he turned him a quarter in thirty-four seconds to a spring sulky weighing 125 pounds. Moreover, Electioneer came from the womb of a Clay mare, and Clay blood has been epigrammatically condemned by a distinguished trotting-horse breeder as "like sawdust in oats, the less of it the better." Yet it is, nevertheless, the best trotting blood outcross with Hambletonian for producing standard trotters of quantity and quality, as shown by the unequaled success of Electioneer and George Wilkes. Another distinguished authority concedes to Electioneer speed of the highest grade, but condemns him for his faulty front action, and want of endurance, because he lacked carrying capacity in the muscles of the forearm. But his breeder, the courteous Mr. Charles Backman, affirms that this exception is not well taken. In a letter to the author dated May 17, 1892, he says: "From time to time "there have been many misrepresentations "in regard to Electioneer. The most of "the articles I have seen were undoubt-"edly written by persons who knew "nothing about the horse. I considered "him as perfect a horse in formation as "I ever bred. I would consider his pro-"pelling power equal to that of any "horse of his size that I have ever seen. "His gait was as near perfect as any "horse I ever bred."

Nor does this imputation of defective formation seem to rest justly upon his produce, for Mr. J. C. Sibley, who owns more of his get than any other breeder, thus informs the writer:

"Sunol, owned by Mr. Bonner, but "now at our place, measures twenty-one "and a half inches at the forearm; Cecil-"lian, three years old, twenty-two inches; "Ah There, four years old, twenty-two "and a half inches; Silk Floss, two years "old, twenty-two inches; Outcross, four "years old, twenty-two and a half inches; "Veda, five years old, twenty-three and "a quarter inches; Idelia, four years old, "twenty-three and a half inches; and "Bel Sire, a yearling, nineteen and three-"eighths inches." Sunol, the trotting queen, has the least forearm measurement of any of these, and no authority would have the temerity to suggest that she lacks carrying capacity forward.

Concluding, then, from these reliable facts that Electioneer was a model sire in blood elements, form, action, speed and potency, trotting purists place themselves on either one of the horns of an unpleasant dilemma. If Electioneer alone possessed the superlative of trotting prepotency, which enabled him to control the action and disposition of half-bred produce, then, it follows, that the Electioneer colts should be more richly endowed as trotting sires than the sons of any and all other trotting stock horses, and should be cultivated to the disuse of all other strains. The very enunciation of this proposition meets with its denial in the stud careers of many sires of different breeding from that of Electioneer. Again if Electioneer was supreme as a trotting sire, it follows that some of his sons, having greater speed, richer lineage, more power and developed inheritance, should not only equal, but exceed him, as a many-sided trotting sire. Already some of his half-bred sons like Ansel, and Anteo and Antevolo are proving their superior trotting inheritance as sires.

There has been retained for service at Senator Stanford's establishment: Palo Alto, 2:08¾; Advertiser, 2:16; Electricity, 2:17¾; Azmoor, 2:20½; and Langton, 2:26½; all sons of Electioneer but the last. He is by Alfred, who is the son of General Benton, out of Alice, by Almont 33; second dam Norma, 2:33½ (dam of Norval, 2:17½), by Alexanders Norman, sire of Lula, 2:15. The dam of Langton is Laura C., 2:29¼, by Electioneer; second dam Fanny Lewis, by Imp. Buckden. Two of the other four stallions have thoroughbred dams, and two have a trotting lineage, on both sides, that can not be excelled in trotting history. These have been absolutely reserved for stock purposes. Shining gold has not weight or glitter, or equivalent enough to tempt their owner into parting

Digitized by Google

with them. Brilliant and promising as have been the many entire trotting horses sold from Palo Alto, it is the judgment of its owner that the five thereon reserved are equal to, if not better, than any he has ever sold. Palo Alto is heavily engaged in the harem. Nothing superior could be granted to him in the condition and quality of broodmares brought to his embrace. He not only has the champion record, but his dam is prominent in the table of great broodmares, while he has the Electioneer "trotting pitch" formation, and the family peculiarity of action, trotting in straight lines with rapid stroke, close to the ground, with a fine roll of the knee, and noticeably very little hock action.

Azmoor is equally rich in thoroughbred lineage that has mingled powerfully with trotting blood. His dam is meritoriously enrolled in the table of great trotting broodmares, being not only the dam of Azmoor, 2:20½, and of Don Monteith, 2:29¾, but also the dam of Eliza Dolph, that produced Aldeana, record 2:25 at nine years of age. Azmoor, like Palo Alto, but unlike many of the Electioneers out of thoroughbred mares, came to his speed in early colthood. In his four-year-old form he scored a record of 2:30¼, which he reduced when six years old to 2:24¾, and when seven years old to 2:20½!

Already he is showing his capacity of reproducing trotting speed from thoroughbred mares with greater intensity than his sire. His daughter, Rowena, out of Emma Robson, the thoroughbred dam of Emaline, record 2:27½ as a five-year-old, trotted to a record of 2:37 as a yearling, and, had she not met with an untoward accident, she would have shown that the superlative trotting potency of Electioneer to control the disposition and action of thoroughbred mares did not become extinct with him, but has been transmitted in accordance with the law of inheritance by him in an intensified form to some of his sons, even though they are themselves out of thoroughbred mares. Rowena is now in fine form and improving her speed with remarkable ease and rapidity. But her yearling performance is greater than the record of any yearling son or daughter of Electioneer out of a thoroughbred mare. It certainly indicates that the theory of trotting purists that Electioneer was the acme of trotting potency when crossed with thoroughbred mares, will be shown to be a mere theoretical chimera before the records of this season are gathered into the next Year Book.

But, the half-bred sires apart, in Advertiser and Electricity, Senator Stanford has succeeded in augmenting the trotting potency of their sire, unless the law of transmitted inheritance is a delusive speculation. Electricity is a brown horse, standing sixteen and a half hands high, and ranges grandly in proportion. His sire was Electioneer, the paragon of trotting sires, and his dam was Midnight (the dam of Jay-Eye-See, 2:10, and Noontide, 2:20¼), by Pilot Jr., out of Twilight, by Lexington. In him is combined the elements of producing extreme early speed derived from both sire and dam. His own record of 2:17¾ at seven years of age was reduced from 2:22 in one trial, and there is a reserve of speed that future trials will readily demonstrate. On the side of his dam is concentrated the identical blood lines that have made Maud S. and Nutwood, and their correlative representatives, colossal figures in American trotting annals. If there can possibly be any combination superior to Electricity, it can only be found in the peerless Advertiser, whose owner refused to accept for him the princely price that induced him to part with the still more princely equine, the wonderful Arion. Advertiser is likewise a brown colt, full fifteen and three-quarters hands high, the embodiment of power and symmetry and speed formation.

Not only the laws of heredity, but preëminently the capacity of the potent Hambletonian and of his lineal descendants, in transmitting trotting inheritance, bespeak for Advertiser the mantle of succession, at Palo Alto, that fell from his great sire when he sank to earth full of equine honors.

In him Palo Alto has all the valuable qualities that can be combined in the most perfect trotting stallion of the present day. He has the requisite size, color, formation, power, blood elements, action and speed, to fill this exceedingly difficult

Digitized by Google

place in this era of wonderfully successful trotting sires, in both lineage, performance and progeny. His sire is Electioneer—the sire, *par excellence* of trotting animals—the sire of Sunol, the reigning queen, and of 100 standard trotters, being thirty-two more than any other trotting sire, living or dead, has ever begotten. In the wide range of trotting pedigrees, nothing up to the day of his birth was richer in trotting inheritance than the lineage of Electioneer. His sire is Hambletonian, the inbred Messenger, with the very choicest of all trotting outcrosses, the Bellfounder, whose sire and dam were the best Messenger trotters of their day. The sire of forty standard trotters, more than any other horse ever before his time produced one of them, Dexter, being the champion trotting performer of the turf in his day; the sire of 129 sons, who have begotten 955 standard trotters by performance, and forty-eight pacers, far more than the sons of any other great trotting sire has produced; and these sons have been in succession the champion sires of their periods; the sire of fifty-nine daughters, that have become the dams of seventy-three standard trotters, and one pacer; among the number being the dam of Greenlander, 2:15¼, Trinket, 2:14, and Stamboul, 2:11—far more producing dams than any other trotting horse ever sired.

The dam of Advertiser's sire was Green Mountain Maid, the dam of eight standard performers, two with records of 2:20, one with a record of 2:20¾ and another with a record of 2:22. She is the daughter of Harry Clay, 45, record 2:29. His sire was Cassius M. Clay Jr. 20, the sire of four in the list, and of Clay Pilot, from whom came the superb Sultan; and his dam was Fan, by imported Bellfounder, the trotter, whose daughter gave birth to Rysdyk's Hambletonian, the only surviving son of Treadwell's Abdallah, who has perpetuated the Messenger preeminence. Moreover, Harry Clay, the sire of Electioneer's dam, was also the sire of fifteen dams of twenty-six trotters, among the number being such representatives of extreme speed as Bodine, 2:19¼, and St. Julien, 2:11¼. Advertiser's dam is Lula Wilkes, by George Wilkes, the sire of sixty-eight standard trotters by performance and seven pacers; the sire of seventy-four sons, who have produced 406 standard trotters, by performance; and eighty-two pacers, many of them representatives of extreme speed; and the sire of thirty-four dams that have produced thirty-eight trotters and four pacers, among the number being Manager, three-year-old record 2:11½, and Delmarch, record 2:11½. No more honor can be bestowed upon the sire of Advertiser's dam than to state, that by the record he stands only second to Advertiser's sire.

Thus, Advertiser is an inbred Hambletonian, an inbred Clay of the highest excellence, and the Norman outcross is worthy of the combination. His grandam was Lula, record 2:15, by Alexander's Norman, the sire of extreme speed, and of sons the sires of extreme speed, and of twelve daughters the dams of sixteen trotters, among the number being the dams of Fanny Robinson, 2:20¼, and Norman Medium, 2:20, and Norval, 2:17½. The only thoroughbred blood appears in his great-grandam Kate Crockett, by Imp. Horton, out of Mary Blaine, by Texas, but she blended so kindly with the less prepotent trotting sires of her day as to produce Lula, who threatened to wrest the crown from Goldsmith Maid. To complete the splendid pageantry of Advertiser's heraldry by his own performances, he began his three-year-old history with a record of 2:22½, and ended it with a record of 2:16. Only two of the wonderful three-year-olds, Sunol and Axtell, have exceeded this performance.

No more splendid example of trotting heredity can be found in trotting annals. Superadded to blood and performance, he has the "trotting pitch," standing, like Sunol and Maud S., higher over the couplings than at the withers. Moreover, in structural formation, constitutional stamina, well-made, powerful limbs and feet, and steady, reliable trotting persistency, he is without a superior. He is rich in color, and a model in proportions, with the Hambletonian markings of white hind feet and ankles.

With this superb colt, combining all the superlative essentials of success in the trotting stock horse, Senator Stan-

Digitized by Google

ford proposes to prosecute the experiment of the thoroughbred outcross on the side of the dam, for, before Advertiser has reached the period of horsehood he is stinting him to thoroughbred mares. Last year, in his two-year-old form, he was bred to Dame Winnie, the thoroughbred daughter of Planet, out of Liz Mardis, by Imp. Glencoe, grandam Fanny G. (by Imp. Margrave, sire of the dam of Edward Everett), the grandam of Alma Mater, the dam of five standard performers, one of them being Alcyone, who has begotten twenty-four, and another, Alcantara, thirty-eight standard performers. Moreover, Dame Winnie is the dam of Big Jim, 2:23¼, Gertrude Russell, 2:23½, and Palo Alto, 2:08¾.

See how fearfully fast and furious Governor Stanford is thus heaping the great fire of annihilation under the tinder theories of trotting purists!

The orthodox method of Mr. Wallace has produced great trotters, but the heterodox methods of Senator Stanford have begotten still greater ones.

What will be the result of this combination? Can there be found any theorist or breeder that can become so despondent a prophet of evil as to predict failure? If there be one, above him will rise a score of more hopeful seers who will confidently foretell the outcome of this combination in the production of the two-minute trotter.

Sources of Knowledge.—History is always an excellent resort for broadening or enlightening one's views. History is, simply, a record of doings and happenings of successive times, considered from the human standpoint. A history of any animal, is, however, complete or incomplete, just as it has been more or less thoroughly seen or understood by the chroniclers among whom it lived or by whom it was written about. History—human or animal—will always be less or more incomplete. No chronicler can ever know what points are to have most interest for posterity. Whole pages of history may remain unread for periods before the facts or contents acquire a "present" interest. Hence, so long as interest is not alive, chroniclers will continue to overlook such pages. We did not anticipate dropping so early into such a particular interpretation of history, but what we have written may indicate the difficulties in the way while tracing the lineage of deeds or developments. Chronicles are of many other kinds besides written. The wider the use that can be made of these the better interpretation can be made by "investigation." Further one must never confine himself to the facts of the certain and sole individual under examination. A more correct view, suggestive or confirmatory even of truths before obscure, will thus be gained. The comparative method is the surest, most helpful, to pursue; not only comparing with all the individuals of a "family," but all the families of the race, all the "races" of the species, and even with other species of other kinds. For the highest and lowest are but, unconsciously, the "links" of the behind and the before, with ever potential tendency to offer new directions or connections for forms more simple or complex, but apparently gradually, or suddenly adaptable to ever-changing circumstances, or new uses for old conditions.

This may all be somewhat "above" the subject in hand. But we would not regard the effect of one incident in the whole result of time, but the effect of the whole result of time, if that were possible, in that one incident.

The Oldest Natural Gait.—"English horses are of much greater antiquity than English history." The horse was indigenous to the country. Though "small," that was not any evidence of the inferiority of the race. That was simply an evidence of its antiquity and genuineness. All original horses were small, as history proves. The horses represented by the sculptures and monuments of old were evidently not any larger than the original British horse. With domesticating do-

Digitized by Google

minion, the gradual opening up of the country, and progress in the arts of peace, and war, the horse increased in size and substance.

As it is into the blood and breed of the British that our own horses run and trace, it necessarily follows that the former has always an interest for students of the latter.

The great revival of interest in horse-breeding in England of late years, especially in the way of rescuing from oblivion the older breeds, such as the Yorkshire, Cleveland, and Hackney, has stimulated enquiry all along the line. The effect of this has been to exactly define historically the relations between these breeds and the thoroughbred, which, but for the revival mentioned, would have soon obliterated all traces of the other older races. This research has also pointed out the exact historical relations of those breeds which at different times were famed for speed.

This brings us near to the point we were "driving" at. The chief "speeds" known in English horse history are the gallop, the trot and the amble, each of considerable variety, according to the rate of gait. The first belonged to the courser, runner, racer or thoroughbred; the two latter specially to the road or ride-horse, harness or drive-horse, and hackney. In the earlier descriptions of speed races these two classes were called either flat-racers or trotters, as their inclination had developed. This was before the introduction of oriental blood.

Dealing now with this pre-oriental period, the remarkable fact appears that of these two fast gaits trotting was the oldest, and even apparently "the only" speed. This was natural in mediæval times when the horse required to be of such a character as to carry, besides the rider, the heavy armor protecting both. But even before the armored age "trottynge" was in its might. In fact, down to the advent of the oriental, "trottynge" seems to have been the only term used to describe the highest class of horse.

This is, therefore, a valuable fact. It shows that in the development of the (race) species, as in the individual (during colthood), the trot is the first natural idea of speed in the equine brain. Regarding this matter from a wider standpoint, it proves the trot to be the speed of fearless freedom, sturdy staunchness, independent intellect, reserved resource. In fact the trotter exhibits the highest interpretation of the courage requiring brain faculty to distinguish.

Some Tracers.—It is not here asserted that runners or coursers were unknown during all this time. That would be, of course, incorrect. There is evidence in sufficiency to prove indeed that runners were possessed of the land. But they were not so indigenous to the soil.

Hugh the Great, of France, in the year 930, A. D., presented to Athelstan, whose sister, Edelswitha, he had married, several *running* horses, the *equos cursores* of the chronicler. Next, the English breed seems to have been indebted to the Normans, who introduced some excellent stock, partaking much of the same character.

In Sir Bevis of Southampton's, old metrical romance we are shown the beginnings of the turf (*circa* 1320):

In somer, at Whitsontyde,
When knightes most on horseback ryde
A cours. Let they make a daye
Steedes and palfrey for to assaye;
Three myles the cours was then
Who that might ryde him should
Have forty pounds of redy golde.

The racing that took place at Smithfield in Henry II.'s time, described by Fitz Stephen, though generally understood to have been partaken of by running horses, was also participated in, as has been pointed out, by horses that came under the trotting denomination.

"Every Friday," says Fitz Stephen, "except some festival supervene, there is a fine sight of horses brought to be sold. Many come out of the city to buy or look on, to wit: earls, barons, knights and citizens. It is a pleasant thing to behold the horses there, all gay and sleek, moving up and down, some on the amble and some on the trot. Here are also colts yet ignorant of the bridle which prance and bound and give early signs of spirit and courage. Here, also, are managed or war horses of elegant shape, full of fire, and giving every proof of a generous and noble spirit. Horses, also, for the cart, dray and plow are to be found here, and mares big with

Digitized by Google

foal, and others with their colts running wantonly by their sides." His famous description of the racing is also remarkably graphic. This monk's ability in such description is indeed rare. His reports read as if written but yesterday. What a turf writer he would have made to-day. Indeed, he ought to have lived seven centuries later. Such writings as his are perfect mines for the student.

In Henry VIII.'s time, as historians have repeated, "Archbishops and every duke were enjoined to keep seven trotting stone-horses of fourteen hands in hight for the saddle. Clergymen, also, who possessed a benefice of £100 per annum, or laymen whose wives wore French hoods or a bonnet of velvet were ordered to keep one trotting stone-horse under a penalty of £20."

Hollinshed, the chronicler, remarked that "the nag or hackeneie is verie good for travelling." He thus helps to establish the identity of the trotter with the hackney.

Thomas Blundeville, of Newton Flatman, Norfolk, who is supposed to have written in the reign of Queen Elizabeth, in Chapter III, of his principal work, where he is speaking of breeding, and the use to be made of the progeny, says: "Some man, perchance, would have a brede of great trottynge horses mete for the war, and to serve in the field. * * * Some again would have, perhaps, a race of swift runners to runne for wagers." It is apparently from such beginnings that "the turf" gradually accomplished its remarkable departure from the old trotting standard.

Shakespeare would seem to have alluded to racing where he makes Imogen say in *Cymbeline:*

"I have heard of riding wagers where horses have been nimbler than the sands that run i' the clock's behalf."

In 1602 Mr. Oliver Cromwell had all the glory of the day April 6, at Sapley near Huntington, by his horse bearing the "sylver bell." That bauble he doubtless prized. This celebrated roundhead owned some of the finest racing blood of the time.

Trotting was the action and speed of the armor-weighted horse. Running was the speed of the feather-weighted horse. The one the development of the tiltyard, the other of the succeeding gunpowder that rendered armor useless. There is a great deal in these statements, as may subsequently appear.

The Gaits before and after Improvement by the Oriental.—Polydore Virgil remarked that the English did not affect the trot, but excelled in the softer pace of the amble. "For the credit of modern common sense, the English of the present day," remonstrates Lawrence, 1809, "beyond all other nations are attached to the trot, and have lost even the remembrance of the amble, for which they have wisely substituted that natural and pleasant pace, the canter." "Trottynge" had certainly been developed almost exclusively by the mail-covered horse; ambling was, previous to the development of armor, the common pace of the unweighted. But Lawrence does not assert, like Youatt thirty years later, that such a gait as the pace "did not exist" in the horse of his day. "There is plenty of evidence to prove that the American pace of to-day is the same as the amble of Europeans of last century and earlier. The amble (pace) is natural to some horses, which take to it instead of the trot." Stillman says it is impossible to distinguish the pace from the trot in the silhouettes reproduced from the negatives obtained by instantaneous photography. The camera—like "the authors" in Butler's (1612-80, A. D.) Hudibras "having not determined whether pace or trot."

The amble, rack, fox-trot, pace are all different names and degrees of one gait. Distinctions have been drawn and definitions given to them, but they all come broadly under one rule. The amble has been lately described as "a rapid walk," but Lawrence describes it as one would do the rack or pace. The gradations between the gaits are imperceptible. It is only the pronounced gaits that are evident.

Among the young nobility of imperial Rome it was a fad to own, for the sake of the notoriety so obtained, among other kinds "Thieldones (derived from Spain), which were amblers, and Gollonarii and Collatorii trained to step in cadence with their feet high, or perhaps merely

Digitized by Google

trotting; all arts of education and not qualities of races." However much the Roman 400 may have believed that their own training had developed such golden gaits, the fact remains that each class of horse was imported specially from different countries for the special purposes mentioned. At the same time as the above were imported, Manii were also brought from Britain for special purposes in the circus, proving a high degree of intelligence in the original British horse.

During the Roman period the original breeds of Britain seem to have been amblers. In Scotland and Ireland were the galloways and hobbies, described likewise as amblers. There is no confusion in these, it will be seen, descriptions of the oldest writers. But there is much confusion between succeeding and recent writers as to the reality of pacing. There is, *en passant*, a curious disagreement as to its degree of "pleasantness" to rider. Some call it gentle, others call it rough. Nevertheless it seems to have been really the starting point of faster gaits.

Youatt was not well posted on pacing, for he says, in speaking of the Elgin Marbles from the Parthenon, "the horses which are represented thereon as trotting have both their legs on the same side of the body raised at once, the other two being firm on the ground, a position which horses of the present day never assume while trotting." Of the four horses represented in the church of St. Marc at Venice, having the same peculiarity, he remarks that "it is certain that it is never seen to occur in nature in the present day, and indeed it appears quite inconsistent with the necessary balancing of the body, and was therefore more probably an error of the artist." Besides the pacers known to Greece and Rome, there had been in Persia, from time immemorial, a race of horses called *chuppers*, whose gait was ambling, that could do the 700 miles between Teheran and Bushire in ten days. And it is not exactly the fact, though this does not bear on Youatt's assertion, that all the Grecian sculptures represent the pace or amble alone. Copies of some we have seen represent the trotting position of the limbs.

The Pace as "Existing in Nature."—Youatt must have been wofully ignorant of "nature" to make such a statement that such a gait as the pace did not exist even in nature. Elephants, camels, giraffes, rhinoceroses and other animals are pacers naturally. "The elephant," says a most respectable authority, "appears, in walking, to move the two legs on the same side at the same time, and it has occasionally been thought that the order in which the legs are raised from the ground is different from that in the horse. But upon close watching it will be seen that this order is in all cases the same, the only difference consisting in the length of the interval between taking the feet successively up. In the elephant the interval between raising each hind foot and the fore immediately in advance is very short, and it becomes relatively shorter as the pace increases. When the animal walks very slowly the legs appear to move just as in the horse, the interval in the two cases being the same." It is not best to confine our attention to one animal altogether. We sometimes gain enlightenment by the comparative study of other animals. But we refrain from here further following up this "lead." It, however, indicates that the pace, as seen in the horse, is an actual inheritance of its natural lineage. So what can its detractors do about it?

Some have lately taken advantage of Youatt's remarks on the "elimination" of the pacing gait from English horses (*Clark's Horse Review*, March 1, "The Two Gaits"), in writing down the pacer in America. But it will not "down." Its alleged disappearance in Britain, based on such statements as Youatt's can be no argument for its elimination in America.

Historically considered its disappearance in England would indicate an argument in its favor. For, as it will be shortly attempted to be shown, the system of breeding (away from the trotting gaits to the running. by the continual infiltration of racing blood) had assuredly a tendency to the temporary breaking up —obliteration—of old "form" and qualities, while the system of breeding in America (much more constructive) had certainly the tendency to induce a return

Digitized by Google

or reversion of the old predispositions in gaits; so that the more trotting bred the greater, apparently, has been the predisposition to produce that alternative gait that writers call interchangeable, and that the instantaneous camera has pronounced indistinguishable from the trot. The pace and trot may be described as twin gaits both possessed in the individual, one of which may be latent and the other prominent, or both well developed.

That such breaking up, almost altogether, of the thoroughgoing trotter by the thoroughbred racer is a fair deduction seems to have been "taken tent of" by the faithful Lawrence in the beginning of the century, for he says: "It is a remarkable fact that there has existed no instance of a thoroughbred horse being a capital trotter, although some racers have had a quick and short trot; for example Shark, Hammer by Herod, and, I believe, Mambrino. Perhaps no bred horse has ever trotted more than fourteen miles within the hour, excepting Infidel, by Turk, which after he was out of training, about five-and-twenty years since, trotted more than fourteen miles in one hour, carrying ten stone, on the road between Carlisle and Newcastle. A similar match with a race-horse was talked of in the North last year. The reason of their inability is, trotting requires a short quick step, with the knee considerably bent, and those horses outstride the trot, and straighten the knee joint, besides they soon become leg-weary, and their legs and feet are too delicate for the rude hammering of the speedy trot. There is a variety called running trotters which step short, but do not bend the knee so much as the fair trotters, and have a rolling motion, like the racking of former days; speed is generally the best of these. Horses which lunge out with the straight knee, or jump and bound like deer, whatever may be their speed for a few hundred yards, can never be made trotters." In the above reference to the "running trotter" the intention is evidently not to indicate the source of such, but simply to describe what appears to be the motion on either side, while the combined movement results not in a run, but a trot; under the circumstances, as fair a description and use of terms as to call the amble "a walking trot."

Historically Considered.—Stillman, the American literary authority on "the horse in motion," points out that the walk and the trot are the natural unaffected gaits of the horse, *i. e.*, they are the earliest and most decisive gaits of the animal. Later in colt-life the run is acquired. being "affected" by later-born mental ideas, ideas in fact convincing the colt that everything else outside of itself was not really part and parcel of itself—that of some things it behooved it to be suspicious and from which it had better stretch itself.

Bearing in mind the gradual development or evolution of the British breeds, we might thus arrange the gaits:

(The Walk.)	(The Run.)
Slowest and Strongest.	Fastest and Lightest.

Fastest and Strongest.
(The Trot.)

Though we have very lately been told that "the trotter is the draft horse"—in such sense in so far as a horse in harness necessarily draws a wheeled vehicle, this may be accepted—it is not meant by the above table to intimate that the trotter is a combination of half draft and half racer. But it illustrates historically the position of the trotter as the oldest and foundation type of horse from which on one side the horses inclined to the *natural* walking gait became evolved or developed through *natural* gradations eventually into the the great lorry or dray horse—the wonder of the foreigners visiting the British shores; on the other side, the *acquired* running gait became similarly developed into the fastest racing breed—whose earlier designation was the courser—also a wondrous evidence of man's specializing skill.

On the one side, the original Simon pure Cleveland bay, and the Suffolk punch, are the half-ways to the types of Shire and Clyde; on the other the hackney and the Yorkshire coacher may be regarded as the half-way points toward the racer.

The two extremes have become so

Digitized by Google

much apart that there never has been any association in breeding between them. In the whole left-hand series thoroughbred blood would be considered as much out of place as draft blood would have been on the right-hand series. The left-hand series had its origin in whole in the distant past in the "common" stock of Britain.

The right-hand series had similarly its origin in the same ancient stock, *but* in degrees that increased from the latest to the earliest conditions: *i. e.*, on account of the introduction of the oriental, the nearer the thoroughbred top the more there was of this running blood, and the farther removed from the upper crust the less there was of it. At not a distant date, before history was used to interpret the matter, breeds were graded entirely by the amount of thoroughbred blood contained.

From the "courser"-inclined horse was derived the racer, by crossing with the oriental, the while the trotter as such was, it may be said, untouched. It is easy to see how the racer became the favorite and the trotter "dropped a mark or two in quotation." The trot in the diagram appropriates the trunk position, from which the heaviest and lightest parted. And from the "axil" there continued the main branch with all the gathered strength of natural inheritance. The racing breed became thoroughly established as a breed and in the hearts of all. With establishment, in which the original blood had absorbed just such an amount as allowed it to retain considerable of the "bone and bottom" of the foundation blood, any further infusion of oriental blood led to quick, evident, deterioration. Only a certain amount of *determining* blood could be successfully, in deeds, sustained.

That is the lesson taught by the history of the establishment of the thoroughbred. Also of the Orloffs and of every other domestic breed that became "bred."

Now, not so much by predetermination as incidentally (the favorite sires of the day being all exclusively composed of it), the dams of the trotting foundation or origin became mated with such sires of the thoroughbred side. The results were not at first unsatisfactory, far from that, for apparently the feats performed by animals so bred, as given in examples herein, were decidedly better than the old pure trotting stock. Hence the established thoroughbred (which term now excludes the further association with oriental blood) may be regarded as the determining element to a better development in the trotting breed.

We shall follow this up a step more, and here the subject has to break up into two parts: A consideration of the future fate and evolution of the trotting breed in England and America. For in these two countries we see the results, historically, of two systems of breeding. The first is the erroneous system of continuing beyond certain limits with outside or foreign determining blood, as contradistinguished from the (historically correct) system of dropping the further use of the determining influence, as soon as it had made its great mark.

In the former case we see that the continued use of thoroughbred blood was detrimental, insomuch that it did not continue to produce animals wherein great trotting deeds would have materially aided in the direction of such attention as would have become materialized into producing a "rattling" trotting breed. The trotting element was swamped in the treacherous racing adhesiveness.

In America the class of early horses introduced had to rely mostly on the product of "favorite sons" of themselves as sires. The determining foreign element, which had already established the blood in England, was necessarily absent in America as a further resource. Hence, in the latter was a providential system of correct breeding, just as in England there was continued an enforced system of what proved incorrect breeding. The results were as history promised, the perpetuation of trotting in the one country (America), and its degradation in the other (England).

What are the results to-day? They are: Two breeds, of the same derivation, of two entirely different developments. These two breeds are the American trotter and the English hackney. The latter, individually are called "knee actors," the former may be called speed

Digitized by Google

actors. As Professor Wallace remarks, in one of his works, "High fore-leg action may be all very fine in Hyde Park or Regent street, but very high action of this kind is unquestionably a defect when hard and prolonged work is to be done." Just so, the trotter is for masterly activity the hackney for masterly inactivity. We have two elegant breeds of splendid motion—one to *get over* space, the other to *stay in* place. Or, as expressed by one of our most intelligent contemporaries: "One is meant to go, the other to show. The trotter is bred to get out of the way as soon as possible, the hackney is bred to stay in sight as long as possible. Between the trotting horse and the hackney there is no possible conflict of interest. Their planes of action do not intersect."

Such seems truly to be the results, furnished by national history, of the two systems of breeding—the continuance and the discontinuance of the determining blood. As far as the results we wish to attain are concerned, there is only one system sure and secure, that indicated in the history of all developed breeds—the discontinuance, after a certain point, of the use of foreign or determining blood, and the substitution of selection within the limits of the breed itself, of the blood of mating sires and dams that exhibit the form or deeds of the desired standard in the greatest possible degree.

Some Samples.—We shall leave history, or theorizing, if you will, behind now, and give what is said to be better, examples of some "workers."

In a book bearing the date of 1598 the following occurs about the hackneys which even then were famous: "Geldings are now growne to be very dere among us, especially if they be well colored, justly lymned, and have, thereto, an easie ambling pace. For our countrymen—seeking their ease in every corner where it may be had—delight very much in these qualyties, but chiefly in their excellent paces, which—besides that is in manner peculiar unto horses of our soyle, and not hurtful to the rider or owner sitting on their backs—is, moreover, very pleasant and delectable in hys eares; in that the noyse of their well proportioned pase doth yield comfortable sounde as he travelleth by the waye."

How long the Norfolk district of England has been famous for horses good under the saddle or between the shafts it would be difficult to say, but it must be a very long period indeed. In the Paston letters Sir John Paston, when at the wars on the continent, wrote to his wife, Margery, to attend a Norfolk fair and buy there for him three horses "which were trotters." The lady was fully able to execute the commission, and we read of horses arriving and being approved, the cavalier having specially insisted that the horses should be not only strong, but of "a good spirit."

The saddle horses of the district could not only go fast but could go long. It is said that of the mother of Sir Bartle-Frere, a Norfolk worthy, that "being one of a large family the young people would ride twenty miles in an evening to a ball, dance all night, and ride home by breakfast time in the morning." The saddle was their coign of 'vantage.

On Monday, June 7, 1790, a common hack horse, the property of a person near Birmingham, England, trotted for a wager of twenty guineas upon the turnpike road leading from thence to Halesowen, three miles, in twelve minutes five seconds. It then walked three miles in thirty-six minutes fifteen seconds, and next galloped three miles in eight minutes twenty seconds, occupying on the whole task a period of fifty-eight minutes fifty seconds. It had been undertaken that the horse should perform the nine miles within the hour. A lot of money in bets followed the wager, and the excitement toward the close was intense.

On March 29, 1791, occurred a performance which created not a little stir at the time. A wager was made that a pony twelve and one-half hands high would trot thirteen miles with thirteen stone up inside the hour. The little fellow was the property of Mr. John Hole, of Summergangs, and the match took place on the turnpike road between Hull and Beverley. There was a rare sporting assembly, betting was fast and furious. Odds were laid against the pony, but to the astonishment of those not acquainted with her extraordinary abilities, she covered the journey in fifty-five minutes two

Digitized by Google

seconds. The party connected with her netted a considerable sum, and a large figure was refused subsequently for her.

In April, 1792, a Mr. Robinson of Oxford Road made a wager of £500 that he trotted—and would again—two horses thirty-two miles in two hours, on the road between Cambridge and Huntington. He won the bet, but it was a very close shave, there being only but ninety seconds to spare. His most fancy horse trotted at the rate of eighteen miles an hour, and covered no less than twenty-four miles out of the thirty-two.

Great interest was excited by, and much money depended upon a wager which was made by a Mr. Underwood, of Tottenham. He matched a horse of his, under fifteen hands, to go 100 miles in twelve hours—a feat which was performed on Friday, January 22, 1819. The match was for 200 guineas, but the owner staked a lot of money in bets. The start took place two miles from Ball's Pond Gate, down the Huntington Road, and the finish was on the level between that place and Cambridge, the agreement being to go over sixty miles out. The following is the time: The first thirty miles were done in three hours, when the horse halted half an hour and was fed. The next twenty miles were done in two hours, ten minutes; *i. e.*, fifty miles were completed in twenty minutes under half the time. At this stage a seven-stone youth relieved the first rider. Three-quarters of the journey, *i. e.*, seventy-five miles, and the feeding a second time, was done in eight hours thirty-five minutes. The horse was then kept steady at nine miles an hour for the next two hours. After feeding him again, seven miles were left for the last two hours' task, and this was managed "rather cleverly."

Shuffler was not remarkable for very great speed, but so steady a trotter that it was almost impracticable to whip him out of his trot. About the year 1780 Aldridge's brown mare, afterward Bishop's, trotted sixteen miles in fifty-eight minutes and a half, eight miles out and eight home, over the road between London and Epsom, carrying twelve stone, and jockied by Mr. Aldridge, the then proprietor of the Repository, in St. Martin's lane. This performance Lawrence witnessed, and in fact accompanied, and it was the first authentic proof of that distance having ever been trotted within an hour, with twelve stone. In 1791 the same mare, being then eighteen years old, repeated the performance upon the Romford road. In 1792 a five-year-old son of Pretender trotted in Lincolnshire, sixteen miles in fifty-nine minutes, carrying fifteen stone. This is given on newspaper report. The locksmith's gray mare, which Lawrence knew, trotted seventy-two miles in six hours. Archer, so named from Archer, the sheep salesman, who brought him to London, out of Norfolk, trotted about the year 1785, sixteen miles in fifty-four minutes and a half, ridden by Johnson, upward of eleven stone. Archer, perhaps the most capital trotter that has ever appeared in England, up to that date, was killed by this match, the ground being so hard with frost that the excessive shaking induced fever and inflammation in the horse's feet.

The brown mare, Phenomenon, was the second trotter which was tried with jockey weights. In July, 1800, she trotted between Huntingdon and Cambridge, seventeen miles, in fifty-five minutes, carrying a feather. She afterward trotted the same distance in less than fifty-three minutes, ridden by the same boy. She was matched to trot nineteen miles in one hour, and received a hundred guineas forfeit, after which her owner challenged to perform with her nineteen and a half, but it was not accepted. She had beaten the best trotter which could be brought against her, being then fully twenty years old. She was bred in Surrey, and was half Friezland or Flanders. Lawrence it was, it may be here remarked, who first recommended the adoption of racing weights and turf riders in trotting matches in England.

Of such were the foundations of the American breed. But, as indicated, in such state the English breed remained, while the American rapidly developed. The former was bred continually away from itself, the latter continually more toward itself.

The American "Advanced."—In Lawrence's time the English had not a very

Digitized by Google

high appreciation of American horses. By Youatt's it was slightly different, for horsemen had by then appeared, as naturally they were bound to, who had developed the idea of a trotting horse into a reality. The samples just quoted show the state of the trotter, bred according to the prescription indicated by our historical study. As showing the results of the American prescription we have evidence furnished by English writers themselves of the developed American trotter competing with the English bred, on the soil of the latter. "The Americans breed useful hackneys, which very often excel in the trot, of which we have of late years had some extraordinary examples amongst us"—so Blaine put it, 1870.

"In most parts of North America," wrote Mr. Winter, an Englishman, in the first half of the century, "fast trotting horses are esteemed beyond all others. It is the prevalent and fashionable method of testing the powers of their horses, and certainly appears well calculated to establish properties highly useful to the community. The more rapid pace of the gallop is rejected for the more useful one of the trot. The most remarkable trotters that have ever appeared in England were brought from the United States, amongst them Tom Thumb, Rattler, Rochester and Confidence. The Americans properly attack our system of turf-breeding. They say we go for speed, surpassing speed, and, having aimed at this alone for half a century, and still continuing the practice, it will not be surprising if we lose everything else that is valuable," while we may remark it has been the aim of the American, in the trotter, to retain just what is valuable.

We may complete our samples by mentioning the performances of the above mentioned American trotters in England, which first opened the eyes of bluff John Bull to the fact that his management of horseflesh was not destined to remain supreme.

Tom Thumb, styled "a galloway" of about fourteen hands, on Monday, February 2, 1829, performed the wonderful feat of trotting one hundred miles in harness in ten and a half successive hours for a bet of £200 to £100. The event took place on a mile piece of road commencing at the fifth milestone from Staines, into that town and back. The game little horse won, having twenty-three minutes to spare.

The celebrated American trotting horse, Rattler, when the property of Mr. Osbaldiston, was matched against Mr. Paine's American horse, Rochester, Mr. Osbaldiston backing Rattler 1,000 to 500 to trot five miles in harness, which was performed in thirteen minutes and fifty-eight seconds. Mr. Osbaldiston came in first by the length of his carriage.

The trotting match between Rattler and Mr. Lawton's Driver, which had recently performed seventeen miles within the hour at Smitham Bottom, to trot thirty-four miles (seventeen out and seventeen in), is one of those feats which will long live in the memories of the amateurs in this species of racing. Rattler, ridden by "The Squire," came in first by about fifty yards, performing the distance in two hours eighteen minutes and fifty-six seconds. Considering the nature of the road and the condition of the atmosphere, it was altogether a phenomenal performance.

Since then the American trotter has become a much-coveted animal in foreign countries. He is now known all over the world, not only by fame, but by name and dought. He has been transported into every country where horseflesh is appreciated. He holds the records in Britain and various continental countries, as well as in far Australia. A writer in a London contemporary lately remarked that "the increase in popularity of fast trotting is to be welcomed by horse breeders as a new outlet for their industry and skill. Anything that increases the varieties and types of animals is a distinct gain to breeders. The fashion for speedy trotters is a new departure, of which advantage should be taken in its early stage of development."

Similar interest is being taken in the trotter in all other "horse" countries. Now is the time for some patriotic son of America to give the breed a boom in these old countries. The judicious selection of a few flyers, to give those

Digitized by Google

who have never had an opportunity of experiencing it the excitement peculiar to sensational trotting heats, would prove of advantage to breeders generally. The ever great stay-by claim of the trotter as being the horse of business speed, which quality it has under all conditions, has become impressed on everyone abroad.

CHANGES IN THE STANDARD.

BY L. E. CLEMENT.

IN the June number of the MONTHLY appeared an article under the above caption, and I have no question in my own mind but it will be a great surprise to a large number of the readers of the MONTHLY. Are such changes as "A Breeder" suggests necessary or desirable? As well might we cast all rules aside. What we want is more intelligent blending of the standard we have. Breeder says to this end, "I would not admit a new stallion of unknown breeding and no speed merely because he produced twenty-five 2:30 trotters." This would of course do away with the time test altogether.

Under such rules one's horse would die of old age before he could become standard. In the first place he is out of the standard, and as Breeder says, "Let us have rules that will compel breeding to good standard stock, and operate against breeding to poor standard stock." The standard in any of its forms militates against using non-standard stock as sires. So the poor man must first give his horse a 2:30 record, then he must go to work and buy from one to ten producing dams to mate with him, for he must first put five in the 2:30 trotting list before any one else is willing to put up a dollar for a non-standard sire, and if the man is not a financial wreck, the horse is ready to die of old age, and can at most leave but a very small number of valuable standard animals.

The list of rules submitted would drive all breeders not millionaires out of the business. We have a good list of rules, probably as good, all things considered, as will ever be formulated, and we must look to our turf papers, and the auction sales to control the breeding to good and not to poor standard stock.

It is not enough that the horse is a son of Blue Bull or George Wilkes, the two greatest sires of race horses that have yet appeared, but he must as well be standard and sound. If he is backed by a good array of producing dams, all the better. We can not legislate to make breeders of every man who tries it, nor can we always make good teachers of all whose bread and butter depends on the advertising paid for by the owners of blind and unsound stock. There are countries where the mating is controlled by law, and unsound stock is condemned for breeding purposes, but in the United States of America man is permitted to breed to such animals as suit him, and the only control put upon it is in the case of the hybrid which the Ruler of the universe stops with the first crop; thus far shalt thou go and no farther, enjoy thy mule, for he is the creature of thine own production, but he must go out of existence unfruitful.

Mr. Parlin in Boston is very severe on the standard, because rule 7 has been done away with, and such horses as Alexander's Abdallah, whose dam was untraced, and Ethan Allen and Volunteer were not standard under the present rules, they have been of great value, therefore, breeders of trotting horses must use such horses as they were. It is true, with the standard we have been unable to produce one horse that has sired so many trotting race horses, as the old pacer, Blue Bull, he having sired thirteen colts that have won twenty or more winning heats in 2:30 or better, a number not yet reached by any other sire. Twenty-six of his sons have sired and thirty-six daughters have produced, but he was of unknown breeding, and Breeder would not admit such, just because he had sired 2:30 speed. I have noted, in the last year, several colts offered the public that have from four to ten

Digitized by Google

dams that are in the great broodmare list and as high as fourteen producing dams in their pedigrees. Are there not great possibilities in the standard? To the man who has faith in inbreeding there are great opportunities, and to the man who wants more thoroughbred blood we have plenty of the half-and-half kind, that, like Ansel, were driven until they were almost hopeless cripples, and then sent in a couple of match races where it was known he outclassed his opponent, first a pacer, never heard of before (glorious victory), and then a mark of 2:20 that was practically a tin-cup record. We have two strictly thoroughbred horses registered as standard. Although they have never done anything, their daughters should be great goods to breed to these half-and-half sires, for men who can afford such experiments. We can not formulate rules that will make breeders breed as they should. That can only be done by compulsion and by rigid inspection. So great a teacher and writer as Iconoclast openly defends breeding to a blind horse. For my part, if we must make changes in our present rules, I would suggest that a new rule be added: "That every stallion owner be required to have his stallions inspected, at his own expense, by the State Veterinarian of his state, and if not found perfectly sound, that a fine of $100 be assessed against such owner for each and every ervice performed by such horse, and that no stock of such owner, nor get by sires controlled by such owner, be registered until all such fines are paid." Such a rule, I think, would fill a long-felt want. Then men that had such valuable stock as Alcryon, Wilkes Boy, Cheyenne, Allegro, Epaulet, Simmons, and other horses that are well known throughout the country, could race them through the whole season without having them handicapped by stud work.

I, for one, do not believe we need any other change or addition to our present rules than simply to make The Standard and Registered Trotting Horse of America a horse as far as possible, free from any hereditary taint of deformity or unsoundness, and I think the rest will right itself, even if our stallions and mares, when coupled, sometimes produce a 2:20 pacer.

MORE ABOUT THE CLAYS.

PADELFORDS, NEW YORK, June 10.

IN my letter in the MAY MONTHLY I mentioned a number of sons and daughters of old Henry Clay, a horse that with good management would have been, in my opinion, second to no stallion ever foaled, and as of late years his blood has come out prominently in some of our greatest trotters and sires and dams of trotters it is both of interest and value to breeders that any information concerning his lineal descendants be made public. One of his grandsons, owned near here, is the pacer, Star Henry, record 2:28, on a half-mile track. He is one of the handsomest horses in the world and was sired by Andy Johnson, a son of Henry Clay, 8; Andy Johnson's dam by Tormentor, son of a thoroughbred horse; second dam by imported Messenger. Star Henry's first dam was by Sir Henry 285, the sire of Lady Star, 2:24. Sir Henry by Seeley's American Star, dam untraced. As Star Henry is trotting-bred and takes naturally to the pace, perhaps some of the unknown dams in his pedigree were pacers. Last fall in a race at the Ontario county fair Star Henry paced five heats in a race with the chestnut mare Virginia, 2:18. They fought a hard battle and a blanket would have covered them both in some of the heats. Star Henry won the race, best time 2:28. When you get in hot company the Star blood is valuable, a drop of it being worth a bucket full of cold blood. Sir Henry is about fifteen years old and was not driven until he reached the age of ten. He has plenty of life and in a race has never disgraced his breeding, seldom makes a break and there are but few horses that can beat him down the home stretch.

There is another promising young stallion here with the Clay cross, he being Grover Cleveland, by St. Arnaud, and his dam was by Stephen Styles' Henry Clay; he by Chronometer, son of old Henry Clay. This horse is a fast trotter, has gone a number of good races and has a record of about 2:33. We have in this

Digitized by Google

section a good deal of the blood of Gooding's Champion. He was a handsome bay stallion of the Clay family, was a high-tempered, determined horse, and on account of this was supposed to be ugly and was kept in an old log house until ten or twelve years old. He then changed hands and his new owner had no trouble with him. Champion took the first premium at the New York state fair, and his groom told me he took off his blanket 160 times in one day, the horse's box being crowded with people who came to look at him. Castle Boy, a son of Gooding's Champion, has fought some great battles down the grand circuit with Bodine, by Volunteer, and St. James, another son of Champion, has also trotted fast. Mr. Gooding told me that he sold some Champion mares to Senator Stanford of California not many years ago.

Captain Harvey Padelford of this town has a Clay gelding as black as charcoal and with a bald face. He was sired by Hank Clay, son of old Henry, and his dam was by Fashion Clay, another son of the old horse. It is said that his grandam was also sired by Henry Clay. This gelding is only fifteen hands high with the most powerful roach back ever seen, and legs and feet like steel. I saw him the other day hitched double with a draft horse that weighs 1,300 pounds, the team drawing a heavy load of grain on a slippery road. The Clay horse was ahead of the draft animal, taking it very cool and differently from what some of the Clays do, and I then thought of the story of Justin Morgan's great strength.

STEPHEN W. SMITH.

PROBLEMS IN FARRIERY.

BY S. T. H.

Mechanical Action of the Horse.

ONE of the most thoughtful communications the writer has received upon this widely interesting subject comes from a master machinist, whose business is the building of special machinery relating to the more advanced application of electrical power. He loves natural philosophy, admires the trotting horse, and has made his action the subject of his mature study.

His first reflection relates to the method of progression in trotting. He enquires: "Is the body alternately in the "air, and then landed on the two diag-"onal feet? If not, how should the horse "leave the ground in order to make the "greatest flight through the air, in front, "or behind, first?" The instantaneous photograph has made astounding revelations in this field of investigation. No two feet are on the ground precisely at the same instant, whether the action be walking, trotting, racking, pacing or galloping. The ear can not detect the intervals between the rhythms of the footfalls in trotting, nor can the eye discern these distinctive differences of motion. To the most acute ear the off fore and the near hind feet, and *vice versa*, the near fore and the off hind feet, in trotting, strike the ground at the same instant; but the infinitely more sensitive impressions of the snap-shot camera proves that the hind foot strikes first, followed so rapidly by the near fore foot as to be almost instantaneous. This method of locomotion proves very clearly and distinctly that the main propelling power is located in the hind quarters, even if their greater strength, development and leverage power did not furnish indubitable physiological proof of this fact. For this reason the hind feet in balanced action should never be handicapped with heavy shoes. Few horsemen realize the enormous tax upon the muscles by overloading the feet, but it has been stated, as the result of accurate experiment, that an ounce of extra weight at the foot is equal to a pound at the stifle or elbow. Moreover weight causes altitude of motion, and it is a demonstrated principle of mechanics that the nearer the propelling power is kept to its base of action the less the loss of power and the more certain and effective the leverage. High hock action diminishes, just in proportion to its excess, the

Digitized by Google

propelling capacity, and all weight that can be judiciously removed behind militates thus directly to the permanent benefit of the propelling action and its capacity for continuance. Indeed the only necessity for weight in the hind shoes, when the action is balanced, is a sufficiency of stiffness in the web to prevent their spreading in the rear portions from the center of the quarters to the heels. The nails have to be driven far back into the thin quarters to prevent this undue spreading, and, even then, the horn is so thin that often the nails are forced out, bringing with them sections of the lower margin of the wall. For this reason, as well as for many others that will be enumerated in their proper connection, the substitution of tips on the hind feet has often proven of incalculable benefit, for they not only materially lighten the hind foot armament, but they have no rear elongations that can spread to the serious injury of the trotting horse at full speed. Moreover they permit the bars first and frogs afterward to come into direct contact with the ground at every footfall thus preventing slipping and insuring absolute firmness in landing. This gives a reliable, unyielding tread that largely prevents irregularity of articulation, or the slightest twisting, the two main impediments to the perfection of the stroke. The articulation of the hind feet being less than that of the front feet, and consequently the elevation less, it follows that the concussion on the hind feet must be materially less than that to which the front feet are subjected. Hence the less frequent occurrence of quarter crack and corns in the hind feet. For this reason the hind shoes require less variety of patterns. They should be so constructed that they will answer the two essentials of a firm heel landing, and an equally firm toe surface for springing from the ground when the uplifted foot is in position for the next revolution. When the hind action requires quickening and extending, or retarding and shortening, then and then only do the hind shoes require mechanical attachments to subserve these purposes. The revolution of the front foot is greater, the articulation more excessive, the angle at which it strikes the ground more perpendicular and the resultant concussion much more increased than those of the hind feet. For these reasons the front feet require very much more thought in the construction, weight, pattern of their shoes and the adaptation of their means to the more complicated ends to be subserved.

In a general way these explanations will be sufficient to an understanding of the general practice of making the front shoes heavier than the hind ones, without reference to the more subtle questions of accurately balancing the action. But, physiologically speaking, there is another sufficient reason for this difference in weight between the two pairs of shoes. The green feet of nicely dressed hoofs, when taken off at the coronet, will invariably demonstrate on the scales that the front feet will weigh from two to three ounces more than the hind ones. They are broader, fuller over the quarters, and stronger at the toes and inflection of the heels. Nature makes these variations to adapt them to their diversified uses. The greater concussion of the front feet requires a greater capacity of expansion, in order to dissipate the excess of pressure. If the front feet were as narrow as the hind ones, with only the same power of expansion, then the resultant concussion would extend with more direct force up into the inner structures, and navicular arthrititis would be much more common.

In these general observations it is germain to notice the often mooted question: What is the method of foot articulation? Recently it has been stated that instantaneous photography shows the toe strikes the ground first, and then the heel is pressed downward till it reaches its base of support. Others have as stoutly claimed, and among the number the distinguished farrier, Bracey Clark, of England, that the horse lands flat-footed, and that the articulation is confined exclusively to the joints, the hoof having no more action than the shoe.

Manifestly this is a fundamental enquiry, and governs the construction of the shoe. If the foot lands flat, the shoe should be likewise plain and smooth. If the toe strikes first, the shoe should be provided with a broad, firm toe calkin, or

Digitized by Google

some other armament that would give it a firm, substantial contact with the ground. But if the heel presses upon the ground first, then the preliminary consideration is to so construct the posterior branches of the shoe as to bring into play all the rear sections of the hoof that are primary weight bearers.

This important enquiry can only be solved by considering the foot in connection with the entire limb. It is generally conceded that the weight descends perpendicularly through the axes of the bones from the shoulder to the ankle. There it is divided and deflected, one-half passing perpendicularly to the ground, and the other through the axes of the pastern and coffin bones to the ground. Now if the toe struck first, the contact would be at war with the line of direct pressure and of resultant concussion. But this is not all. The alternate lifting and extending of the limb proves that the heels must necessarily strike the ground first. To trace the movement from its inception: The foot is at rest upon the ground. It is lifted by the contraction of the flexor muscle and its tendonous prolongation. That raises the heel first. The contraction of the flexors continue till the foot and limb are elevated to their greatest altitude. *But, obviously, the heel, throughout this movement, is higher than the toe.* The greatest height is reached only when the flexors are contracted to their utmost capacity. While they have been contracting, the flexors have been extending or relaxing to their greatest length. Now, to relieve this strain upon the extensors, the foot and limb are thrown out *and the extreme contraction of the extensors would necessarily elevate the toe and depress the heel*, otherwise the flexors could not be extended to their normal relaxation. The flexors raise the heel higher, because their attachment is at the posterior semilunar ridge of the pedal bone. For a similar reason the extensors elevate the toe higher, because they attach to the anterior face of the same bone. Thus this alternate contraction and expansion of the flexor and extensor muscles, employed in locomotion, furnish the indubitable physiological proof that the heels strike first.

The construction of the hoof furnishes the concluding evidence that the heels reach the ground before the toes. Anterior to the point of the frog the hoof is solid. The firm sole unites with the firmer wall, and the hoof in that section affords no means whatever of breaking the concussion. There is no substance like the yielding frog, with its thin commissures and divided center or cleft. The entire mechanism is solid, and the concussion produced by landing first upon the toes would be largely increased, and thus indescribably painful. Laminitis among swift horses would be the rule, and soundness the exception. When the horse lands upon the heels, the soft frog and dividing cleft permit the walls to expand, thus dissipating the concussion and enabling the flexors to complete their full downward stroke with the least possible friction. As man moves so does the horse. Both land upon the heels, revolve over the center of the feet, and spring from the toes. If the operation is reversed the articulation becomes exceedingly painful. The athletic sprinter accomplishes long distances in quick time by elevating his head and throwing out his chest so that he may land firmly and squarely upon his heels. If he attempts to strike the toes first the extensors are cramped in their contraction, and the flexors confined in their relaxation, so that the articulation is not complete. The extensors thus unnaturally overtaxed would soon become so inflamed that locomotion would become retarded. The greater weight and speed of the horse would very much sooner make him a confirmed cripple if he was thus forced to land upon his toes.

Even the act of walking requires not only that the flexors and extensors shall thus alternately expand and contract, but that they shall contract and relax in the order thus described so as to coöperate with each other to complete every footstep. This coördination is affected by means of the nervous system. In walking the action of the nervous system becomes automatic, and hence unattended with consciousness. But in rapid action the will power must be forcibly exerted to produce the increased momentum. In either instance the law of action is undoubtedly confined to the alternate con-

Google

traction and relaxation of the flexor and extensor muscles as hereinbefore described.

In reference to bringing into harmony the two pairs of feet and limbs, our studious machinist adds: "A machine is no stronger than its weakest point; a horse is no faster than his slowest foot. "Anything that slows up the action of one foot slows up the horse."

Our correspondent overlooks the wide difference between animated mechanism and inanimate machinery; the machine is certainly no stronger than its weakest point. Indeed all the strong portions of a machine in motion seem to combine their strength to develop and break down the weakest point in its construction. But this is not the case in animated mechanism. The mind—or if the term is too strong for some students of psychology among my readers, the brain—of the animal comes to the relief of the weak point, and saves its destruction by a compensating intermediation. For instance: When one foot becomes weak or inflamed with pain, and lameness ensues, the brain, through the agency of the nervous system, throws the burden of pressure upon the other foot that is sound. The invariable method by which an expert locates the lameness is to note the dropping of the head, which is always depressed with the sound foot, because the excess of weight is thus thrown upon that member to the relief of the complaining one. This is only one of many instances that could be enumerated. But it is sufficient to prove that the rigid rule that applies to inanimate machinery does not absolutely govern animated mechanism.

The plausible reflection, "Anything that slows up the action of one foot slows up the horse," is likewise based upon the error of reducing animated mechanism to the rigidity of inanimate machinery.

This is an exceedingly ingenious method of denying the capacity of bringing the front and hind pairs of feet into harmony, even when they are plainly out of effective coöperation. But it is pessimistic in the extreme. If it was true, then the horse, once out of balance, would remain so, despite all remedial mechanical appliances. Moreover it would reduce the horse to the type of a machine, devoid of any higher intelligence than that of a blind, unreasoning muscular power. Its fallacy can be easily demonstrated. Take the short stepping racker and measure his front stride. Replace his light front shoes with heavier ones and arm them with toe weights. The action not only changes from the rack to the trot, but the front stride is measurably lengthened, as the tape line applied to the footprints will show, while the hind stride has not been modified in the slightest degree. All pacers are converted to the trotting action by means of the toe-weight appliance. The toe weight quickens, elevates and extends the front action, so much so that the hind feet can extend up under them without interference, and thus admit of the diagonal instead of the lateral action.

Saddle horses are made, in sections where the harness horse is not practical, by riding the most persistent trotter with bare front feet, and arming the hind feet with shoes, each weighing from one to two pounds. The action in front is thus so materially shortened, and behind so abnormally extended, that the horse can not possibly proceed upon the trot without incurring forging, and speedy cutting, and all the forms of unbalanced, painful locomotion. The animated mechanism thus resorts, for its own comfort, to the pace and the rack, which the inanimate machine can not possibly accomplish; for it has neither brain capacity to govern, sensation to warn, nor comfort nor discomfort to consult. Herein is the radical difference and the absolute failure of strictly proposed analogy between the horse and all machine-illustrations.

If the front action could not be brought into harmony with the hind movement, by mechanical appliances, the number of standard performers would be decimated in one season. When the front action is too slow, foreshortening the toe and leaving the heel comparatively high, while the foot is provided with a rolling motion shoe, will quicken and shorten it, beyond a peradventure, without affecting in the least the hind stroke.

When the rear movement is too long and rapid, the lowering of the heels, and permitting the toe to extend to the full

Digitized by Google

margin of the wall, and then arming the foot with a shoe extending beyond the heels, and provided with oblong heel calkins, will materially retard and shorten the hind stride. The philosophy of the change is apparent upon investigation. The hoof is made longer by dressing. The ground surface is made still longer by the posterior branches of the shoes extending beyond the heels of the hoof. These extensions of the ground surface compel the muscles to raise the weight over a more extended leverage which necessarily retards their expansion and contraction. Moreover the heel calkins cause the hind feet to strike the ground quicker by reason of these posterior elevations, and the landing position of the hind feet is thus thrown farther backward. Having to spring from a less advanced position, the forward extension is just exactly that much reduced.

Now the proof of all these statements is the empirical test. These essential modifications have been accomplished with unbalanced horses without number. To these triumphs of the farrier's art must be accorded the success of many an unpromising colt that afterward became a great trotting performer. Blood and the trainer's art, and the engineer's skill in making race courses, have accomplished wonders with the American trotting horse, but the magnitude of these wonders would be very materially lessened if the art of farriery had not grappled with the myriad forms of unbalanced action, and brought them into that harmonious precision that marks the movements of the very greatest trotting performers.

PROBLEMS IN BREEDING—SEX.

BY A. H.

I. *Remarks Anticipatory.* — Let us hasten to assure the reader that this does not contain one more "theory" that has proved to be infallible in the procuration of either desired sex. Every once in a while such theories appear in the publications devoted to domestic animals. So many of these theories are there that the general student has doubtless long ago come to the conclusion that none of them were worth the paper they were written on, and now passes over each new article on the subject in disgust.

We advise him he had better not do so with this!

"Controlling the sex of animals is as possible as squaring the circle or establishing perpetual motion. The secret of nature's working will never be discovered by man, yet there are cranks who think they have solved the problem." The above is transcribed from a highly respectable journal of the day. Barring the last clause, we disagree *in toto* with "our esteemed contemporary." Even the *controlling* of sex, we feel firmly assured, will be accomplished yet. To use a term which brings it into the position it assumes in experimental observation, the *determination* of sex is in the womb of the explicable. In fact, "nature's workings" can be seen, and easily seen, in a large number of animals. That these are low in the scale makes no difference, the process, like every other, must be very much the same, broadly speaking, as in the higher forms.

Such comments as we have quoted expose not only ignorance, but they depreciate the powers of man and science. Compare the first discovery of heat, or fire, from "the rubbing of two sticks, from which the flame burst as a swift courser," with the appreciable nearness to the production or *control* of heat from electricity (*i. e.*, for purposes in which heat is advantageous). To allow the advance in this case, and deny the possibility in the other, where the process in certain cases is seen clearly to the eye, is, we submit, detrimental to enquiry. The writers of such effusions, however, are only acquainted with the theologic, academic or popular status of the question. Certainly the popular theories have been merely mostly verbal expressions, or have simply begged the question, or have been inconsistent with facts. So that looking at the matter from such contracted standpoint the control of sex does look like one of the impossible tasks man has put himself to unravel.

Digitized by Google

But it is no less an inviting subject of "scientific" observation. The reasons that the investigation has been so long neglected were, partially on account of the (now no longer considered) moral aspect, but principally from the great difficulty of securing observations, especially on the higher animals. But science has its compensations—it applies itself assiduously to what it can observe, willing to wait for developments that will bring the other portions of the field into view. Thus it has made quite a start in this investigation in the numerous results achieved by careful studies of the modes that invertebrate animals (such as bees, butterflies, ants), and also of those of the lower vertebrates (such as the much-utilized tadpoles).

In all these lower animals the process is clearly observable. The lower the animal the less differentiated or specialized is the organism; so it is with the processes, nutritive or reproductive. As the life is short, the influences are great and more appreciable or apparent. It seems strange that in these lower, short-lived forms the processes of the production of the sexes should be so spread out, as it were, that full representatives of intermediate individuals—that are only and rarely hinted at in the higher forms—are developed and have full terms of life and activity. But this is a step in the continuity of the progeny with the parents as seen in the very lowest methods of reproduction or continuity of the species by fission, gemmation, etc. Science, then, has been quietly "laying its pipes," to use a recent phrase, while popular ignorance has been "cutting its wires." With the marvelous developments in every department of the old and new sciences since the advent of Darwin, the apostle of the new revelation, this subject naturally comes forward as a chief question in biology—the study of living things, vegetable or animal. It is now a study of itself, just as is embryology, from which so much has been and has to be yet learned.

"The Evolution of Sex" seems to be the natural titular phraseology circumstances have developed. Under this title what we must call and thankfully regard as the text-book of the language on the subject has been for some time before the scientific world—alone, apparently, for in no "popular" exposition of the subject have we seen any reference to it. This shows how unfortunate many popular "expositors" are. They are out of touch with even the rudiments of science. This prevents them from obtaining an acquaintance with the scientific bibliography of their pet subjects.

"The Evolution of Sex," then, is a work written by Prof. Patrick Geddes and Mr. J. Arthur Thompson, the two leading authorities on the subject. The work is published in this country at a nominal price, and is within the reach of all, and should be owned by every breeder. In twenty-two chapters it deals exhaustively with every phase of the subject in a scientific manner, but in such a way that any reasonably intelligent person "can not fail to understand."

Here we would deprecate the sneers often leveled at scientific language—the "jargon" of science, as it is often called. The "lang nebbit" words of science, with the help of an encyclopediac dictionary, will be found to be particularly valuable to the "popular" student. They express a great deal in very little. If it was not for this advantage science would truly be a "jargon" of words. Scientific words are *key words*—are keys, with a bunch of which what riches may not be opened up! With them a great deal can be carried about so easily in one's head.

Herein we dare not attempt to deal with the whole subject of the evolution of sex as dealt with by these authors. For the sake of skeptics—but more particularly for the benefit of the general breeder, to relieve him of the incubus of the popular theorist who has promised so much and accomplished so little—we beg to introduce him to the consideration of that portion of main interest, "the determination of sex." He will find that science has promised little but accomplished much, and having got rid of "the foolish notion" that he or his horse are special acts of creation, entirely apart from the force of similar influences ruling the rest of animate nature, admitting that he and his horse are but themselves animals, after all, like the meanest creeping thing, he may come to the conclusion that

Digitized by Google

a "good start" has been given the race of investigation against ignorance by the starters (the authors), and that he may "get the tip" that the first-named, in the long run, will win.

We may describe the composition of this article as after the manner of a sandwich. Inside is the meat (our summary of two chapters from the text-book we recommend the breeder to study) and outside, the two slices of "loaf" (our anticipatory and reflective remarks). The meat is certainly of the highest grade, and if the "batch" is home-made, though some may think it too thick, some too thin, each has his choice or judgment.

II. *The Factors Determining Sex.*—The material of the fertilized egg-cell, which in one case develops into a male, in another into a female, is, so far as our experience can go, always the same. *When* the sex of the organism is absolutely decided is a question to which no general answer can be given. In the higher animals it is possible at quite an early date in embryonic life to tell whether the young organism will turn into a male or a female, though in the very earliest stages it is impossible to determine whether the rudiment of the reproductive organs is going to become a testis or an ovary. In lower vertebrates the period of embryonic indifference is greatly prolonged, and it seems that in some cases (as in tadpoles), even after a tendency toward, say maleness, has actually arisen, may, in certain conditions, have this altered in the opposite direction. Among invertebrates, the sexual organs are often late in acquiring definite predominance in favor of either sex; that is, the period of undecided indifference is, as one would expect, usually much longer.

The factors which are influential in determining sex are numerous and come into play at different periods, so that it is quite possible for a germ-cell to have its future fate more than once changed. The constitution of the mother, the nutrition of the ova, the constitution of the father, the state of the male element when fertilization occurs, the embryonic nutrition, and even the larval environment in some cases—these and yet other factors have all to be considered.

Three stages in the individual development of the reproductive organs are distinguished: (1) germiparity, (2) hermaphroditism, (3) differential unisexuality. These have been regarded as parallel to the stages of historic evolution. But even in the first stage, where the elements are still very primitive, the elements in both sexes are almost similar, yet there may be no neutrality or indifference as to sexes, their future fate has been decided. This view as to the invariable existence of an intermediate state, or hermaphroditism, seems to be generally allowed. But one set of elements predominate over the other in the establishment of the normal unisexual state. The higher the organism the earlier is the sexual fate sealed and the rarer the occurrence of hermaphroditism. Among invertebrates and lower vertebrates we see periods of prolonged neutrality of sex, or embryonic hermaphroditism.

What Determines Sex.—At the beginning of last century there were estimated to be over five hundred theories as to the production of sex, and they have gone on increasing. All these may be consigned to the general limbo of forgetfulness.

This subject has been looked at from three different standpoints. (*a*) The theologians were satisfied to say "God made male and female." (*b*) The academics referred the matter to "inherent properties of maleness and femaleness." (*c*) The populars invoked "undefined natural tendencies." All these, of course, are of no account to the biologist. The problem is one for scientific analysis—the constitution, age, nutrition, environment, etc., of parents must be especially considered. The investigations that have been made into these will be considered. (1) Those which are hypothetical, from observation and statistics; (2) those which are rational, from experiment and fact.

The first include those "theories" which may be considered destructive of each other, that is, each new "theory" destroys the preceding. The second are synthetic, that is, each experiment tends to strengthen the rationale of the whole.

First Classification.—The first classification (of theories) we shall very briefly characterize.

(*a*) The theory that there are two kinds

Digitized by Google

of ova*, respectively destined to develop into males or females, is no more than a mere begging of the question. The reasons for this decision are found in the inconsistence of the facts with the theory.

(*b*) The polysperm theory, supposing the entry of many sperms into the ova for the production of males, and few for females, is erroneous. Such a condition is rare or impossible, resulting not in maleness, but in monstrosities.

(*c*) Thury's theory, promulgated in 1863, has run the gauntlet more successfully than any. This theory is: an ovum fertilized soon after liberation tends to produce a female, while an older ovum will rather develop into a male. This theory has met with favor among breeders since. It is worth careful study, as it indicates points of analogy to the facts developed later.†

(*d*) The theory of the age of parents: When the male parent is the older the offspring are preponderatingly male, while if the parents be of the same age, or *a fortiori* if the male parent be the younger, female offspring appear in increasing majority. This theory lacks "unanimity" of results.

(*e*) The theory of comparative vigor of parents, connecting the sex of the offspring with that of the more vigorous parent, is not borne out by the facts of the case.

(*f*) The theory that neither sex is physically the superior, but both are essentially equal in a physiological sense, which though true of the whole, yet in each pair a greater or less degree on one side or other must usually be considered, therefore sex is determined by the superior parent, which produces the opposite sex. This theory has only its verbal simplicity to recommend it.

(*f, g*) The later views of Darwin and Dusing need not be summarized, as they consist of "scientific" leads, which prepared the way for the systematic, synthetic, consideration of the subject of sex in the whole animal kingdom.

The question of the production of twins, especially in the particularly abnormal condition where a free-martin occurs, plays considerable havoc with all the above theories, not being generally taken into account. The further consideration of the question may help to explain this condition.

In the above there is a total lack of scientific general constructiveness.

Second Classification.—We come now, at greater length, to consider our second classification. This includes all that has a regard to the subject as a whole and that necessarily tends, from its simplicities or complexities, to constructively build up a solid, satisfactory result.

We have to now present a *precis* of what has really been accomplished or established in the determination of sex, and the influences affecting that determination, among the most "observable" animals.

Tadpoles.—The verdict arrived at in regard to their behavior is that they pass through a hermaphrodite stage in common (according to other authorities) with most animals. During this phase external influences, and especially food, decide their fate as regards sex, though the hermaphroditism sometimes persists in adult life. Some observers have, however, apparently distinguished among tadpoles three varieties: (*a*) distinct males, (*b*) distinct females, (*c*) hermaphrodites. In the last, testes or male organs develop round primitive ovaries, and if the tadpoles are to become males the inclosed female organs are absorbed.

The following are the striking results of these observations: When the tadpoles were left to themselves the percentage of females was rather in the majority. In three lots the average number of the whole was fifty-seven per cent of females. In the first brood, by feeding one set with beef, the percentage of females was raised from fifty-four to seventy-eight. In the second brood, feeding on fish, the percentage rose from sixty-one to eighty-one. In the third set, when fed on especially nutritious flesh of frogs, the percentage rose from fifty-six to ninety-two. That is, in the last case there were ninety-two females to eight males. These striking results are entitled to great weight and consideration.

Bees.—The case of bees affords one of

*This theory has lately been again advanced by a breeder who is, of course, satisfied that he has settled the matter.

†It appears to be that of the venerable correspondent in the May MONTHLY.

Digitized by Google

the most interesting in the whole animal kingdom. Every one is familiar with the three kinds of inmates of the hive—queens, workers and drones—or fertile females, imperfect females and males. What determines the differences between these three forms? In the first place it is believed that the eggs which give rise to drones are not fertilized, while those that develop into queens and workers have the normal history. But what fate rules the destiny of the latter? What determines whether a given ovum will turn out the possible mother of a new generation, or remain at the lower level of a non-fertile worker? In this case also it seems certain that each particular fate is sealed by the quantity and quality of the food supplied. Royal diet, and plenty of it, develops the reproductive organs of the future queens; sparser and plainer food retards the sexuality of the future workers, in which reproductive organs do not develop. Up to a certain point the nurse-bees can determine the future destiny of their charge by changing the diet, and this in some cases is certainly done. If a larva on the way to become a worker receives by chance some crumbs from the royal store the reproductive function may develop, and what are called fertile workers, to a certain degree above the average abortiveness, result; or by direct intention, a worker grub may be reared into a queen bee.

The queen larvæ get a quantity of fatty material double that given to the workers. The drones at first receive a large percentage of nitrogenous material, but this soon falls below the share which workers and queens obtain. The fatty material, at first large, soon falls to about a third of that given to the queens. Hence the percentage of glucose except at first is so much larger than in the other two cases.

Nutrition, therefore, is the determining influence, in the production of fertile femaleness, and the significant part of the matter is that it is the addition of this food within the first eight days of larval life that develops the striking structural and functional differences between worker and queen. A worker larva, when it is determined to convert the same to a queen, attains with increased sexuality (nutrition), all the several structural and psychological differences which otherwise distinguish a queen. Fertilization being thus regarded as a sort of nutrition, drones, workers and queens may be considered as three terms of a series. This view is corroborated by the development of humble-bees.

Among these the queen-mother, awakened from her winter sleep, makes a nest, collects food, and lays her first brood. These are not too abundantly supplied with food, the queen having to conserve her energy. They develop into small females, workers in a sense, but yet fertile, though only to the extent of producing drones. A second brood of workers is born; these have the advantage of their elder sisters, consequently they are more abundantly nourished, and develop into large females. Still, like the first brood they produce drones, but occasionally females. Finally, with the advantage of two previous broods of small and large females, the future queens are born. These facts emphasize the influence of nutrition on sexuality, and are, as it were, a natural suggestion of the higher specialized society of hive-bees.

Wasps.—In a species of wasp called *Nematus ventricosus*, some careful observations have been made. Here, the fertilized ova, unlike those of hive-bees, develop into males as well as females; while the unfertilized or parthenogenetic* eggs may produce females in a small percentage. The results, as far as ascertained made it clear that the percentage of females increases from spring to August, and then diminishes, indicating that the production of females from fertilized ova increases with temperature and with the food supply, and decreases as they diminish. Other experiments establish a similar result—the more abundant the metabolism,† and the nutrition, the greater tendency there was to the

*Parthenogenesis is the *development without impregnation of an ovum capable of being impregnated.* Harvey's dictum, *Omne vivum ex ova*, has thus to be qualified. Parthenogenesis is common in many insects, and is a subject well worth studying by all interested in the processes of reproduction.

†Metabolism is the term used to express the series of changes—chemical, physical, biological—taking place in the various processes of vegetable and animal nutrition.

Digitized by Google

production of females, which at the beginning and at the end are wholly absent. They only appear when the metabolism and the nutrition were so abundant that the entire development of the young wasps only occupied eighteen or fewer days up to the period of pupation. The peculiarity in this last case is apparently that in parthenogenesis, where the production of males is the normal condition, favorable environmental influences seem to introduce females.

Aphides.—The history of plant lice affords one of the most familiar illustrations of the influence of nutrition on sex, and is indeed full of suggestions in regard to the whole theory of sex and reproduction. These animals multiply so freely, and are of so many varieties (species), that they are particularly convenient to observe. Details may be generalized as follows: During the summer months, with favorable temperature and abundant food, the aphides produce parthenogenetically generation after generation of females. The advent of autumn, however, with its attendant cold and scarcity of food, brings about the birth of males, and the consequent recurrence of strictly sexual reproduction. In the artificial environment of the greenhouse, equivalent to the perpetual summer of warmth and abundant food, the parthenogenetic succession of females has been experimentally observed for four years. It seems, in fact, to continue until the lowering of the temperature and diminution of the food at once reintroduce males and sexual reproduction.

Butterflies and Moths.—If caterpillars are shut up and starved before entering the chrysalis state, the resultant butterflies, or moths, are males, while others of the same brood, highly nourished, come out females. Among moths, innutricious or diseased food produces males.

Crustaceans.—It has been observed that at Marseilles one of the parthenogenetic brine-shrimps (*Artemia salina*) lives in especially favorable conditions, as its large size indicates. There it produces only females. Where the conditions of existence are less prosperous, it produces males as well.

Mammals.—The lower animals are more easily observed. Difficulties appear with the higher, longer-lived animals. Yet there are decisive observations which go to increase the general cumulative results. Thus in an important experiment made on a flock of 300 ewes divided into two equal parts: One-half were extremely well fed, and served by young rams. The other were poorly fed and served by old rams. The proportion of ewe-lambs in the two cases was respectively sixty and forty per cent. In spite of the combination of two factors,* the experiment was a cogent one. It has been noticed, too, that generally it is the heavier ewes which produce ewe-lambs. The females having a more serious reproductive sacrifice, are more dependent on variations of nutrition than males. Even in birds there is a much greater flow of blood to the ovaries than to the testes. The demands are greater, and the consequences therefore more serious if these are not fulfilled.

In the human species the influence of nutrition is hard to estimate. Statistics have seemed to show that after an epidemic or a war the male births are in greater majority than is usually the case. It has been pointed out that females with small placenta and little menstruation bear more boys. It has been contended that the number of males varies with the harvests and prices. In towns, and in prosperous families, there seem to be more females, while in the country the males are more numerous, as also among the poor.

Influence of Temperature.—In the human species it has been noted that more males are born during the colder months. The same results have been reached with horses. The temperature of the time, not of birth but of sex determination, must, of course, be noted. Temperature may have its influence, indirectly, through the nutritive functions.

Summary.—To sum up, a number of factors coöperate in the determination of sex. The most important of these, with increasing penetration of analysis, may be more and more resolved into plus or minus nutrition, operating upon parent, sex elements, embryo, and in some cases larvæ.

*Among some breeders it is considered that it is the young, lusty male that tends to produce males, and the mature, less fervid male, females.

Digitized by Google

Starting with the parent organisms themselves, we find this general conclusion most probable: That adverse circumstances, especially of nutrition, but also including age and the like, tend to the production of males, and the reverse condition favoring females.

As to the reproductive elements, a highly nourished ovum, compared with one less favorably conditioned, in every probability will tend to a female rather than a male development. Fertilization, when the ovum is fresh and vigorous, before waste has begun to set in, will corroborate the same tendency.

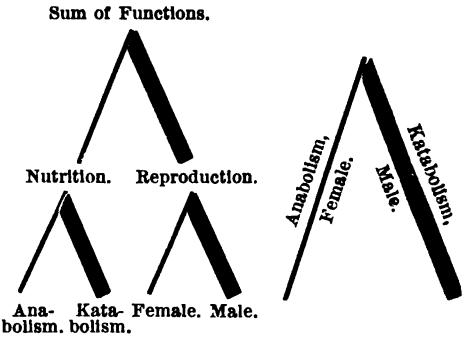
If we accept the opinion as to the transitory hermaphrodite period in most animals, from which the transition to unisexuality is effected by the hypertrophy of the female side or preponderance of the male in respective cases, the vast importance of early environmental influences must be allowed. The longer the period of sexual indifference (though this term be an objectionable one) continues, the more important must be those outside factors, whether directly operative or indirectly through the parent. Here, again, favorable conditions of nutrition, temperature and the like tend toward the production of females; the reverse increases the probability of male preponderance.

The general conclusion, more or less clearly grasped by numerous investigators, is that favorable nutritive conditions tend to produce females and unfavorable nutritive conditions tend to produce males.

The above may be expressed in still more precise language: Such conditions as deficient or abnormal food, extreme temperature, deficient light, moisture and the like are obviously such as would tend to produce a preponderance of waste over repair, which set of factors comprehend what have been included in the term of *katabolic* habit of body, and this habit tends to produce males. Similarly, the opposed set of factors, such as abundant and rich nutrition, favorable temperature, abundant light and moisture, which favor constructive processes, which set of factors comprehend what have been included in the term of an *anabolic** habit of body; and these conditions result in the production of females. Still more shortly put, influences inducing katabolism tend to result in the production of males, those favoring anabolism similarly increase the probability of females.

As a general rule, the result of independent induction, males are forms of smaller size, more active habit, higher temperature, shorter life, in fact, live at high pressure; females are forms larger, more passive or vegetative, lower temperature, longer life, in fact, live at lower pressure. The males are stronger, handsomer, more emotional, simply because they are males, that is, of a more active physiological habit than the females, of whom the converse is true. Males live at a loss, females at a profit. Males and females are resultants of activities exhibiting a predominance of the protoplasmic† processes either on the side of disruption or construction. The male is a begetter, the female a bearer of offspring. In this double parallelism katabolic influences make for the production of males, and anabolic for females. The male is the outcome of katabolism, the female of anabolism.

The above is diagrammatically expressed thus:



III. *Reflective Examples.*—Mr. Everett Millais, a well-known breeder of dogs, contributes a very interesting article to a British periodical on the possibility of

*These terms, *anabolic* and *katabolic* (anabolism, katabolism), are explained in the text below. To fix them in the mind they may be associated with the terms commonly in use, *high* and *low living*, respectively, and in regard to food.

†Protoplasm, "the physical basis of life," is the simplest form of living matter, seen in nature's laboratory where the matter prepared by nutrition is being transformed into the various tissues and in the lowest animals themselves.

Digitized by Google

controlling sex. He quotes some experiments convincive of the possibility of producing males and females at will, by altering the nature of the food, high feeding producing females, and low feeding, males. Mr. Millais adds his experience with his well-known basset bitch, Flora, as supporting this view. When this theory was propounded it occurred to Mr. Millais, as a sort of confirmation, that Flora, who had long been as fat as a pig, had produced all, or nearly all, bitches in her litters. He therefore set to work to reduce her and get her nice and thin for her next heat, keeping her on low diet until after whelping. That litter consisted entirely of dogs. He has since allowed her to get fat, and she has just been bred again. He intends to feed her well again, and he is confident that the resulting litter will contain bitches as before. But one apparent swallow does not make a summer, so we need not build too much yet on these experiments till their number is convincing.

Mr. Robert Bruce, of Darlington, England, well known in stock circles, writing in an American contemporary, remarks: "All practical breeders know that it is much more difficult to breed a good male than a good female, and that in all breeds where, through selection and other means, breeders have been raising the standard of excellence one can breed a much larger proportion of good females than males. For this reason we are inclined to test a breed," he remarks, "by the males and their deeds, rather than by the females."

The above is, we submit, quite interesting. Might it not be taken also as a confirmatory proof of the effect and influence of anabolism and katabolism? Speaking generally, this presents, we believe, an exceptional test of anabolic and katabolic results and tendencies. The facts thus generalized are worth careful attention.

General Remarks.—In the future study of this important sex question we shall have to follow up and in the line of the constructive method, not the destructive; that is, the line suggested by our second classification, not our first. We must study nature more, propound theories less. Life itself depends on nutrition. Reproduction—or better and simpler—fertilization, may itself be called the nutrition of or perpetuation of "life" in the ova. Nutrition is the life of the favored sex—the female. Also, in "well favored"-fed breeds, females are produced of a higher order than males.

The female, from the beginning, is the favored sex. The female rights are paramount. She is accorded the position of relief from toil, and of the highest function of developing the species. All she demands is *nutrition*. Conception is the fertilization or nutrifying of the ova. Reproduction is the result of continued successful nutrition of the "concept."

The higher the animal, the earlier the period of the contact of the male with the female sperm, the earlier therefore is sex determined. In hermaphroditism this period may be prolonged by an equality—a warring—of anabolic and katabolic influences, neither of which gains the superiority in time to determine a decided sexuality.

In lower forms the life period is shorter, is more rapid (to our mind's observation); the influences of high summer are greater. When food and temperature are favorable we obtain the highest results, bringing to the front the favored sex. In higher forms the same general results occur. In domestic animals confusion occurs, because *artificial* environment, artificial anabolism and katabolism supervene. And as these processes have not been interpreted from nature into thought and language and formula the artificial environment has never been manipulated so as to test "the law" for results. Now that it has been formulated, it is to be hoped energies will be enlisted to test it fully and fairly. In the higher animal the determining period is quickly, rapidly passed, while the whole life of the resulting individual is long. This seems an anomaly. One would think that in short-lived animals this period would be short. But the reason may be found by suggesting the idea that the higher the organism the more perfect has its reproductive specialization become; while in the lower forms, the reproductive function or machinery

Digitized by Google

has not attained the quick acquiring powers of the most highly organized, but plods laboriously along—each successive higher organism gaining something, making it more effective the earlier determining end. The lower, however, are compensated by a greater proportional reproduction than the higher. This seems to be another anomaly. But it may be explained by the shorter life and greater work to do, while in the higher the longer life, the more, the longer individual life there is to "do" in.

The aim of nature seems to be, as a main result, to produce conditions amicable to its favored sex—the female—as the highest attainment possible. Various disturbances of nature itself or animal environment, or animal constitution, all may tend to modify this effort. These we must discover and avoid, or control, if possible; the other we must copy if we can.

Female Rights—An Illustrative Diversion.—So that these views place the burning question of female (woman's) rights on a basis not before considered. There is no question about female rights in any portion of the animal kingdom but that of *Homo sapiens.* The rights of the female are everywhere else firmly assured. Why is there such an outcry in the human species? An answer in line with the ideas herein propounded seems ready. *Homo* to-day is the result of civilization. What is civilization but an anabolic process? Civilization—artificial environment—gives all the advantages possible to think of, removes or destroys all the disadvantages of nature. It is intensely anabolic—female producing. Thus it is an argument in favor of our second classification. The result is an overplus of females. This is more evident in the races exhibiting the highest civilization; that is, really the highest regard for the favored sex. So the overplus, not being able to fulfill their grandest destiny, feel the cravings for use, or *profiting;* hence that is exhibited in the peculiar abnormality of demanding equality with the less favored (or male) sex. This is a strange result, this assuming of the katabolic habit by the female. Professor Cope has clearly pointed out the physical and physiological "impediments"—the greater, in fact, the higher the type of the individual—in the way of woman's successful crusading against the appropriation by the less favored sex, of what the favored sex regards as the male monopolization of social and national functions. It is an impossibility. The male assumes the role of the active sex, because it is nature's decree, and *result*—because he is male. Nature shows a partiality—favor—resulting in the female sex, because she is the highest requirement demanded of her.

It is a beautiful scheme. Yet "the female is the martyr of her sex!" Woman's rights, etc., exhibit a tendency to social unsexing—puts the sex on the level of the female worker of certain communities that remain dormant till disaster overtakes the reproducing reigning members, when *one* lucky individual of the workers may be selected and removed from toil, to the highest destiny of the community.

If the female, in domains where anabolism reigns, is dissatisfied with her more passive sex lot, wants reform, she ought to have begun, not with the society she finds herself in (which represent the whole result of the influences that have produced herself), but with her parents. She must begin her revolution not with human civilization, but with eternal nature. It is by the law of nature that the male is the grand majority of nature—the breadwinner, and the female, as it were, the webspinner. The highest result of civilization, the elevation of the weaker sex, and the strict improvement of purity, has resulted in the obscuring, keeping out of view, recognition or consideration of the difference or even existence of sex. The tendency of our teaching is to get to a position where sex is unrealized, and we regard each other as neuters. This, it need not be said, will never be reached as long as nature's term extends. The sooner this is realized the better, and a return to first principles would place this matter on its own basis. Personally the writer has no objection to woman competing with man. How long will it be ere we have a lady Marvin or a Doble? Would they tend to "elevate" the sulkey?

Digitized by Google

The importance of the greater, in our estimation, subject in hand, excuses this interesting diversion. It helps to accentuate the main issue.

Conclusion.—The whole subject is an enticing one. It offers a wide field for investigation and study. It has immense possibilities. A time may come when there may be possible the formation of a breeders' trust, for the purpose of controlling the sexes so as to increase the value of either at will. by issuing an edict for the production of either one or the other. In the meantime we may commend the subject to all breeders who have the means and inclination to follow up the newly suggested lead. To experiment on our highest domestic animals would be somewhat expensive. But on the less expensive more prolific animals, which produce many at a birth, the general effects would be no less apparent and of easy determination. Such a problem would be a good one for Senator Stanford's institution.

It was intended to have indicated some of the bearings of what is known as Weismann's theory of heredity on this subject, which has created such a turmoil, but it is too great an interest in itself to be so treated here summarily.

To conclude: The result of this investigation is to destroy all old theories of sex, and to strongly indicate the existence of a natural law, which is of comparatively easy interpretation, if not control. It is to be hoped those who have the power to do so may find it of advantage to experimentally study the question.

WHAT ARE TROTTING BRED MARES?

BOSTON, MASS., June 10, 1892.

EDITOR OF THE MONTHLY:

IN the May number of the MONTHLY I notice an editorial entitled "What are Trotting Bred Mares?" The article pays special attention to an eastern writer who criticized an editorial in the March MONTHLY, entitled "Trotting Bred Mares Lead."

This article made a comparison between ten of the fastest horses sired by Electioneer out of thoroughbred mares, ten from half-thoroughbred mares, ten from trotting-bred mares, and ten from pacing mares. The tables were complied to show the result of Palo Alto's matings for extreme speed under conditions named, and were intensely interesting to those desiring to know the comparative success of different matings, and what combination of blood lines had produced the highest average speed at the earliest age.

It was shown by the tables presented that at Palo Alto, headed by the great controlling sire Electioneer, the result of breeding the choicest thoroughbred and half-thoroughbred blood that great wealth could purchase and unquestioned ability select that, notwithstanding wealth and selection, the produce from so-called trotting-bred mares led all others both in average speed and at earlier ages.

The writer reviewed those tables with great pleasure and without prejudice, for facts are to him of greater value than theories, and the tables seemed to be facts. Let me say here that I was disappointed that the table as compiled was incorrect, and that at Palo Alto under conditions named, the trotting-bred mares had not produced the fastest average speed and at the earliest ages. But strict justice compelled me to say that an examination of the breeding of six out of ten of the mares called "trotting bred," showed that they would not be accepted as "trotting bred" under rules 7 and 8 of the American Trotting Register, which is the only authority that I can recognize, since it is the standard as laid down by the breeders. The fact that six out of the ten mares named in the table as "trotting bred," were made standard under rule 5 by the performance of their offspring, entitled them to great credit, but it did not entitle them to be called "trotting bred."

I was surprised to find the editor of the MONTHLY, the official organ of the American Trotting Register Association, classing such mares as "trotting bred," and doubly surprised to find him con-

Digitized by Google

tending that the requirements of the register on breeding were not necessary to qualify a mare as "trotting-bred," when comparing the produce of "trotting bred" with the produce of "thoroughbred" and "half thoroughbred."

You called Glencora, dam of Lot Slocum, 2:17½, trotting-bred, when her sire was non-standard, and her dam of unknown breeding. If the dam was of unknown breeding, may she not have been thoroughbred, and her produce entitled to a place in the "half-thoroughbred" table?

The same is true of Addie Lee, dam of Adair, 2:17½. Her sire was non-standard, and her dam of unknown breeding. May she not also have been half thoroughbred? Mark you I do not say they were half thoroughbred. I compiled a fifth table called "Mares non-standard by breeding." into which I placed their produce with the produce of the other four in question.

The next mare, Norma, dam of Norval, 2:17½, you call trotting-bred, and yet her dam was by Sir Wallace, a horse of unknown breeding, though generally claimed to be thoroughbred, while her dam Egletta was strictly thoroughbred, tracing back several generations, making Norma's dam as far as known thoroughbred, and her produce entitled to a place in the "half-thoroughbred table." Campbell's Electioneer, 2:17¾, and Del Mar, 2:20, were both from dams non-standard by breeding, and the blood that flows in the veins of these horses is hot enough to call it largely thoroughbred. Neither of them is entitled to a place in the table of "trotting bred."

I wonder, Mr. Editor, that you did not class Sunol, 2:08¼, as "from trotting-bred," for the percentage of thoroughbred blood in her veins is not greater than is the percentage of thoroughbred blood in the veins of some you call trotting bred.

If you claim that performance of their offspring makes them standard under rule 5, and entitles them to be classed as trotting bred, then please tell me why Dame Winnie (thoroughbred), dam of Palo Alto, 2:08¾, Gertrude Russell, 2:23½, and Big Jim, 2:23½, by Planet, own brother to Exchequer, sire of Lucille, 2:21, and Rigolette, 2:22, is not classed as trotting bred.

If trotting inheritance and performance of offspring entitle a mare to be classed as trotting bred, then certainly thoroughbred Dame Winnie is entitled to that distinction, for on sire and dam's side the blood that supports her is found supporting some of our greatest trotting horses, and yet you class her as thoroughbred, and place her offspring in the table of "thoroughbreds."

Last in the list of horses excluded from the "trotting bred" table, is the great Arion, 2:10¾, at two years of age. You describe this horse and his speed inheritance, and conclude that part of your article with some rather uncomplimentary remarks toward your critic. I will not answer those remarks, for they neither added dignity nor strength to your article, nor would a retort strengthen this, but I do want to say a word about Arion, 2:10¾, and his dam.

Whatever the breeding of Manette, dam of Arion, may prove to be, when the examination now being made is concluded, she is entitled to the distinction of having produced a wonderful son. So far as at present known, Manette is non-standard by breeding, even by the breeding as given in the year book. Her reputed dam, Addie, was sired by a half-thoroughbred horse out of a mare of *unknown* breeding. There is nothing to prove that Addie, wonderful mare that she is, does not possess three-quarters thoroughbred blood; even accept the breeding as given in Palo Alto catalogue, and she has more than half-thoroughbred blood in her veins.

The dam of Arion, 2:10¾, though sired by the great Nutwood, 2:18¾, is not at present entitled to be classed with the produce of trotting-bred mares.

You say while speaking of Mannette, that "A horse may be 'intensely trotting bred,' and still not come within the technical provisions of the 'standard.'" While that may be true in some cases, it seems not strictly true in the case of Manette. Senator Stanford is reported as saying that Manette was a failure at the trot, but could run like a thoroughbred, and for a time was employed as running companion in the education of the trotters at Palo Alto.

Digitized by Google

From what source she inherited her inclination to run, we may only conjecture, but it is evident that it did not unfavorably affect her son. The oft-quoted, "like begets like, or the likeness of some ancestor," we may employ to account for her inclination as Senator Stanford says "to run like a thoroughbred."

Having reviewed the first part of your editorial, I want to say here that I lay no claim to the invention of that which you call "a convenient guillotine for the purpose of decapitation." The inventor of that guillotine and my authority for its use is the association of which you are an honored representative, and if, in using it I have destroyed any idols, possibly it were better that those idols were destroyed than even a seeming injustice be done.

The next part of your article refers to my remarks on that grand broodmare Beautiful Bells. You called her in your first article "that intensely trotting-bred mare," and I said "that, while I would not say one word to detract from the glory that is hers, for I regard Beautiful Bells and her dam, Minnehaha, as the grandest combination of speed-producing dams the world has ever seen, combining with extreme speed, beauty of form and dispositions to be admired; yet, in strict justice I must say that if she is entitled to be called 'intensely trotting-bred' then I do not understand the meaning of those words."

I admitted that she was trotting-bred under the standard rules, and showed that more than half, and probably three-quarters of her blood was thoroughbred blood, which you did not dispute.

To call a mare "intensely trotting-bred" in an article comparing the speed-producing powers of mares "trotting bred," "half thoroughbred" and "thoroughbred," ignoring wholly the percentage of thoroughbred blood in the one you call "intensely trotting bred," when she carried more thoroughbred blood than many you class as "half thoroughbred," is not only unjust to her, but it is also unjust to her offspring, who were handicapped by being forced to appear in comparative tables at a disadvantage, while if the table had been prepared on the basis of percentage of thoroughbred blood in the dams, they would have made a better showing.

I notice in the June MONTHLY you again refer to that "intensely trotting-bred mare Beautiful Bells," and referring to your eastern critic, you again misinterpret the motive that prompted his calling attention to your first editorial.

My criticism of your editorial was for the purpose of having comparison made on the basis of the thoroughbred blood in horses instead of using terms that did not fully express breeding. That purpose was clearly set forth in my article, as the following quotation will show, viz.: "To compile comparative tables that would do justice to blood lines, which, after all, is the only correct basis, for it is the power of the blood that pushes to the front and gives form and finish to the animal, it will be necessary to tabulate on the percentage of thoroughbred blood in dams, classing them as carrying 50, 75 and 100 per cent thoroughbred blood as against dams carrying not over 25 per cent thoroughbred blood, which may properly be classed as "trotting blood." I hope some one will prepare such a set of tables, for they will be very interesting and instructive."

You certainly could not have misunderstood those words, nor my motive in referring to your classification of "intensely trotting bred."

I believe in calling things by their right names, even though they conflict with pet theories.

Let me call your attention again to blood lines, which seem to me to be of vital importance when making comparisons since the terms "trotting bred" and "half thoroughbred" do not correctly express breeding, for one horse may be "thoroughbred" in blood lines, and another "half thoroughbred," and both under the standard, entitled to be called "trotting bred."

The great fountain heads of trotting speed, the horses to which we owe our greatest success, viz.: Rysdyk's Hambletonian and Mambrino Chief, also the great broodmare sire, Mambrino Patchen, as well as others I might name, are

Digitized by Google

classed as trotting bred, and their produce from dams standard by breeding, are entitled to a place in comparative tables as trotting bred, and yet every drop of known blood in their veins is thoroughbred blood, and the unknown blood forms but a small percentage.

The great Electioneer was possessed of splendid trotting action, and his power to transmit that action through all classes of mares has never been equaled, and yet his sire, Hambletonian 10, was a thoroughbred horse as far as known, and his dam, Green Mountain Maid, was sired by Harry Clay 45, out of Shanghai Mary, a mare of unknown breeding, but generally supposed to be a thoroughbred.

Harry Clay has a thoroughbred dam and thoroughbred grandam, his third, fourth and fifth dams were of unknown breeding, while his sixth dam was a thoroughbred. The paternal blood that mingled in his veins was drawn from imported Grand Bashaw, making every known blood line in the Electioneer, thoroughbred blood.

It is not enough to say that the blood described is trotting blood. So was the blood that produced Palo Alto, 2:08¾, which you class as thoroughbred on the dam's side.

There is a distinction between thoroughbred blood which must not be lost sight of. All thoroughbred blood does not blend equally with trotting horses, and the indiscriminate approval or condemnation of thoroughbred blood in union with trotting horses, is equally at fault.

There is no question but that the blood of Mambrino and Bellfounder has been a powerful factor in trotting horses, and without that blood in combination, the greatest progenitor of trotters, Rysdyk's Hambletonian, nor the great Electioneer, who carried a double infusion of Bellfounder blood on both sire and dam side, would not have existed, and yet, Mambrino and Bellfounder were both thoroughbreds.

I need not enlarge upon this, for the student of breeding will quickly name the thoroughbred blood that has proved effective in combination, even where the sire has been other than the great Electioneer.

It is possible that there may exist a strain of thoroughbred blood not yet mingled with the blood of the trotting horse, that when combined may produce greater results than any yet attained. However that may prove to be, we must not forget that all great trotting speed had a large infusion of thoroughbred blood, and that it was by careful selection and combining of thoroughbred with trotting blood, that the inclination to trot and stick to the trot at great speed has been attained and gradually intensified, until we have reached the present type of trotting horses.

The struggle to produce greater speed and fix the type that it may be transmitted, has not ended, nor will it end so long as each year shows a gain in speed.

Since then breeders will combine thoroughbred blood in some quantity with other blood, looking to the production of greater speed at the trot, I trust you will aid them by compiling, or causing to be compiled, comparative tables of horses sired by Electioneer (since his opportunities give greater selection), naming the percentage and source of thoroughbred blood in the dams, substantially as set forth, and give the readers of your valued MONTHLY the benefit of your research.

J. T. L.

IT is always a pleasure to publish in the columns of the MONTHLY intelligent criticism of anything which appears herein, and it is because of its interesting treatment of the subject in hand that space is given the above communication. Nevertheless it may be said that the difference between the views expressed in the MONTHLY and those held by the writer of the above communication, is almost entirely due to the point of observation, and rests wholly upon what the phrase "trotting-bred" may be fairly taken to mean. It was stated in the last issue of this journal that in the ordinary acceptation of the term "trotting-bred," it was not a primal necessity that mares so designated should conform to the requirements of the Register in respect of blood lines, which of themselves would make animals standard. What is meant by ninety-nine men out of a hundred who use the term "trotting-bred" is that the animal to which it is applied, has for ancestors sires and dams that were either themselves trotters, of more than average speed, or members of families which had produced a notable number of trotters, and when this point is appreciated there need not be the slightest difficulty in understanding the position of the MONTHLY

Digitized by Google

in its review of what Electioneer has accomplished on different classes of mares.

Our correspondent, in his consideration of Manette, the dam of Arion, says:

"Her reputed dam, Addie, was sired by a half thoroughbred horse out of a mare of unknown breeding. There is nothing to prove that Addie, wonderful mare that she is, does not possess three-quarters thoroughbred blood, even accepting the breeding as given in the Palo Alto catalogue, and she has more than half thoroughbred blood in her veins."

Then he adds:

"The dam of Arion, 2:10¾, though sired by the great Nutwood, 2:18¾, is not at present entitled to be classed with the produce of trotting-bred mares."

Here are the facts: The dam of Arion is by a trotter with a record of 2:18¾. That horse was by Belmont, who trotted a mile better than 2:30 for the management of Woodburn farm, and out of Miss Russell, a mare that as a three-year-old a great many years ago, trotted a mile in about 2:42; she in turn by the trotter and sire of trotters, Pilot Jr. The dam of Manette was Addie, a trotter that made a record of 2:39 twenty years ago. Now here are a lot of trotting ancestors. Back of them comes the blood of the thoroughbred. The MONTHLY classed Manette as a trotting-bred mare because her immediate ancestors were all members of trotting families, and most of them trotters of more than ordinary speed. It sees nothing to make it recede from that position.

As to Beautiful Bells, the ground in her case has been gone over more than once. Our correspondent says: "I must say that if she is entitled to be called intensely trotting-bred then I do not understand the meaning of those words."

Again the facts: Beautiful Bells has a record of 2:29½, which establishes the fact that she is a standard trotter by performance. She is also standard by breeding. Her sire was The Moor, that made a record of 2:37 twenty years or so ago, and that, according to the testimony of the gentleman who owned him the greater part of his life, was capable of trotting a mile in about 2:32. The Moor was sired by Clay Pilot. This horse was a fast trotter. He was sired by C. M. Clay Jr. 20; dam a filly whose sire was unknown; second dam by Pilot Jr. Cassius M. Clay Jr. 20, was by Cassius M. Clay 18, and out of a mare by a son of Mambrino. He was the sire of four trotters with records better than 2:30. The dam of The Moor was Belle of Wabash, a famous trotting mare whose pedigree was unknown. The dam of Beautiful Bells is the famous matron Minnehaha. This mare, according to the testimony of Mr. L. J. Rose, was a fast trotter in her youth. She was by Stevens' Bald Chief, and out of a mare by C. M. Clay Jr. 22. Stevens' Bald Chief was by Bay Chief, that as a four-year-old trotted half a mile in 1:08. He was by Mambrino Chief. Back of the lines indicated the blood of the thoroughbred predominates, and yet it is left with confidence to fairminded men whether or not, in view of her trotting ancestors, Beautitul Bells may not fairly be termed "intensely trotting-bred."

There is one point, however, regarding which our correspondent makes (unintentially of course) so important a misstatement that it may not with propriety remain unanswered. Says he:

"There is no question but that the blood of Mambrino and Bellfounder has been a powerful factor in trotting horses, and without that blood in combination the greatest progenitor of trotters, Rysdyk's Hambletonian, nor the great Electioneer, who carried a double infusion of Bellfounder blood on both sire and dam's side, would not have existed, and yet Mambrino and Bellfounder were both thoroughbred."

So far as Bellfounder is concerned this statement is entirely unwarranted, as we have yet to learn of any evidence that Bellfounder possessed a drop of thoroughbred blood. On the contrary, while the exact lines of his pedigree are unknown, he is universally credited and known to be a member of what is called the Norfolk trotting family of England. That he was a thoroughbred no other person than our correspondent has ever asserted.

THE LATE M. W. HICKS AND HIS HORSES.

BY L. E. CLEMENT.

DR. M. W. HICKS is dead, and with him has passed away one of the strongest believers in pacing blood in the trotter that has ever lived. In 1875 he threw up a lucrative practice as an M. D., and from that time forward we must write his history from the "Trotting Register." We first find him at page 105, volume III, as the breeder of Buccaneer, black horse, foaled in 1874, got by Iowa Chief, son of Green's Bashaw, dam Tinsley Maid, by Flaxtail (pacer), grandam Fanny Fern, by Irwin's Tuckahoe. On page 113 the brown mare Carlotta, by Flaxtail (pacer), dam Lady Narley, by Marion, son of Mambrino Chief, grandam by John Bull, bred by William Narley, Keokuk, Iowa, owned by Dr. M. W. Hicks. Next page, 140, Comrade, bay horse, by Marion, son of Mambrino Chief, dam Tinsley Maid, by Flaxtail, grandam Fanny Fern, by Irwin's Tuckahoe, bred and owned by Dr. M. W. Hicks. On page 147 we find Corisande, brown mare, by Iowa Chief, son of Green's Bashaw, dam not traced, bred by Joseph Lupton, Lee county, Iowa, owned by Dr. M. W. Hicks, record 2:24½. On page 216 we find Fawn, brown mare, by Marion, son of Mambrino Chief dam Mahaska Belle, by Flaxtail (pacer), grandam Lady Hake, by John Baptiste, g g dam Fanny Fern, bred and

Digitized by Google

owned by M. W. Hicks, and Fern Leaf, (pacer), foaled in 1870, by Flaxtail, dam Fanny Fern, by Irwin's Tuckahoe, bred by T. T. Tinsley, Mahaska county, Iowa, purchased in 1875, by Dr M. W. Hicks. On page 274, Hawkeye Chief, bay horse, by Flaxtail, dam by Iowa Chief, son of Green's Bashaw, bred by C. Seal, Keokuk, Iowa, owned by M. W. Hicks. On page 361, Lady Narley, brown mare, by Marion, son of Mambrino Chief, dam by John Bull, g d Rucer mare, a fast pacer, bred by Rucer Brothers, sold to William Narley, by him to M. W. Hicks. On page 382, Lettie, bay mare, by Wayland Forrest, son of Edwin Forrest, dam Mary, by Flaxtail, bred and owned by Dr. M. W. Hicks. On page 384, Lide (pacer), by Flaxtail, passed through the hands of Dr. Hicks to James Martin, of Keokuk, and also Lightfoot (pacer), by Flaxtail, dam Fanny Fern. Bred by T. T. Tinsley, Mahaska county, Iowa. owned by Dr. M. W. Hicks. On page 389, Little Giant, by Reconstruction, son of Vermont Boy, dam Mary, by Flaxtail, bred by George Lieurance, Mahaska county, Iowa, owned by Dr. M. W. Hicks. On page 395, Lottie, bay mare, by Wayland Forrest, son of Edwin Forrest, dam Prairie Bird, by Flaxtail, bred and owned by M. W. Hicks. On page 411, Mahaska Belle (pacer), by Flaxtail, dam Lady Hake, by John Baptiste, son of Tally Ho Morgan, g d Fanny Fern, bred by T. T. Tinsley, Mahaska county, Iowa, owned by Dr. M. W. Hicks. On page 428, Mary, bay mare, by Flaxtail, dam by a horse called Bright Eyes, bred by George Lieurance. Mahaska county, Iowa, owned by Dr. M. W. Hicks. On page 453, Mischief (pacer), by Young Tuckahoe, son of Flaxtail, dam Lide, by Flaxtail, bred by T. T. Tinsley, Mahaska county. Iowa, foaled the property of Dr. M. W. Hicks. On page 510, Pearl, ch m by Blue Bull, dam Lightfoot, by Flaxtail. bred and owned by Dr. M. W. Hicks. On page 522, Prairie Bird (pacer), by Flaxtail, dam Fashion, by John Baptiste, son of Tally Ho Morgan, g d Fanny Fern, by Irwin's Blind Tuckahoe, bred by T. T. Tinsley, Mahaska county, Iowa, owned by Dr. M. W. Hicks. On page 529, Prompter, bay horse, by Blue Bull, dam Prairie Bird, by Flaxtail, bred and owned by M. W. Hicks. On page 536, Rachel bl m, by Wayland Forrest, dam Lightfoot, by Flaxtail, bred and owned by Dr. M. W. Hicks. On page 571, Sample, bay horse, by Wayland Forrest, dam Tinsley Maid, by Flaxtail, bred and owned by Dr. M. W. Hicks. On page 600, Starlight, bay mare, by Wayland Forrest, dam Mahaska Belle, by Flaxtail, bred and owned by Dr. M. W. Hicks. On page 623, Tinsley Maid (pacer), by Flaxtail, dam Fanny Fern (pacer), bred by T. T. Tinsley, Mahaska county, Iowa; owned by Dr. M. W. Hicks. On page 635, Tuckahoe, ch g, by Flaxtail, dam by John Baptiste, bred by T. T. Tinsley, owned by Dr. M. W. Hicks. On page 636, Twilight, b m, by Wayland Forrest, dam Lide, by Flaxtail, bred and owned by Dr. M. W. Hicks. On page 662, Wayland Forrest, br h, by Alexander's Edwin Forrest, dam (bred by Rev. Jeremiah Wayland, Clark county, Mo.), by Sir Charley, bred by Rev. Jeremiah Wayland, St. Francisville, Mo., owned by Dr. M. W. Hicks. Here we have twenty-four animals bred or owned by Dr. M. W. Hicks previous to his leaving Keokuk, Iowa, for his later home at Sacramento, Cal., and registered in volume III of the "Trotting Register." At this time no standard rules had been formulated, and the Doctor was using the blood of Edwin Forrest that appears in many of our 2:15 and better performers, Blue Bull, the sire of more trotting race horses than any other horse that has ever lived, and Flaxtail and Marion, son of Mambrino Chief. In 1880 the Doctor took a portion of his stock and went to California, farming Flaxtail to a party at La Harpe, Ill., where he died. In 1885, Volume V of the "Register" was published, the first standard rules had been formulated. March 17, 1883, he gave the brown mare, Flight, out of Prairie Bird, by Flaxtail, a record of 2:29, making her mother standard, and her son Prompter is brought forward as standard under rule 6, and Buccaneer is brought forward under rule 4, and they are afterward known as Prompter 2305, and Buccaneer 2656, and on page 188 we find he gave Fawn, by Marion, a record of 2:30½, and she was brought forward

Digitized by Google

under rule 9, as standard. On page 262 we find he gave Pearl, by Blue Bull, a record of 2:32¼, and she was also brought forward as standard under rule 9.

Two more were registered in Volume V. as non-standard. Of the young horses that he took with him to California before the formulating of the standard, Prompter is standard under rules 6 and 4; Buccaneer is standard under rule 4; Sterling, only a yearling when he went out, is standard under rules 4 and 6. Of the mares he took with him to California, Mary, dam of Apex, 2:26, has two producing sons and is in the great broodmare list. Fern Leaf is the dam of three; one of them held the fastest two-year-old stallion record in 1886. Prairie Bird is the dam of Flight, 2:29, and Prompter, sire of three trotters and one pacer. Flight, 2:29, is the dam of Fleet, 2:21¾, and Sid Fleet, 2:26½, and Flirt, by Buccaneer, is the dam of Frou Frou, the fastest yearling yet bred to date. In Volume VII we find fifty-four horses registered as bred or owned by Dr. M. W. Hicks. Is there anywhere in the whole "Register" anything that shows more conclusively the value of pacing blood in the trotter, and is there any breeder that can show such results from stock owned before the formulating of the standard as has been shown by this man who for about six years has been barred by a partial paralyzing of one side from driving his own horses, which he had previously done. The friends of Dr. M. W. Hicks must be glad that he has lived to see the yearling record wrenched from his millionaire neighbor and Electioneer; that he lived to see Shamrock hold the two-year-old stallion record; to see Daisy, by Prompter, so long hold the yearling pacing record, and to see the daughters of Prompter and Buccaneer producers, and the latter in the great broodmare list. Madam Buckner, a mare of unknown breeding, in the great broodmare list, was owned by Dr. Hicks. She was a pacer, and claimed to be by Tom Hal 3000, but the Doctor never believed she was by that horse.

I have studied the success of this man from such stock and wondered at his foresight, or could it be called luck, that sent two daughters of Flaxtail to Rushville to be bred to Blue Bull, or, as he says, seeing old Flaxtail driven to Keokuk to wagon and put into the races, that he should have wanted and obtained so near the whole outfit. Dr. Hicks was eccentric, and in the last years of his life petulant, but he has been a lesson to the breeders of the country and has not lived in vain. The greatest good has come to the breeders in the dispersal of this stock in Indiana and New York after its value has become known, and although the prices obtained were not at all times favorable to the estate, still its use among the new owners, with the climatic changes, will be of untold value in years to come.

TRAINING ROAD HORSES.

BY RAY MARSHALL.

Early maturity is the demand of the times. The quickest development possible is in order to meet the requirements of a busy age. Life is too short to wait five years or more to prepare a road horse for safe and satisfactory work. It is the order of nature that training should go along with growth. In our last article we gave particular attention to the first six months of the colt's training. At this time some hints will be given for its further development. An experience with a pair of nicely matched colts that were developed, driven in the ordinary errands about a stock farm, convinces the writer that a team may be made as trusty at four years of age as at six or seven. The team in question had not the early care desirable, such as was outlined in our previous article. They were never haltered until eighteen months of age. They were never harnessed, either, until fully three years of age. This team, too, had not the advantages of a magnificent inheritance. The dams of both were of the flighty order. One of them having been a cripple at three years of age, was never trained to work, and

Digitized by Google

an effort to "break" at five years of age proved very unsatisfactory, and she is to-day termed on the farm "balky." The dam of the other worked fairly well, but needed to be watched and not to be overloaded, and required also to be started carefully when drawing an unusual load. None but a careful driver, in fact, could be trusted to handle her.

On the other hand the sire (by a brother of Volunteer 55) of these colts in question, was as perfect a horse as any one ever handled. He was a good all-around animal every way. He was true to work on a load, he was ever ready to go at a good gait as a double driving horse, with any mate, and was an exceptionally fine single driver. Added to this he was a saddle horse that carried one easily, and though a stallion, was trusty for any one to use. It may be suggested incidentally here that it is important to know at least that half the blood of the young animal is of the sort desired. If there is much to be had on both sides, all the better. A knowledge of grandparents and farther ancestors adds that much more to one's assurance of success in finding eventually the model road horse. The question may be raised in perusing this article as to the ancestry of these fractious dams. Of the better one of the two it may be said that her sire was an excellent horse representing Mambrino and Sir Archy strains of blood. He was of about 1,200 pounds weight, and a work horse of more than average excellence. The grandsire of this dam was also a docile and tractable horse; was owned by a farmer who worked him regularly to the plow, wagon, carriage, etc. Besides his domestic qualities he was proven later a great race horse, having been sold about the year 1868 for $3,000. He was said to be a near descendant of Diomed and Kentucky Whip. Of the balking mare it may be said that she had for sire a son of Mambrino Chief 11; dam thoroughbred. The balky mare's dam was by the grandsire of the above mentioned mare. So much for blood. Returning to our sample team, the following outline covers their handling: At three years they were first hitched with a trusty work horse, and driven about a week in this way, then they were worked together continually. They were owned on a large stock farm which required ten or fifteen miles driving every day by the manager. It was the rule from the start that they should be driven by no one else than the manager. They had their care in the barn at the hands of ordinary farm help. Once in a great while they were driven a trip to town or the railway station by a farm hand. Almost every day for a year this team was hitched up and unhitched twice or three times. Their driver never used loud or harsh language and petted them almost as he would children by talking in an assuring tone to them whenever there was an occasion of fright. The result was that they came to depend on this assurance and trusted implicitly the word of their driver. They were highly sensitive, and never required the whip more than the slightest tap, when they might hesitate in driving, at sight of some unusual object. Within six months from the time they were first driven they had acquired the habit of indifference to the sights that usually attract young horses' attention. They were, however, from their intelligence, looking carefully for the unusual things of life. Within the seventh, eighth and ninth months of their work they became thoroughly familiar with railway trains, traction engines, such as threshers move on the country roads, and with the exception of the din and roar of the city pavement, they had come to have a thorough experience with life. During the last three months of their year's training it was a great pleasure to drive this team. They seemed to enjoy their daily trips amounting to from ten to fifteen miles in the aggregate, made up of numerous short drives, during which they were stopped, tied, etc. There are several important conditions to be mentioned in connection with the success of this year's work. The team in the first place was fed liberally with oats and rye ground with corn, about in the proportion of two parts of oats, one of rye and one of corn. In addition to this they had a moderate feed of hay, perhaps ten pounds each every day. They were frequently turned out to grass for two or three hours at a time. It seems that this team regarded their abundance of food as a sort of com-

Digitized by Google

pensation for their work, and seemed to enter heartily into sympathy with their driver in an effort to get around and make the trips and get back to the barn. Their physical development was almost perfect, as the food supplied an abundance for repair of decaying muscles, etc.

It was seldom that they felt in the least sore as result of their work. The food, in turn, put them in high spirits, so that the drives were a complementary pleasure. The next important condition of the success of this experiment was the frequent stoppings, hitchings and unhitchings to which they were subjected. It is my belief that with less driving, in the aggregate, and the same amount of handling, in the way of hitching up and harnessing, the same results would have been attained. A further condition of this effort was that they were driven during the first three months almost exclusively on a walk. An effort was made to give them a rapid gait at this pace. From the fourth to the ninth months this gait was varied by a brisk trot at the finish of each drive. It was always the rule, with occasional exceptions, to make them walk the first third or half of a trip. In case they were given an hour at the rate of eight or ten miles per hour, when brought into the stable the boys gave them about one minute to each limb "rubbing down" with a cob and brush. This was designed to prevent any soreness. This article will not permit mention of all the details, but it will suffice to say that during the tenth to the twelfth months their walking gait had been so well established previously that they were ever ready to walk rapidly or to take up the swift trotting gait at ten miles per hour when called upon for this service. Open bridles were used upon them continually, and they were thus familiar with everything fore and aft. Summing it all up in a few words, it may be said that these colts as three-year-olds came to be known as the steadiest, readiest driving team in a large, thickly settled county noted for its abundance of improved live stock. When they were scarcely four years of age they were sold for $500 for a city driving team. Their weight, it may be said, at this time was about 1,070 pounds. Their new owner was a good reinsman, and as long as he drove them himself as four-year-olds there was no trouble. An incompetent driver during the latter part of this year allowed them to run away, which, for a time, seemed to impair their usefulness. Later on they were separated, and became good single drivers, and are to-day true to their early training in most respects, although ten years old. It is our conviction that with the first three years of proper training added, such as is the practice in many places, this team would have been almost incapable of any unruliness as drivers any time after they were four years old. We conversed recently with a physician in St. Louis in regard to a fine four-year-old single driver he was using in the city. He was a man fifty years of age or more, and endorsed fully the theory of early training which is now coming more and more into vogue. In his early experience he bought horses five to seven years of age. These were used by his coachman with the primary idea that they were well broken and needed only a little care to make them safe city drivers. He found the same experience with such horses, in making them reliable and perfect, that many parents find who endeavor to make musicians of their grown-up children. They were too old to learn, apparently. For twenty years it has been his practice, prior to the present time, to buy three-year-old horses, not always securing those having had any farm work or training for a start. Such colts, he says, handled and driven by himself and a trusty coachman, are safer, at the end of six months' driving in the city, than is his usual experience with horses three years older, provided the animal is possessed of intelligence and a good, docile disposition. There are few people in the city who are willing to take a colt and train it. They must have a horse which, with a fortnight's handling by an expert trainer, can be made thoroughly familiar with the city's unusual (to it) noises and other disturbances. The farmer with less than a half dozen colts on his hands every year can, by energy and a purpose to do it, furnish these colts at four or five years of age, and sell at good prices. Only steady, thoughtful attention to systematic work for the youngster all along is re-

Digitized by Google

quired to accomplish this. Many more horses could be sold at fancy prices if only they were known to be safe. A stock farm should establish its trade mark on trusty drivers. The sensible man of the city much prefers to buy his driving horse personally or through an agent direct from the breeder. He then feels that he has some recourse if the article is not as represented. The buyer, too, has much greater assurance that his animals are thoroughly sound as to health and free from blemishes. The situation of a stock farm has something to do with success in this line. If one could be within twenty miles of a city of 100,000 population or more, to which he could drive the teams frequently during the finishing touches of their training, it would be all the better. One need not despair, however, of excellent success, if he lives within ten miles of a city of 2,000 or more population.

In closing this article we would urge upon farmers who have their own boys to assist them the value of the colt's association with the boys on the farm. With suggestions from a wise trainer a boy fifteen to eighteen years of age, where he has tact and a liking for the work, will often accomplish much more in training a yearling and two-year-old colts effectually than will be done by men of middle life or more mature years. A great point to remember is, that skill adds threefold at least to the value of a colt that is rightly bred. There is no reason why the farmer should not employ skill, and reap its result, as well as the city manufacturer. There are not "millions" in it, but there are many thousands to the breeder who studies his work, and who uses for his material the blood that combines with it intelligence, docility, endurance, etc. The market is not alone in the large cities for such horses. Every village has several well-to-do business men who prize a trusty driving horse for their families. It is worth actual money to such a man in time to feel that when his family are out driving that their quest of health is not seriously liable to a catastrophe which may bring speedier sorrow to his home than the dreaded insidious disease which an effort to ward off was the occasion of the pleasure drive. Besides this consideration, the value of trusty, swift horses to professional and business men in furnishing speed and accelerating their buisness, as well as safety to their own lives and comfort to themselves and their families when they are driving about the city, all call for a modern equine that is strong in every conceivable domestic trait.

THE AMERICAN TROTTER IN CONGRESS.

REMARKS OF HON. WALTER I. HAYES, OF IOWA, IN THE HOUSE OF REPRESENTATIVES, WEDNESDAY, JUNE 8, 1892.

The House being in Committee of the Whole on the state of the Union, and having under consideration the bill (H. R. 9089) making appropriations for the Department of Agriculture for the fiscal year ending June 30, 1893—

Mr. HAYES said:

Mr. CHAIRMAN: The present question is a proposition to place in this law the following provision:

That the supervision of the importation of animals for breeding purposes, under paragraph 482 of the act of October 1, 1890, is hereby transferred from the Secretary of the Treasury to the Secretary of Agriculture.

I am opposed to this change. In the execution of this supervision under the law the Secretary of the Treasury conceded his lack of the proper knowledge to handle it and referred it to the Secretary of Agriculture for an expert opinion, and he demonstrated fully as great a lack of knowledge as the Secretary of the Treasury conceded. I think we had better let it alone until we can place it in competent hands, or ourselves so perfect the legislation that the conditions of importation will be fixed by the law itself and nothing left for supervision except detail.

The present law upon the subject is as follows (in McKinley bill):

482. Any animal imported specially for breeding purposes shall be admitted free: *Provided*, That no such animal shall be admitted free except it be pure bred, of a recognized breed, and has been duly registered in

book of record established for that breed: *provided further*, That certificate of such ord and of the pedigree of such animal ll be produced and submitted to the cus- s officer, duly authenticated by the proper todian of such book of record, together h the affidavit of the owner, agent or im- ter that such animal is the identical animal cribed in said certificate of record and ped- ee. The Secretary of the Treasury may scribe such additional regulations as may required for the strict enforcement of this vision.

Acting under this law the Secretary of Treasury, under date of January 22, 92, issued a circular, denominated No. providing regulations for importation der this law, but complaint was made ainst it, and under date of May 2, 92, it was revoked, and a new order de, being No. 66, and the one now in ce. It states that it is done "under advice of the Secretary of Agricult- e," and so far as important to what I ire to say is as follows:

t having been ascertained that animals ich are crossbred, and others with unknown ligrees, have been recorded in certain regis- s, with the sole object of making them gible for free entry into the United States, d as paragraph 482 of the act of October 1, 0, provides that no animal shall be admit- free unless pure bred of a recognized ed, the object of the law being, in the opin- of this Department and the Department of riculture, to exclude from free entry ani- ls not absolutely and strictly pure bred, it hereby directed that on and after June 1, 92, no animal which is brought into the ited States from foreign countries for breed- g purposes shall be admitted free of duty less the importer furnishes a certificate of e record and pedigree in the form hereafter ven, showing that the animal is pure bred d admitted to full registry in a book of ord established for that breed; that both its e and dam were likewise recorded in a book record established for the same breed; and t there have been four successive top crosses recorded sires of that breed on the side of e dam, together with the affidavit of the ner, agent, or importer that such animal is e identical animal described in said certifi- te of record and pedigree.

* * * * *

Unless the certificate of record and pedigree rein provided for is produced the animal all be considered dutiable as not being pure ed of a recognized breed, and duly registered the book of record established for that eed.

In case such certificates are not at hand at- e time of the arrival of the animals, and other idence is produced, satisfactory to the col- ctor, showing that the animals are entitled to ee entry, the collector may so admit them, taking a bond in double the value of the animals for the production of the proper certificate.

In accordance with the recommendation of the Secretary of Agriculture, officers of the customs are hereby directed not to admit animals to free entry unless they are recorded in one of the registers mentioned in this circular.

CHARLES FOSTER, *Secretary.*

AMERICAN BOOKS.

Horses.

Name of breed.	Name of book of record.
Thoroughbred	American Stud Book.
American trotter	American Trott'g Register.
* * *	* * *

This list of registers contains the various ones, American and foreign, not only of horses, but of cattle, sheep, swine and even dogs; but it will be especially observed that the American trotter and the Trotting Register are recognized, but the very provisions of the order in its requirement of four successive top crosses by recorded sires of that breed on the side of the dam effectually shuts them out, debars and outlaws them, for practically there are none that can comply with this requirement.

It is guilty of the absurdity of recognizing the breed, but attaching a condition that is not contained in the standard of the breed itself, and to which few, if any, of the breed have ever yet attained.

In April last my attention was called to this matter through the American Trotting Register Association, and I was requested to try to get the American trotter and the Trotting Register properly recognized, and a letter from Mr. Sinclair, of Toronto, Canada, upon the subject, was sent me, as follows:

TORONTO, *April 28, 1892.*

DEAR SIR: I am in receipt of both your letters regarding the admission of the American Trotter to free entry in both countries, and must thank you for your prompt and practical action in the matter. At the time I wrote you I also communicated with our Minister of Agriculture on the subject, and pointed out that as it took time to evolve the separate families of thoroughbreds, Clydesdales, Cleveland Bays, English shire horse and Suffolk Punches, so it would require time to bring the American trotter up to the same high standard of breeding; that in the meantime, to supplement the short pedigree, an order of merit was adopted as represented by the 2:30 record; that the American Association of Trotting-Horse Breeders was a thoroughly representa-

Digitized by Google

tive body, and had laid down certain rules to designate what constituted an American trotter; that as often as was practicable, without unduly depreciating the value of stock owned by the small breeders and agriculturists, the rules were being made more stringent, and it would only be a few years until the late rule laid down by the American Government could easily be complied with; but that at the present time it was the first duty to protect the values of the stock owned by the general public, and that could be best done by adopting the rules of the American Trotting Register Company "for the free entry of trotting stock into each country for breeding purposes," and that the certificate of the said company should be made sufficient for the said free entry.

I am happy to say that the minister agreed to the proposition at once, and it now rests with Secretary Foster to make it an immediate success. I feel confident the Hon. Mr. HAYES is correct in so thinking, for when the McKinley tariff came into effect the American trotter was not recognized at all, but as soon as Secretary Foster had his attention called to the matter he at once placed him in his proper position among the horse family and adopted your certificate as a good and sufficient standard.

Again thanking you for your prompt attention to the subject, I remain, yours truly,

ANGUS SINCLAIR.

J. H. STEINER, Esq.

I sent this letter of Mr. Sinclair and a letter from Mr. Steiner, Secretary and Registrar of the American Trotting Register Association, to the Secretary of the Treasury, with a request that the matter be investigated and a change made as indicated.

In reply to this I received the following communication:

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
Washington, D. C., May 19, 1892.

SIR: The Department is in receipt, by reference from you, of letters from Mr. J. H. Steiner and Mr. Angus Sinclair, in regard to the free importation of horses for breeding purposes from Canada, under the provisions of paragraph 482 of the act of October 1, 1890.

It is understood from said letters that the writers desire that only a certificate from the Secretary of an American association shall be furnished as a condition precedent to the free entry of animals for such purpose.

In reply thereto, I have to state that the rule for the guidance of customs officers in such matters is contained in Department's circular of the 2d instant (copy herewith), from which you will see that such free entry of animals is permitted upon the certificate of registry of the secretary of any recognized association, foreign or domestic, named in said circular, and upon compliance with the other requirements of said provision of law.

The Department does not contemplate a modification of said circular, as the instructions contained therein were recently adopted after extensive correspondence and consultation with live-stock breeders and importers throughout the United States, and with the Secretary of Agriculture, who furnishes expert advice in such matters.

The inclosures of your letter are herewith returned.

Respectfully yours,

O. L. SPAULDING,
Assistant Secretary.

HON. WALTER I. HAYES,
United States House of Representatives,
Washington, D. C.

Upon receipt of this I sent to the Assistant Secretary of the Treasury the following:

HOUSE OF REPRESENTATIVES
OF THE UNITED STATES,
Washington, D. C., May 20, 1892.

DEAR SIR: Your favor of the 19th instant in relation to regulations as to importations of animals for breeding purposes received. It seems incomprehensible that the Treasury Department of the United States should deliberately strike a blow at the only distinctively American type of horse, and then that in so doing should defend it by a statement that it was upon expert advice of the Secretary of Agriculture. The American trotter is distinctively an American production, is the greatest, grandest, and most useful of all horse breeds or families, and stands among horses as does the American citizen among men, great in fact by reason of actual achievements rather than great merely in theory by reason of effete blood lines.

It is like shutting out Abe Lincoln from some recognition because he could not trace "from successive top-crosses by recorded sires * * * on side of its dam," and giving it to some brainless nincompoop scion of foreign nobility that could fill this as his only requirement. The fact is that this requirement as to four recorded sires on side of dam practically shuts out the American trotter. It would today bar Hambletonian, the greatest trotting progenitor that has ever lived; Electioneer, who has sired more trotters than any stallion, living or dead; Almont, Belmont, Onward, Volunteer, George Wilkes, Happy Medium, Blue Bull, Daniel Lambert, Dictator, Egbert, Black Hawk, Henry Clay, Mambrino Chief, in short, practically all the stars of the trotting firmament, and would hardly leave one to tell the tale.

The fact is this requirement as applied to standard trotters is an absurdity, and there is no reason why they should be barred or discriminated against. I imagine the Secretary of Agriculture has not given any such advice, expert or otherwise, on this question with the standard trotter in mind, and that it was with reference to thoroughbred animals generally that he referred, and I will venture to predict that he will not want to deliberately take this

Digitized by Google

position. I would be very much gratified to have his attention called directly to it.

Yours, very truly,
WALTER I. HAYES.

HON. O. L. SPAULDING,
Assistant Secretary of the Treasury, Washington, D. C.

To this I received the following reply:

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
Washington, D. C., May 24, 1892.

SIR: The Department is in receipt of your letter of the 20th instant, in regard to the Department's circular of May 2, 1892, relative to importation of animals for breeding purposes. The matter will be duly considered by the Department, and you will be advised when a conclusion is reached.

Respectfully yours,
JOHN M. COMSTOCK.
Chief of Division of Customs.

HON. WALTER I. HAYES,
United States House of Representatives.

And later the following:

TREASURY DEPARTMENT,
OFFICE OF THE SECRETARY,
Washington, D. C., June 7, 1892.

SIR: As a reply to your letter of the 20th instant, in regard to the exclusion, by the requirements of the Department's circular of the 2d ultimo, of trotting horses from the privileges of free entry under paragraph 482, act of October 1, 1890, I inclose herewith a copy of a letter from the Secretary of Agriculture, dated the 31st ultimo, in which the matter is fully explained.

Respectfully yours,
O. L. SPAULDING,
Assistant Secretary.

HON. WALTER I. HAYES,
United States House of Representatives.

DEPARTMENT OF AGRICULTURE,
OFFICE OF THE SECRETARY,
Washington, D. C., May 31, 1892.

SIR: I have the honor to acknowledge the receipt of your favor of the 24th instant, inclosing a letter from Hon. WALTER I. HAYES, of the House of Representatives, and one from W. F. Todd, addressed to Senator HALE, both expressing dissatisfaction with the Treasury Department's circular of the 2d instant, in regard to the free importation of animals for breeding purposes. You ask for such comments as may be deemed proper in regard to this subject.

Mr. HAYES expresses astonishment "that the Treasury Department of the United States should deliberately strike a blow at the only distinctive American type of horse and that it should defend such action by the statement that it was upon expert advice of the Secretary of Agriculture." He goes on to say that "the American trotter is distinctively an American production," and that the requirement as to four recorded sires on the side of the dam practically shuts out these horses. He considers this requirement as applied to standard trotters an absurdity, and that there is no reason why they should be barred out or discriminated against.

It should be remembered in considering these regulations, that they are made to carry into effect paragraph 482 of the act of October 1, 1890, which provides that no animal shall be admitted free unless pure bred of a recognized breed. In the regulations there is no discrimination against any breed, but the same rule is made to apply to all. The regulations only require that an animal, to be imported free of duty, should have fifteen-sixteenths of the blood of its breed, and surely if evidence can not be produced to show that an animal has this proportion of pure blood it could not be considered as a pure-bred animal. If, therefore, the American trotter is discriminated against by the regulations, it is the fault of the law under which these are made rather than of this regulations.

The intention of Congress in placing a duty upon imported animals was evidently the protection of American breeders from competition of animals raised in other countries. The exception was made in regard to pure-bred animals for breeding purposes which are imported by our farmers for improving American stock. The standard trotter as Mr. HAYES states, is purely an American production, and there is no country to which our breeders can go and obtain better animals than they can find in the United States. It is consequently unnecessary to import trotting horses to improve our breed, and any animals that are so imported compete with trotters raised by our own breeders, and it is consequently very doubtful if it was the intention of Congress that such animals should be imported free of duty. Under no circumstances can it be considered a blow to the American trotting industry if trotting horses imported into the United States are made dutiable by the regulations; on the other hand, this protects our breeders from competition. It was not, however, my intention to discriminate against the American trotter in the recommendations which I made on this subject, nor do the regulations have this effect. The American Trotting Register is recognized in the list of stud books, and purebred trotting horses can be imported free of duty on the same terms as any other breed of horses.

Referring now to Mr. Todd's letter to Senator HALE, it appears that this gentleman has purchased and fitted up at great expense a stock farm in New Brunswick, where he is raising standard trotters, and that he desires an exception made to the regulations in order that he may sell the product of his stock farm in the markets of the United States, without being subject to duty. It is my opinion that if Mr. Todd's stock are not sufficiently pure bred for him to furnish the proper evidence to secure their entry under the regulations they should be subject to duty the same as any other horses imported into the United States to compete with the products of our own farms. If Mr. Todd takes advantage of the cheap land and cheap labor to be found in the English provinces, spending his money for the improve-

Digitized by Google

ment of a community there located, and paying taxes for the support of a foreign government, I do not see how he can expect an exception to be made in his favor so that the produce of his farm can reach American markets duty free.

As has been said elsewhere in this letter, the standard trotter is a production of the United States. It is not necessary for the improvement of this horse that breeding animals should be brought from other countries, and any trotters placed upon our markets compete with animals bred upon the farms of the United States.

If therefore, trotters are admitted at all under this provision of the tariff law, they should certainly be required to furnish all the evidence of purity of breeding which is demanded in connection with the importation of other breeds of animals.

Very respectfully.

J. M. RUSK.

HON. SECRETARY OF THE TREASURY.

It is surprising that so much error and so little comprehension of the subject can be crowded into one communication as this letter of the Secretary of Agriculture contains. He says that the law provides that no animal shall be admitted unless pure bred of a recognized breed, and that the regulations only require that an animal to be imported free of duty should have fifteen-sixteenths of the blood of the breed, and that if evidence can not be produced to show that an animal has this proportion of pure blood it could not be considered as a pure-bred animal.

The fallacy of all this lies in the facts that most of the families of animals now denominated thoroughbred or pure bred are not natural, but made, built up, and the standard for each is purely arbitrary and more or less stringent, according to circumstances. The thoroughbred horse for instance, next to the trotter the highest type, being founded in part upon the commonest of the common—Flanders draft.

The trotter is by these very rules recognized as a breed, its register adopted, but still its standard is utterly ignored and conditions put in its place that makes compliance practically impossible, and that would shut out every great horse that has made the American trotter illustrious.

In those instances where absolute purity of blood is required, being where the breed is not built up or made, as in Jersey cattle, these rules and reasons would be just as inapplicable, and an imported animal that fully complied with these regulations would not necessarily have any standing, or it or its progeny be admitted to our registers, and if this was all it could show, it and they would be rejected. This shows the absurdity of recognizing a breed on any other standard or basis than that which makes the breed itself. If absolute purity is required, that should be exacted; if, however, the standard of the breed is arbitrary, compliance with this is all that should be required, and the recognized record book should be authority.

Then, again, he takes the position that the duty was put on to protect American breeders from outside competition, and that as the standard trotter is purely an American production there can be no importation that will improve what we have. This is an extremely superficial and erroneous view of the subject. In the first place two of the great trotting families, the Pilot and Royal George, are of Canadian origin, and many, myself included, believe the Morgan is also, and without this very Canadian Pilot blood we would never have had a Maud S., a Jay-Eye-See, a Jack, an Axtell, a Nutwood, or any others of the galaxy of record breakers that trace to Pilot Jr.

The dam of Hambletonian, the greatest of trotting progenitors, was sired by an imported English trotting stallion, and very likely if the doctrine of so-called protection had then been rampant, we would have been robbed by it of our greatest trotting family, to the great loss of our people, as they are now being robbed by it through the very McKinley bill which contains the provision under which these absurd regulations were made.

In view of the rapid strides that Canada, Russia and France are making in trotting, it is by no means improbable that we may yet gain by drawing from them. Then, again, we fear no competition, and the American trotting-horse breeder is not asking any benefit of so-called protection, and is not asking to be allowed to plunder the people through any such system, as are so many of the manufacturing classes. But, upon the

Digitized by Google

ontrary, he knows that his interest, and e interest of the people, as in all other anches of business, is advanced by the llest and freest trade. To-day the eat hope of the American trotting-horse reeder is in building up a foreign deand for our distinctive type of horse, d this demand is stimulated by an opportunity to bring back here for sale and mpetition in our great purses the successful produce of the animals so bought f us.

One of the most successful trotters upn the American turf in 1890 was the allion Alvin, 2:14½; bred in Canada, nd sired by an American stallion out of dam of the Canadian Royal George amily, and who was standard bred under ur then rules, but who would now be hut out under these regulations if deired by an American breeder, notwithtanding his extremely fast record and reat trotting performances. With due respect to the Secretary of Agriculture I will venture to suggest that possibly it might not necessarily be amiss to occaionally import such horses for breeding purposes, and that improvement might be had through it.

The thoroughbred horse is essentially an English production, but climatic outcrosses have made great race-horses, and this country, France, and others have sent this class of horses, bred from its foundation, to England, and successfully competed in its greatest races, and the English breeders have not failed to avail themselves of the blood to our pecuniary advantage, and have not shortsightedly asked for protection or to have them kept out. We may do the same with our trotters if our foreign demand is not discouraged and cut off by this kind of legislation. I know nothing of Mr. Todd's matter except as I get it from the letter of the Secretary of Agriculture, but from what I have said in regard to the status of the American breeder, it is plain to be seen that the position taken by the secretary is simply protection rot run mad.

There is, I believe, to-day more money, more energy and more brains employed in the breeding of the American trotter than in any other branch of high-bred animals in this country, and the product is not only the highest type of horse, but is essentially American as is its use upon the road and track, and it is founded upon the American basis or idea, and still it is discriminated against by our own government and on the theory of protection, while it is fully recognized by the Canadian government, as is shown by Mr. Sinclair's letter. The only consolation is that the same doctrine of protection discriminates against our interests in all directions, and the trotting horse breeder is no worse off than the other farming and producing classes of the country, and perhaps is better off than some, as he does not have to necessarily feed cormorants and favored classes.

I am opposed to adding anything to the power of a department in this matter that has made the demonstration that the agricultural department has here. We can not now wipe out or even materially modify the infamous McKinley law, but we can refrain from extending powers under it, and can "rather bear those ills we have than fly to others that we know not of."—*Congressional Record.*

The Missouri Trotting and Pacing Horse Breeders' Association held their annual meeting for 1891 at Louisiana, Mo., in connection with the regular meeting of the trotting association at that place.

At this meeting, Monocrat, 10612, son of Monitor Prince, 4692, obtained a record of 2:30, but he does not appear in the 2:30 list in the Year Book, for the reason that the secretary of the state association did not forward us a report of their events in time for insertion in the Year Book.

We give below a list of the heat winners, together with their best time made at the meeting:

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, JULY, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
'86, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00
All in one order..... 35.00

Conformation and Speed.

AN exchange says, anent the discussion concerning the fact that trotting-bred pacers go fast enough to win some of the most important races for pacers, and that horses with the so-called "trotting pitch" not infrequently show great speed at the pace: "It must be admitted that the day has come when the theory that pacers and trotters have distinctive formations must be abandoned. Some pacers differ from some trotters in formation. So do trotters differ from each other. No horseman can go to the stables at a big meeting, and, without seeing the horses move, pick the pacers from the trotters by their physical formation. If any horse would be picked out as a pacer, judging by form, it would be Sunol, yet she does not pace, nor does she need weight to keep her from pacing."

The relation of physical conformation among horses to the possession of extreme speed at the trot and pace is one that has compelled the attention of thinking men ever since the possibility of a distinct type of horse which should be known as the trotter was thought of. It was natural, in fact almost inevitable, that, once the subject was given attention, it should have many ramifications, and that some phases of it which at first blush seemed natural and reasonable enough should upon searching exploitation prove wholly untenable. There was nothing strange or outside the limits of probability in the "tape-line theory" anent which a man of clear mind trained to the consideration and elucidation of legal problems wrote a book in the collection of material for which he spent months of time, and yet time has shown that there was absolutely nothing in the idea that physical conformation necessarily has anything to do with the possession of trotting or pacing speed beyond the ordinary. It occurs at once to even the most superficial observer that if the idea had any merit at all it must of necessity comprehend a rule universally applied by nature. Were this the case, it would follow that blood lines would cut no figure in the production of trotting and pacing speed; further than that, after it was discovered what conformation was most frequently associated with such speed, it would of course be only the part of wisdom to endeavor to produce animals of that particular shape and carriage. But each recurring trotting season furnishes innumerable arguments of the most convincing kind as to the utter unreliability of the tape-line idea regarding trotters and pacers. It is true that Sunol, champion from her two-year-old form to the present day, when she stands, in point of speed, at the head of the class, is built largely on the greyhound order, which, as everybody knows, should be an advantage to any racehorse, no matter what the gait at which the animal seeks to annihilate space, but whether, in the case of the trotter and pacer it is of more than supposititious value is questionable.

Goldsmith Maid and Nancy Hanks, hardly out of the pony class so far as inches in height are concerned, are irrefutable proof that size is not necessary to extreme speed, and yet Mr. Doble, who drove both these sensational trotters to their best records, had in Gloster, whose early death robbed the turf of a great performer, a horse that stood seventeen hands high and had brush enough to keep most of the fastest trotters of the present day busy. On this point Mr. Doble says, in a letter to the editor of the MONTHLY: "If I remember rightly, Gloster was a trifle under seventeen hands high, but

Digitized by Google

stood full sixteen hands three and one-half inches, or a little over. He had a wonderful burst of speed, I think in his day greater than Goldsmith Maid, but neither of them compared in that respect with Nancy Hanks, as she has shown me an eighth better than fifteen seconds. I am now speaking of eighths, but when Goldsmith Maid made one of her rushes I doubt if anything could go faster for a few strides, but this part of it is guesswork." "They trot in all shapes" is an aphorism whose truth is never questioned by those whose pleasure it is to attend the great trotting meetings. Mollie Morris and Great Eastern were not far apart in speed for a short distance, although the big son of Walkill Chief had the best record for a mile. Monbars, that as a two-year-old, in 1891 made a record one and a half seconds faster than the 2:18 of Sunol at the same age, is molded on entirely different lines from the nervous, sensitive daughter of Electioneer. It took another Electioneer, the phenomenal Arion, to trot a faster mile as a two-year-old than Monbars, but it can not be said that Arion resembles Sunol in conformation. How inevitable the conclusion then that there is "more trot in the head than the feet," a not wholly accurate way, perhaps, of expressing a great and fundamental truth, but nevertheless a form of expression which covers the ground as well as can be done in an epigrammatic style. All this should have long ago exploded the idea that a "pacing conformation" had, of necessity, anything to do with the production of pacing speed, and when horses that had the "trotting pitch," *i. e.*, were of greater height over the rump than the withers, began pacing fast, there was no longer any room for doubt. Direct, Johnston, Roy Wilkes, Hal Pointer and Cricket, all the pacers in the world that have records of 2:10 or better, are devoid of the "pacing conformation," and all but one of them are trotting bred, in the ordinarily accepted sense of that term. They are likewise widely different in shape, Direct and Cricket being only ponies in height, while Roy Wilkes, although a beautifully modeled horse, is on the chunky order, Hal Pointer and Johnston having finer lines than the others.

In fact the trend of all the evidence afforded by each season's performances by the pacers is not only that those with a large percentage of trotting blood in their veins win a majority of the races for performers at that gait, but it is also true that the "trotting pitch" seems to be of more value to pacers than the "pacing slope," about which so much used to be said in the days when the pacers of the country were few in number and generally what would now be called pacing-bred, in contradistinction to a trotting-bred animal. In other words it appears that so far from a sloping from the withers to the rump being particularly favorable to pacing speed, it does not compare in advantageousness and accelerating power to a well-developed case of "trotting pitch" when applied to a pacing performer. The natural result of greater height at the coupling than over the withers is more driving power, and consequently a higher rate of speed with less exertion. Now that trotting-bred horses with the "trotting pitch" are pacing fast enough to win money in any class, and horses of all possible sizes and shapes are trotting with extreme speed, it would seem more and more improbable than ever that physical conformation has much to do with the possession of trotting and pacing speed.

A California Man's Perplexity.

SACRAMENTO, CAL., June 4.

EDITOR OF THE MONTHLY:

Now that the pacer has been relegated to the shelf (we will not say back seat, for that is doubtful), we presume there will be a short season of peace. Since one man could not run the Register to the satisfaction of the horse breeders of the country it would seem that it had fallen into the right hands when the breeders took charge of it themselves. But it looks as if whenever there is a point to find fault with some one threatens to get up a new Register if it is not corrected to suit the kicker, and the breeders in whose hands the sacred trust has been deposited seem to have been unnecessarily scared. However, it is done, although that the pacer should have been admitted when the standard was first formulated and should never have been excluded is my humble opinion. This view is based on scientific or natural reasons, viz.: the pacing and trotting gaits are interchangeable, and the pacing conformation, when accompanied by a pure trotting instinct and action, produces the very highest rate of speed, as witness Sunol, Maud S. and Allerton.

But now that the pacer is excluded, or classed by himself, let the common-sense, unprejudiced, thinking horse breeders see where we stand and whither we are drifting. The glory of the trotting horse of America is the money we can make on him, but we are drifting into a wrangle, and it is about time to call a halt and stand together. Things have been done that should not have been done, and when one man asks for a special favor it can not be granted without injury to the whole trotting interest (pacing as well) for it is one interest.

Now will the Registrar answer this—not a conundrum? I have a trotting-bred mare by a standard trotting horse. I bred her to a standard trotting horse and she dropped a filly, a pacer, that can go into the 2:25 list of pacers. This filly is already a standard trotter, and is registered as such, but if she paces in 2:25 she is a standard pacer, and the question is, what

Digitized by Google

rank does she confer on her dam? Why, she simply makes her a standard pacer—a mare that never paced a step and is one-half or more thoroughbred, proud as Lucifer, and would scorn to be relegated to a plebian class. She has been my pet for twenty years and I dislike to see her disgraced, but the pacer has gone out of my hands and any one for $2 can disgrace my mare after her filly has paced in 2:25. Now if I should file a protest in the office of the Registrar against the registrati n of the said mare would it be heeded? I am suprosed to be worth $2,000,000 and have $500,000 invested in the horse business, and my happiness in the pastime will be gone if I can not in some way be saved from the pickle which the present rule of the standard has put me in.

PRO PUBLICO.

[The writer of the above communication is laboring under a misapprehension of the application of the standard. If he has a standard-bred trotting mare she can be registered as such and her filly by a registered, standard-bred trotting horse would also be eligible to registration as a standard trotter, notwithstanding the fact that she obtains a record of 2:25 pacing. The filly would be eligible to registration as a standard pacer on account of her pacing record of 2:25, and her dam would also be eligible to registration as a standard pacer on account of having produced a 2:25 pacer. Surely the filly and her dam would not be disgraced by being registered under both standards, but neither is obliged to be registered in both; the owner may take his preference. The filly, having made herself eligible to standard pacing rank by her performance, could be registered in that department without her dam being registered at all, and if her dam is already registered as a standard trotter the fact of her produce pacing does not take from her that rank. We do not think that there is any danger of any one paying $2 for registering the dam as a pacer when her registration is not necessary to affect the registration of the filly as a pacer.—ED. MONTHLY.]

Don't Overlook the Patchens.

IN these days when it is considered rather an ordinary performance, and certainly one not eliciting any enthusiasm, for a stallion to make a record of 2:20 or better, a good many people pay no attention, or rather do not seek to inform themselves concerning the racehorse qualities of George M. Patchen, whose mark is only 2:23½, but it was made a great many years ago, and at the time of going on the books Patchen was not only the champion stallion of his day, but was deemed a worthy competitor of Flora Temple, the unquestioned monarch of the trotting turf. It was after he had placed himself at the head of all trotting stallions that Patchen first trotted against Flora Temple, and although he was unable to beat her he made the little mare go three heats in 2:21, 2:24, 2:21½, about the best race ever trotted up to that time, and in none of the heats was Patchen beaten more than half a length. He subsequently defeated Flora at two-mile heats, the fastest one being 4:53¼, and after that they trotted a good many races together, most of them of the hippodrome order. It was after this sort of a campaign that Patchen went into the stud, and in judging of what he accomplished in the breeding ranks it should be borne in mind all the time that if there is anything in the theory that a stallion's vitality is depleted by excessive racing, George M. Patchen was undoubtedly a victim of the system then in vogue, because in addition to trotting a great many races, a considerable proportion of which were at two-mile heats, he was during the greater part of his turf career trained by men who believed in giving a trotter an amount of work that would now be considered the height of foolishness. With all these facts in view it is not surprising that he sired only four trotters with records of 2:30 or better, and this showing is better than it looks on its face, because Patchen died in 1864, at which time but little attention was paid to the breeding of trotters. And yet with all these handicaps Patchen got in Lucy a mare that trotted to a record of 2:18¼, and that in the breeding ranks proved her worth in the most conclusive manner, as all her progeny are producing speed, one of her daughters having five trotters in the 2:30 list, in addition to which she is the grandam of another trotter with a record of 2:29½. It is only when one considers the lack of opportunity and other disadvantages under which old-time trotting stallions labored, that a fair estimate of their merits as sires can be made, and although in the production of 2:30 speed in the first generation George M. Patchen does not, numerically, bear any comparison with stallions of the present day, it should be remembered that twelve of his sons have sired forty-eight trotters and one pacer with standard records, while five of his daughters have produced six 2:30 or better trotters. One of his sons, George M. Patchen Jr. 31, also known as California Patchen, has, in addition to ten trotters in the 2:30 list, one of them with a record of 2:18¾, also given the breeding ranks ten producing sons that have nineteen

Digitized by Google

trotters and one pacer to their credit, while eleven of his daughters have produced twelve trotters and two pacers, four of them with records better than 2:20. Henry B. Patchen, a son of George M. Patchen, would be famous had he sired no other horse than his daughter Emeline, that is the dam of seven 2:30 or better trotters, while one of her sons is a sire of standard speed, and her daughters have already produced three trotters with records better than 2:30, one of them having a mark of 2:17¼. It is by these lines that are somewhat remote from the family fountain head that the individual greatness of George M. Patchen and the influence which his blood has had upon trotting history must be determined, and when such facts are considered it is plain that like his old competitor, George Wilkes, his name will ever be a prominent one in the annals of the light-harness horse of America.

Evolution of the Trotter.

"ICONOCLAST," who has ever been a sturdy advocate of the idea that the proper blood for the pedigrees of horses bred in the hope of producing trotters should be that of ancestors who have given evidence of speed at the trot, has naturally on many occasions fallen foul of the school of breeders who contend that close crosses of thoroughbred blood are not necessarily injurious. It has been noted and commented upon in these columns that thus far the most striking arguments in favor of the theory advanced by these gentlemen have been furnished by the get of Electioneer, a stallion whose equal as an action controller has never been seen, and who before his death demonstrated conclusively that he possessed the power of siring extreme trotting speed from widely different classes of mares in respect of blood lines, as from a thoroughbred he got Palo Alto, 2:08¾; from a mare whose dam was thoroughbred he sired Sunol, 2:08¼; from a trotting-bred mare got Arion, 2:10¾ at two years; and from what may fairly be termed a pacing-bred mare sired Wildflower that for seven years held the two-year-old trotting championship with a record of 2:21, and Mazanita, whose four-year-old record of 2:16 was the best for its age at the time it was made. Those who advocate close crosses of thoroughbred blood in the pedigrees of trotters have always contended that such strains gave an element of stamina to horses which possessed them, and that this stamina, staying power, gameness or whatever it may be called, was of a superior quality to that furnished by any other sort of blood, the reason being based on the argument that inasmuch as thoroughbred horses had for hundreds of years been trained to assume and maintain a high rate of speed at the gallop, they had also acquired a certain conformation which best fitted them for great flights of speed. From this premise it followed naturally enough that thoroughbred blood would give to trotters physical conformation of the best type for trotting fast and also endow them with superior will power and determination to excel in point of speed. There is no doubt that this contention is a well-founded one, providing, however, that the natural tendency of a running-bred horse to break into a run when asked for an increased rate of speed is so nullified by the influence of a trotting sire that there ensues the ideal combination which results in unlimited ambition to go fast and the inherent tendency to stick closely to the trot when making an extra exertion for speed. "Iconoclast" puts one phase of this very aptly when he says:

"Foundation blood should be the best possible. At the time we began breeding trotters in this country our best horse was the thoroughbred. This was in the days of the old four-miler, before it was dreamed of running thoroughbreds the short races that are now in vogue and that have done so much to deteriorate the old-fashioned blood. But every year we are selecting and developing with as much care and skill as were ever applied to the thoroughbred. The consequence has been that from pure trotting families we are producing a better class of trotting race horses than the world has ever before seen. Nancy Hanks is as good a race mare as was Flora Temple or Goldsmith Maid, and very much faster. Either Allerton or Temple Bar is as good a race horse as Dexter, and one of the two is almost certainly, and the other very probably, considerably faster."

This puts the matter very fairly indeed, and the conclusion is inevitable that while nobody can consistently object to the use of thoroughbred blood as the foundation, there are not many trotting stallions that can be depended upon, as could Electioneer, to, in a large percentage of cases, overcome the inherited instincts of generations of breeding for running alone, and while retaining the good qualities of the running horse, so convert and control the gait of his descendants that they will stick to the trot. There may and probably will be,

Digitized by Google

in the near future, other horses that will rival Electioneer, and very possibly excel him, in this matter of getting level-headed trotters from thoroughbred and half-thoroughbred mares, but up to the present time breeding in such lines is necessarily in a great measure experimental.

Training the Colts.

THIS promises to be a great season for the Axtell branch of the Wilkes family, as Axtell himself, William L., his sire, and at least one phenomenally fast son of Axtell, the two-year-old colt Axle, are in training, and thus far only the most flattering results have been obtained in the case of each. There is certainly no reason why the sire of Axtell should not take a low record, provided he is able to stand the necessary work, as his full brother, Guy Wilkes, was a remarkably fast horse and a good campaigner when on the turf, his record of 2:15¼ proving the first part of the proposition and the record books showing the latter half to be true. Guy Wilkes and William L., come of performing strains, their sire, George Wilkes, needing no eulogy in this respect, while their dam, a daughter of Mambrino Patchen, is out of the American Star mare Lady Dunn, who, when bred to George Wilkes gave the trotting turf a very consistent, reliable and speedy trotter in the gray gelding Joe Bunker, 2:19¼, that now in his old age is enjoying a life of ease in a Kentucky blue grass pasture. Lady Dunn was a famous road mare, both in New York and in Cincinnati, whither she was taken when tolerably well along in years, and there can be no doubt that something of the success of Guy Wilkes as a trotter and a sire as well as the race-horse qualities on more than one occasion shown by him and Joe Bunker were measurably due to the vim and speed of the gray mare that figures so conspicuously in their pedigrees.

William L., is not, in some respects, as truly made a horse as Guy Wilkes, but when the difference of two years in their ages is considered, William L. being the younger of the pair, it must be admitted that he holds his own well with his brother in the matter of siring speed, and for that matter it would be hard to find many horses foaled in 1882 or later that at the close of 1891 had two trotters and one pacer in the list whose records average 2:18⅔, which is the position in which Axtell, 2:12, Emperor Wilkes, 2:20¾, and the pacer Alexis, 2:23¼, have placed William L. Guy Wilkes has ten trotters and two pacers in the list with an average record of 2:21, and in Sable Wilkes he has a fine instance of the breeding-on quality that is so greatly to be desired in stallions, that horse, himself a record breaker at three years of age, adding to his fame while scarcely out of colthood, by siring Freedom, the first yearling trotter to beat 2:30. Should William L. make himself standard by performance this season, as he is expected to do, it is beyond reasonable doubt that the chain of performances in his line of descent will be complete, as Axtell is a star with a three-year-old record of 2:12, and his son Axle, a two-year-old, has already shown an eighth of a mile in record breaking time, and a quarter in thirty-four seconds, a 2:16 clip. A full mile in 2:34½ was placed to his credit the first time he was asked to go that distance, in itself a great performance.

This was done with Doble in the sulky, an assurance that at no time was the colt up to his limit of speed, and means much, for it was Doble who took Monbars last season as a two-year-old, made him the greatest race-horse trotter of that age ever seen, drove him to a mark of 2:18 over a track that on the day of the performance was not fast, and turned him over to his ex-lieutenant, George Starr, in such apple-pie order, that after the colt had been taken to California and gone a mile over the Stockton kite in 2:16½ he was as sound as the day he was foaled.

Now that men like Doble have taken up the training of colt trotters in earnest, we shall see grand results—are already seeing them—from that class of trotters, and the idea prevalent in some quarters that in order to obtain the best results from baby trotters their work must be confined to short brushes at top speed, frequently repeated, is likely to be modified, because Doble does not follow that plan to anything like the extent that has been common among colt trainers, his system being to give a colt plenty of slow miles with a sharp brush at the finish, thus gradually increasing his ability to go a distance at a little better speed all the time. Nothing like as many colts are ruined in the breaker's and trainer's hands as was the case only a few years ago, because the men who were acknowledged to be the best trainers and drivers handled none but age horses, it being only within the last half decade that Doble, Turner, Splan and others

Digitized by Google

the front rank have taken young trotters in their stables. Indeed, it was not until the establishment of rich stakes for colts opened their eyes to the inevitable trend of events that they considered the matter at all, but it was soon apparent that the tide of success was in the direction of young trotters, and they were obliged to join the procession or leave the business a monopoly for Goldsmith and Marvin in California. The old-time style of training colts whereby more than half the animals three years old and under were ruined, has gone for good, it being now an established fact that with proper care and intelligent treatment there is no more danger in working young horses than old ones. But it is unquestionably true that the colts are each season claiming a greater share of the events on the programs at the big trotting meetings in the West, not a day passing but that there is a race for trotters or pacers four years old or under, and the East is beginning to follow suit.

When the yearling record for trotters is 2:25¼, that for two-year-olds 2:10¾, for three-year-olds 2:10½ and the same figure for four-year-olds, it is idle to assert that in the matter of speed the young trotters are not able to give a satisfactory exhibition, and in these days no owner can afford to wait until a horse is four or five years old before ascertaining whether or not it has speed of the remunerative order. It is a settled fact that from now on the handling of colts for speed will begin with their being broken (and in many cases developed), as yearlings, and those which do not make satisfactory performances after they have been given two seasons of intelligent management will as a rule be for sale at moderate prices, because breeding without the ability to perform or produce is a quality that must inevitably become less and less valuable as the number of performing and producing trotters continues year by year to increase.

Great Broodmare Blood.

NEARLY all the daughters of Pilot Jr. that have produced 2:30 or better speed are in the the table of Great Broodmares, which fact is perhaps as strong evidence as could be produced of the prepotency of the Pilot Jr. blood. More than this, the Pilot Jr. mares, according to their number and opportunity, not only excel those of any other family in respect of producing 2:30 speed, but are also in the lead when the test is 2:20 or better capacity in their progeny. All told, sixteen daughters of Pilot Jr. have given to the turf thirty-four trotters with records of 2:30 or better, and among them are seven with records of 2:20 or better, they being Pilot Boy, Maud S., Nutwood, Electricity, Jay Eye See, Mambrino Gift and Viking, whose average record is 2:16¼. This is certainly a phenomenal showing, especially when it is considered that as Pilot Jr. died twenty-seven years ago it is plain that his daughters had nothing like the opportunity of being mated with well-bred and tested stallions, both on the turf and in the breeding ranks, that is now given to mares of the higher class. The showing in this matter of producing 2:20 or better trotters made by the daughters of Pilot Jr. was so remarkable that the writer was led to an investigation of the records with a view of obtaining a list of all stallions with ten or more producing daughters, and comparing them and their works with the Pilot Jr. mares. The stallions, ten or more of whose daughters have produced 2:30 or better trotting speed, or 2:25 or better pacing speed, together with the number of producing daughters to the credit of each, and the total number of trotters of which those daughters are the dams, are as follows:

Name.	*Pro. Dau.*	*No. in List.*

A casual examination of this list, which is arranged alphabetically, suggests at once that further exploitation of the subject would reveal some very interesting facts in respect of the percentage of speed per mare produced by the daughters of the various stallions included therein. In order to show this in convenient form, however, it is necessary that the stallions be arranged in order of merit from this point of view instead of alphabetically or in order of the number of producing daughters, under which latter system Rysdyk's Hambletonian would be at the head, with Mambrino Patchen second. Of course when number is the test, Hambletonian, other things being equal, ought to lead, because he is not only one of the oldest horses in the list, but his opportunities in the stud were greater than those of any stallion that preceded or was contemporaneous with him. It is beyond dispute that the percentage test is as fair a one as can be made, as, no matter whether the number of producing daughters to the credit of a stallion be great or small the average number of standard trotters or pacers produced by each of his daughters gives him exact justice as compared with every other horse. Putting the matter in this shape, we find that the list runs as follows:

Name.	*Pro. Dau.*	*No in. List.*	*Percentage.*
Pilot Jr	16	34	2⅛
Harry Clay 45	15	26	1 11-15
Jay Gould	13	21	1 8-13
John Dillard	12	18	1½
Kentucky Clay	10	15	1½
Blackwood	10	14	1 2-5
Messenger Duroc	15	21	1 2-5
Alexander's Abdallah	26	36	1 5-13
Belmont	26	36	1 5-13
Woodford Mambrino	17	24	1 7-17
Dictator	14	19	1 5-14
Mambrino Chief	17	23	1 6-17
Hambletonian (Whipple's)	11	15	1 4-11
Clark Chief	15	20	1⅓
Enfield	15	20	1⅓
Alexander's Norman	12	16	1⅓
Almont	36	46	1 5-18
Mambrino Chief Jr. (Fisk's)	10	13	1 3-10
G. M. Patchen Jr. 31	11	14	1 3-11
Hambletonian 10	59	74	1 15-59
American Star	36	45	1¼
Cuyler	16	20	1¼
Hamlet	12	15	1¼
Mambrino Pilot	12	15	1¼
George Wilkes	34	42	1 8-34
Harold	19	23	1 4-19
Arthurton	10	12	1 1-5
Edward Everett	10	12	1 1-5
Edwin Forrest	10	12	1 1-5
Mambrino Boy	10	12	1 1-5
Mambrino Patchen	52	62	1 5-26
Green's Bashaw	22	26	1 2-11
Strathmore	22	26	1 2-11
Daniel Lambert	23	27	1 4-23
American Clay	24	28	1 1-6
Princeps	14	16	1 1-7
Blue Bull	36	41	1 5-36
Ethan Allen	16	18	1 1-8
General Knox	16	18	1 1-8
Sentinel	10	11	1 1-10
Strader's C. M. Clay	22	24	1 1-11
Hiatoga (Scott's)	11	12	1 1-11
Happy Medium	14	15	1 1-14
Volunteer	29	31	1 2-29
Administrator	16	17	1 1-16
Nutwood	16	17	1 1-16
Magna Charta	20	21	1 1-20
Electioneer	13	13	1
Ashland Chief	10	10	1

In respect of percentage, it will be noticed that Pilot Jr. is far and away ahead of every other horse, his daughters that have produced standard speed at either the trot or pace having 2⅛ to their credit, while the daughters of the next nearest horse, Harry Clay 45, are only within hailing distance with an average of a trifle less than 1¾. This places the Pilot Jr. and Clay families unquestionably at the head in the female line when the percentage of speed production by daughters is the basis from which estimates are made, and next to them comes a son of Rysdyk's Hambletonian in Jay Gould, followed closely by a representative of Canadian Chief, then Alexander's Norman, through Blackwood, four places below him being the first of the Mambrino Chiefs in Woodford Mambrino, so that in respect of the ability of daughters to produce speed, as judged by the records to the close of 1891, these strains of blood would stand in the following order:

Pilot Jr	2⅛
Clay	1 11-15
Hambletonian	1 8-13
Canadian Chief	1½
Alex. Norman	1 2-5
Mambrino Chief	1 7-17

Following Blackwood, it will be noted, come two representatives of the Hambletonian strain in Messenger Duroc and Alexander's Abdallah, sons of Rysdyk's Hambletonian, and Belmont, a grandson. Woodford Mambrino and his sire, Mambrino Chief, are split for the next two positions by Dictator, another son of Hambletonian. In this list of forty-seven stallions having ten or more producing daughters it is found that the Hambletonian blood is just as prominent proportionately as it is in other departments of speed production at the trot or pace, its representation being as follows:

Rysdyk's Hambletonian	1
Sons of Hambletonian	16
Grandsons of Hambletonian	4
Great grandsons of Hambletonian	1
Total	22

This is nearly half of all the stallions in the list, and it should be noticed that in making this calculation direct descent in the male line only has been observed. There are in the list eight representatives of the Mambrino Chief family—Woodford Mambrino, Mambrino Chief, Clark Chief, Mambrino Chief Jr., Mambrino Pilot, Mambrino Boy, Mambrino Patchen and Princeps—and the total number of trotters and pacers of standard speed produced by their daughters is 147. Taking an equal number of the Hambletonian horses which figure in this list and selecting the best eight of the entire representation we

Digitized by Google

find that their daughters have produced 241 trotters or pacers that have made themselves standard by performance, or nearly 100 more than the like number of mares of the Mambrino Chief family which figure in the list.

Notes and News.

THE MOHAWK FAMILY.—A correspondent of a California paper gives a very interesting account of the stallion Mohawk that was taken from New York to Ohio in 1860, and that, in addition to three representatives in the 2:30 list, also has four producing sons and one producing daughter, one of his sons being the sire of the trotter, Alfred S., that Orrin Hickok brought east a couple of seasons ago and sold to Mr. Bonner for about $7,000, after the horse had made a record of 2:16¼, and pulled a wagon over one of the Philadelphia tracks in close to that time. The day Alfred S. made his record of 2:16¼ in Chicago, in 1890, he trotted over the Washington Park track, which was like a billiard table, while the air was so still that the flag on the club house hung listless at the pole. The principal competitor of Alfred S. was McDoel, a prominent member of Budd Doble's stable, and generally considered to be capable of beating any horse in his class with considerable ease. A few weeks previous to the Chicago race Hickok had driven McDoel on one occasion when other engagements prevented Doble from doing so, and as the horse lost his race under Hickok's management, there was a good deal of criticism of the California driver, particularly among the class of men who can always sit in the grand stand and drive better races than anybody else can by climbing into the sulky and holding the reins in reality instead of imagination. The criticisms over the race in which he had driven McDoel nettled Hickok a good deal, and he confided to some of his friends during the Chicago meeting that when Alfred S. and McDoel came together it wouldn't be necessary for anybody to put the brakes on the last named horse in order for him to lose. Hickok made his words good when he started Alfred S. against McDoel at Chicago, by stepping off three heats in 2:17½, 2:16¼, 2:19. It was in the second heat that Doble made his grand drive with McDoel, starting in at the head of the stretch and keeping it up as long as his horse could stand the clip. Some idea of the rate of speed these trotters were going from the head of the stretch to the distance stand, at which point McDoel began to furl his sails, may be inferred from the fact that the official time of Alfred S. for the quarter was 31¾ seconds—a 2:07 gait—which was fast enough to make even a sprinter like McDoel dizzy when it came to going that sort of gait at the finish of a mile. It was this scorching quarter that enabled Alfred S. to win the third heat easily in 2:19, and from the way he performed on that occasion everybody who saw him admitted that when it came to racehorse qualities there was not a trotter in the country that could give any odds to Alfred S. When he subsequently went to Philadelphia and took a wagon record of 2:16¾, in an exhibition against time, he attracted the attention of Mr. Robert Bonner, who purchased him, and has since driven him on the road. Mohawk, the grandsire of Alfred S., is said to have been a grand looking horse when he came to Ohio twenty-two years ago this spring, and the man who wrote his history for the California paper says that a large crowd had assembled to see him, and when the car arrived it was found that the stallion could not be unloaded until the door and a part of the roof could be taken away, his neck being so long that the horse could not be gotten out of the car in the ordinary way. This was at Fredericktown, Knox county, Ohio, Mr. John W. Hall, of that place, having shipped a carload of horses to New York with the avowed intention of exchanging what the load brought for a trotting stallion, and Mohawk was his choice of many that he saw. Hall's Mohawk, a son of Mohawk, has a record of 2:26, and is represented in the 2:30 list by a number of sons and daughters, one of his best performers being Belle Ogle, 2:21½. Clark's Mohawk, another son of Old Mohawk, sired Yellow Dock, that took a record of 2:11 with running mate. Old Mohawk himself is described as a dark chestnut in color, three white ankles and star and snip. He stood sixteen hands high, weighed 1,250 pounds, and in his races after coming west, on more than one occasion trotted poor half-mile tracks in 2:32, being hitched to a sulky that weighed at least 125 pounds. In those days not much attention was paid to the breeding of horses, and considering his opportunities, Mohawk was certainly a great sire, as he has produced quite a family of trotters, and it is doubtful if any mare that would be standard under the present rules was bred to him. His son, Elmo, that got two trotters, Alfred S. and Overman, with records better than 2:20, and the pacer, L. C. Lee, 2:15, was out of a mare concerning whose

Digitized by Google

breeding nothing was known. Elmo was taken to California early in life, and in 1873 made a record of 2:27. He has seven trotters and pacers that are standard by performance, and his daughters have produced Lorena, 2:30, at two years of age, Wanda, 2:17¾, and Serena, 2:29½, the latter a daughter of Sidney, that can go a mile about ten seconds faster than her present mark.

MORE NOTABLE YOUNG SIRES.—A correspondent of the MONTHLY calls attention to the fact that among the news items in the May issue was one in which appeared a list of twenty-seven stallions that at ten years of age or under have sired one or more trotters, two years old or under, with records of 2:30 or better. In reference to this last our correspondent gives the following information, which is timely and valuable: "At least half a dozen others should be included in this list, among the ones omitted being Eagle Bird, who at nine years old had a performer called Monbars, who made a two-year-old record of 2:16½, being the fastest two-year-old ever credited to a horse ten years old or under. The complete list of additions furnished by our correspondent is as follows:

Name.	*Foaled.*	*Sired.*	*Record.*
Dr. Strong	1884	Gov. Strong (2 yrs.)	2:28½
Autograph	1883	Rapid Transit (2 yrs.)	2:30
Bermuda	1883	Bermuda Boy (2 yrs.)	2:29
Eagle Bird	1882	Monbars (2 yrs.)	2:16½
Mamb. Payne	1882	Effie Payne (2 yrs.)	2:30
Evermond	1881	Patsy Curtis (2 yrs. 1890)	2:29¼

THE directors of the Hawkhill Grounds, Edinburgh, Scotland, the headquarters of the recently formed Scottish Trotting Union, offered a handsome cup for the best trotting stallion, open to all comers, special attention being directed to their gait and to road purposes. The horses entered were Mr. Watson's (Glasgow), Lyle (American) and Woodford (American); Mr. Brown's (Aberdeen) Denmark Jr., ex-winner of Glasgow Roadster Stallion Premium; Mr. McKenzie's (Falkirk) Mambrino Boy (American); Mr. Kerr's (Portobello) Dr. Layton (American), and Mr. McConnell's (Wigtownshire) Half Moon (British bred). Each horse was thoroughly examined, walked and trotted at twelve miles an hour. After a rigid inspection the red ticket was awarded to Half Moon, the holder of the British stallion record, and whose great success on the track, both at London and Liverpool, must still be fresh in the memory of a large number of our readers. The loud cheers which greeted the winner showed how popular was the award, and on calls being given for a show, Half Moon gave a grand exhibition round the track, his great speed and wonderful all-round trotting action being admired by all.

WE understand that the Duke of Marlborough has now in his possession and for service this season at Blenheim two very high-class American trotters, Malta and Handsom Boy. These horses stand sixteen hands high, are perfectly quiet in harness, and have the very best of legs, feet and shoulders. Their action when traveling fifteen or sixteen miles an hour is everything that a fastidious Londoner could desire, and should they be used on good, strong, serviceable, but somewhat thick-shouldered, round-legged hackney mares, can not fail to make a strong impression. Being both up to 14 st., and their pedigrees containing so many absolutely thoroughbred crosses, there is every reason to suppose that if properly mated they might get valuable hunters.—*London Live Stock Journal.*

The Duke evidently means to introduce the "inducement plan" into Britain, patriotically with the intention of making his countrymen acquainted with the prepotence of the American trotter. He has placed the service fees at figures that none can grudge—3 gs. in the case of each.

WE have lately received an official and corrected summary of a race at Helena, Mont., which reduces the record of the bay mare, Lady Maxim from 2:27 to 2:26½.

Helena, Mont., August 29, 1889. Purse $500; 2:35 class.

Georgie Moshler, ch g, by Strathmore	2	1	1	2	4	1
Lady Maxim, b m, by Maxim	3	2	2	1	1	2

Time, 2:32—2:25½—2:25½—2:26¼—2:30—2:31½.

IT is estimated that in 1891 about 30,000 horses that had previously been used on street-car lines were thrown out of a job in that capacity by the employment of electricity for the work they had accomplished.

MR. C. J. HAMLIN, who was so unfortunate last year as to lose the grand young stallion, Prince Regent, 2:16½, met with another misfortune the early part of June in the death of the pacer Glendennis, directly following a race at Fleetwood Park, New York, in which the stallion made a record of 2:17¾. Glendennis, in addition to being a fast horse, was an excellently bred one, being a full brother to Justina, 2:20, both of them being by Hamlin's Almont, and out of a mare by Hamlin Patchen.

Digitized by Google

The supposition is that Glendennis was not in shape for the severe race he was forced to go at Fleetwood Park, as he was considerably distressed in the last two heats and died the same evening.

CHARLES MARVIN is quoted as having said that he expects to beat Bell Boy's three-year-old record of 2:19¼, with Belle Flower, a full sister to that horse, this season. Belle Flower last year showed the ability to go close to 2:20.

ANDY CUTTER, that made a record of 2:28 last season as a three-year-old, is stepping well over Crit Davis' track at Harrodsburg, Ky., having already moved a half in 1:10. He is by Cyclone, a stallion that had a record better than 2:25, and whose name was prominent last season by reason of the excellent campaigning qualities of his son Dr. Sparks.

A KANSAS CITY paper reports that Matt Colvin dropped dead in that city not long ago. "Old Matt" as he was universally known among the trotting-horse fraternity, was probably as vigorous a man of his years—eighty-two—as this country contained, and last fall the grasp of his hand was as hearty and his voice as strong as that of most men at fifty. Although to the present generation of race goers Matt Colvin's name was not a familiar one, he was, a quarter of a century ago, one of the best known drivers of trotters in the country, his stable at that time embracing among its members the famous stallion Pilot Temple, a son of Pilot Jr., and the dam of Flora Temple. He was a pretty fast horse for those days—considerably above the average in this respect as he made a record a trifle better than 2:25—and in addition to his speed he possessed the at the time desirable quality of being remarkably handy at going into a running break when hard pressed by a competitor and striking a trot again whenever his driver willed that he should do so and communicated the fact to him through the reins. For the last fifteen years or so Colvin has not been prominent on the turf, but although he had passed the allotted age of man he was as sprightly and chipper as a school boy and not less cheerful in temperament. Like most men who retain their vigor for an unusual length of time, Colvin was a total abstainer from liquor and tobacco and he had other qualities which made him friends and kept them close to him all his life. Although not a great reinsman he was above the average of drivers when in his prime, and now that he is gone his memory will always be a pleasant one to those that knew him in life.

THE stallion Bonnie Wilmore, that more than held his own in races where he took part last season, making a record a fraction of a second better than 2:15, is reported to be going well in his work, and it is also said that the weight on his forward feet has been reduced from twenty to ten ounces without affecting the horse's speed or way of going.

AMONG the deaths of trotters in June was that of the bay stallion Templeton, 2:25¼, by Warlock, dam by Happy Medium. He fell dead on the Belmont Park track in Philadelphia, June 1, while being worked out.

THE humane society very properly stopped an attempt to drive a horse thirty-six miles in three hours, at Bridgeport, Conn., lately.

ESTELLE, a daughter of Clark Chief, that was the dam of Erena, 2:23, and Rutledge, 2:27¼, died in Kentucky, May 29.

A performer whose work this season would have reflected credit on his sire, the Electioneer stallion Whips, has been denied that horse by the death at Terre Haute, the fore part of last month of the bay gelding Ariel, that Orrin Hickok brought with him from California, and that he had worked out three miles close to 2:20. Notwithstanding that his sire was from a thoroughbred dam, Ariel, although a horse of uncommon resolution was a very level-headed trotter as well as a fast one.

Now that there is so much talk concerning the breeding of the second dam of Arion, it is recalled that she was once traded for a cow, and that her full sister Manon, whose record is 2:21 changed hands in youth for $500.

MR. W. S. HOBART, a resident of San Francisco, who, during the last few years, has been prominent as purchaser of trotting-bred stock, died on June 2 after a brief illness, and as only a short time previous his wife had been taken from him by death, his immense property which has been inventoried in the probate court of San Francisco at $3,000,000, but which is said to amount to nearly twice that sum, goes to his children, two daughters aged respectively twenty-one and seventeen, and a son of nineteen. In addition to the ownership of the stallion, Stamboul, whose record of 2:11 makes him conspicuous among entire horses, Mr. Hobart purchased during the last four years what is perhaps the finest band of brood

Digitized by Google

mares in the country, such notables as Alma Mater, Trinket, 2:14, the dam of Nancy Hanks and many others of almost equal celebrity being among its numbers. The executors of Mr. Hobart's will are three in number, and they are given full power to manage the estate without bonds and to dispose of property without an order of court. As yet no definite information has been vouchsafed the public as to the disposition of Mr. Hobart's breeding farm near San Francisco, but the chances are that the animals will be disposed of in whatever manner seems best to the executors, and in view of the rich breeding of all the horses on the place, and the very creditable turf performances of many of them, the sale, if there should be one, will be an event of paramount interest to breeders.

MR. A. C. BRUCE, of Minneapolis, Minn., who owns the two-year-old colt, Axle, a son of Axtell, that has already shown a quarter in 34 seconds at Terre Haute, and a mile in 2:34½, recently purchased Axle's dam, a daughter of Adrian Wilkes, dam by Mambrino Patchen.

THE first mare to become a member of the great broodmare list this year is Minnie Drake, a daughter of Louis Napoleon, 207, she having produced Fred Drake, 2:26¾, and Ollie Drake, 2:25, the former having made himself standard by his performance at Los Angeles, Cal., in January last.

THE new rule of the National Trotting Association which provides that drivers can lay up only one heat in a race, and that they must give notice of such intended action on their part to the judges, was disregarded at the trotting meeting at Elmira, N. Y., not long ago, by Charles Forth and Jack Feek, each of whom was fined $25 for the act.

Two daughters of the well-known Indiana driver, Gee Grimes, are perhaps the most expert reinswomen of their age in the country. They are aged respectively sixteen and fourteen years, and at the recent meeting at Dayton, Ohio, they drove exhibition half miles with the pacers, Riley, 2:19¼, and Arch White, 2:19¾. Riley went the distance in 1:11 and Arch White in 1:12.

ARION is taking slow work at the farm of his owner, near Boston, his best mile thus far having been 2:40.

THE whole of the Jewett farm mile track will be under cover before next fall.

As showing what young trotters can win in this day of large stakes, it is stated that the Wedgewood filly, Wistful, started as a yearling in 1891 only twice, but carried home $3,500.

SAM ROBBINS, who drove Lady Mac five miles in thirteen minutes in 1874, beating the record at that distance, is still alive and hearty, being engaged just now in training a stable of trotters at Grand Rapids, Mich.

IT is said that one of the yearling trotters at Palo Alto recently stepped an eighth of a mile in seventeen seconds, which is a 2:16 gait. It begins to look as though the yearling record might be close to 2:20 when the present season closes, and if this is accomplished it will not create as much excitement as did the 2:29¾ mark of Freedom in 1890.

ELECTIONEER now has 102 standard performers to his credit; Paolo, a full brother to Palo Alto, and another trotter by Electioneer having recently entered the list in California.

THE sensation down East thus far this season in the way of yearling speed has been furnished by a pacer of that age called Carazo, he having gone a quarter not long ago in 2:35½ seconds after six weeks' handling. It is interesting to note that in the pedigree of this phenomenal young pacer trotting blood of the developed kind figures conspicuously. His sire was Alcantara, 2:23, grandsire George Wilkes, 2:22. The dam of Carazo is Jennie Cobb, 2:30½, she by Charles Caffrey, son of General Knox, 2:31½, and Rosalind, 2:21¾; second dam a sister to Maxie Cobb, 2:13¼, by Happy Medium, 2:32½.

AVENA, a daughter of Black's Hambletonian that has a record of 2:25½, recently went a mile at Lexington in 2:24½, the last half in 1:11, and from the way in which she finished it looked as though she could have knocked off at least a couple of seconds from the performance.

IT is understood that an arrangement will be made whereby Secretary Fasig, of the Cleveland trotting track, will retain his connection with that organization, although he is to be manager of the trotting department of Tattersall's. Mr. Fasig is as near a model trotting track secretary as they make them.

NOT long ago fire destroyed one of the training barns at the Woodburn farm of A. J. Alexander, sixteen horses being consumed, all of them trotting-bred. Fortunately none of the

Digitized by Google

great stallions or broodmares on the farm were among the lost, the sixteen being composed of three and four-year-olds. Among the best ones burned were Pastime, 2:27¼, by Lord Russell, dam Noonday, by St. Elmo; Petroline, bay filly (3), by Lord Russell, dam Petrol, by Onward; Radiant, bay filly (3), by Lord Russell, dam Rosabella, by Belmont; Engardine, bay gelding (3), by King Wilkes, dam Englewood, by Belmont; Fenina, bay filly (1), by King Wilkes, dam Puella, by Harold; Teneriffe, bay colt, by Stornaway, dam Tulip, by Alexander's Abdallah; Materia, bay mare (4), by Matterhorn, dam Dolly (dam of Belmont Jr. 2:28½), breeding unknown; Antigone, bay mare (4), by Harold, dam Minette, by Vakeel.

MESSRS. GERTON & HOYT, Cloverdale Stock Farm, Gloucester, N. J., lost by death on June 16 their valuable stallion Magnet Chief 18886. He was by Messenger Chief, dam Miss Heyden, by Mambrino Foster, by Mambrino Patchen; second dam by Ashland Chief, etc. He was in training and had shown a mile better than 2:25. He was valued at $6,000, and the cause of death was inflammation of the bowels.

THE trotting stallion Galvano 9135, b h foaled 1888; by Gambetta Wilkes 4659; dam Enterprise, by Onward; second dam Belle Thorn, by Hero of Thorndale, died May 25, 1892, the property of S. B. Hazard, Peoria, Ill. Galvano was a promising young sire, and his owner expects to put one or more of his progeny in the 2:30 list this season.

HUMPHREYS' Veterinary salesman crossed the continent to visit Palo Alto, the stock farm of Governor Stanford, the home of Sunol, Arion, Palo Alto, etc. After presenting proper credentials and exhibiting the list of prominent stock owners who are using the specifics, Mr. Reynolds, the superintendent, and Mr. Marvin, the trainer, consented to his treating Sunol and Palo Alto, as they were suffering from lameness. After thoroughly testing the specifics on these and other cases, Mr. Stanford's business manager and attorney, Mr. Lathrop, placed an order for Humphreys' Veterinary Specifics, probably the largest ever given for veterinary medicines alone. This completes the list of prominent stock owners who have adopted the use of Humphreys' Veterinary Specifics. Veterinary Manual mailed free on request. Address Humphreys' Medicine Company, corner William and John streets, New York.—*Adv.*

Questions and Replies.

G. W., LAKE PLACID, N. Y.—Is Golden Boy, pedigree given on enclosed card, standard and registered? If so, give breeding.

ANSWER.—Yes; No. 15621. Standard under Rule 6; ch h foaled 1886; by Champion Prince 10163; dam Lady Allen, 2:34½, by Phillip Allen, son of Black Hawk 5; second dam Elba, pedigree untraced.

C. I. M., MENOMINEE, MICH.—Give best record of bay or brown horse Joseph See, by Egmont.

ANSWER.—The best record we can find is 2:40½, at Coldwater, August 1, 1890.

H. G. W., BASKING RIDGE, N. J.—1. Please give pedigree on dam's side of Parson's Abdallah. 2. Pedigree of Lotta, dam of Bay Mate.

ANSWER.—1. The breeding of Parson's Abdallah on dam's side is untraced. 2. Lotta, by Parson's Abdallah, son of Abdallah 15; dam by Herr's Boston, son of Boston (thoroughbred).

P. B., LOUISVILLE, KY.—Is Black Bess, second dam of Mandarin 1720, the same mare as Black Bess, dam of Belmont Jr. 12626?

ANSWER.—No. The second dam of Mandarin is by Stockbridge Chief; the dam of Belmont Jr. is the dam of Darby, 2:16½, and by Coxe's Stump the Dealer.

SUBSCRIBER, ST. LOUIS, MO.—Please publish breeding of: 1, Christian's Edwin Forrest; 2, Barker's Edwin Forrest; 3, Berkeley's Edwin Forrest. Also give names of different owners so far as known.

ANSWER.—1. Nothing is known or recorded of the pedigree or history of Christian's Edwin Forrest. 2. Barker's Edwin Forrest, b h foaled 185–; by Edwin Forrest 49; dam Vic, by Price's Highlander; 2d dam said to be by Whip. Bred and owned by Robert Barker, Athens, Ky. 3. Berkeley's Edwin Forrest, — h foaled 185–; by Edwin Forrest 49; dam by Woodford, son of Koskiusko. Breeder and owners not recorded.

The Standard.

AS REVISED AND ADOPTED BY THE AMERICAN TROTTING REGISTER ASSOCIATION, APRIL 6, 1892.

THE TROTTING STANDARD.

In order to define what constitutes a standard-bred trotting horse, and to establish a BREED of trotters on a more intelligent basis, the following rules are adopted to control admission to registration. When an animal meets the requirements of admission and is

Digitized by Google

duly registered, it shall be accepted as a standard-bred trotting animal.

FIRST. Any Trotting Stallion that has a record of two minutes and thirty seconds (2:30), or better; provided any of his get has a record of 2:35 trotting, or better; or provided his sire or dam is already a standard trotting animal.

SECOND. Any mare or gelding that has a trotting record of 2:30, or better.

THIRD. Any horse that is the sire of two trotters with records of 2:30, or better.

FOURTH. Any horse that is the sire of one trotter with a record of 2:30, or better; provided he has either of the following additional qualifications: 1. A trotting record of 2:35, or better. 2. Is the sire of two other animals with trotting records of 2:35. 3. Has a sire or dam that is already a standard trotting animal.

FIFTH. Any mare that has produced a trotter with a record of 2:30.

SIXTH. The progeny of a standard trotting horse when out of a standard trotting mare.

SEVENTH. The female progeny of a standard trotting horse when out of a mare by a standard trotting horse.

EIGHTH. The female progeny of a standard trotting horse when out of a mare whose dam is a standard trotting mare.

NINTH. Any mare that has a trotting record of 2:35, or better, whose sire or dam is a standard trotting animal.

THE PACING STANDARD.

In order to define what constitutes a standard-bred pacing horse, and to establish a BREED of pacers on a more intelligent basis, the following rules are adopted to control admission to registration. When an animal meets the requirements of admission and is duly registered, it shall be accepted as a standard-bred pacing animal.

FIRST. Any Pacing Stallion that has a record of two minutes and twenty-five seconds (2:25), or better; provided any of his get has a record of 2:30 pacing, or better; or provided his sire or dam is already a standard pacing animal.

SECOND. Any mare or gelding that has a pacing record of 2:25, or better.

THIRD. Any horse that is the sire of two pacers with records of 2:25.

FOURTH. Any horse that is the sire of one pacer with a record of 2:25, or better, provided he has either of the following additional qualifications: 1. A pacing record of 2:30, or better. 2. Is the sire of two other animals with pacing records of 2:30. 3. Has a sire or dam that is already a standard pacing animal.

FIFTH. Any mare that has produced a pacer with a record of 2:25, or better.

SIXTH. The progeny of a standard pacing horse when out of a standard pacing mare.

SEVENTH. The female progeny of a standard pacing horse when out of a mare by a standard pacing horse.

EIGHTH. The female progeny of a standard pacing horse when out of a mare whose dam is a standard pacing mare.

NINTH. Any mare that has a pacing record of 2:30, or better, whose sire or dam is a standard pacing animal.

TENTH. The progeny of a standard trotting horse, out of a standard pacing mare, or of a standard pacing horse, out of a standard trotting mare.

TROTTING REGISTER.

STANDARD ANIMALS.

NOTE.—Copies of pedigrees in the Register will be reprinted here, at the option of the owner. The charge for publishing pedigrees here is one dollar each; to stockholders fifty cents. Insertion here is purely optional with owners. The advantages are two-fold: Immediate publicity is given and opportunity is furnished to all for criticism and correction. It is not only an effective and cheap advertisement, but it is *an official certificate of the registration and status of an animal*. The numbers of stallions are given (mares are not numbered), and at the end of the pedigree the volume of the Register in which it is recorded is denoted. As stated above, these are copies of registered pedigrees, and of course nothing is given here that is not already recorded in the Trotting Register.

ANNIE LOCKHEART, (7) b m foaled 1892; by Lockheart 6864; dam Victoria M., by Hampshire, 4242; g d Sis Ashton, by Hero. [See Victoria M., Vol. VIII.] Bred by F. A. Morrow, Onawa, Iowa. [Vol. XI.]

ATOSA, (6) b m foaled 1890; by Shadeland Onward 6010; dam *Lottie P.*, 2:17¼, by Blue Bull Jr. 2878. [See *Lottie P.*, Vol. X.] Bred by E. D. Gould, Fullerton, Neb. [Vol. XI.]

BEDOUIN 19739, (1) ro h foaled 1888; by Jay Bird 5060; dam Cinnamon, pedigree not traced. Bred by J. Malcolm Forbes, Boston, Mass. Record 2:28½. [Vol. XII.]

BELLE ACTON, (6) b m foaled 1891; by Shadeland Onward 6010; dam *Lottie P.*, 2:17¼, by Blue Bull Jr. 2878. [See *Lottie P.*, Vol. X.] Bred by E. D. Gould, Fullerton, Neb. [Vol. XI.]

BELLE OF CLARENCE, (5) b m foaled 1866; by St. Lawrence (Finch's); dam's pedigree not traced. Bred by Ira P. Collver; passed to W. D. G. Cottrell, Clarence, Iowa. Dam of Clarence Girl, 2:26¼, Edna W., 2:29, etc. [Vol. XI.]

BELLE OF NUTWOOD, (6) b m foaled 1892; by Electric Bell 10529; dam Sis Nutwood, by Nutwood 600; g d Pilot Lady, by Pilot Jr. 12, etc. [See Sis Nutwood, Vol. VII.] Bred by J. E. French, Cleveland, Ohio. [Vol. XII.]

BEONELL 19591, (6) b h foaled 1889; by Kentucky Prince 2470; dam Bessie (dam of Barrmore, 2:29¾), by Victor Bismarck 326; g d Flora, by Young Naugatuck, etc. [See Bessie.] Bred by John H. Baird, Bethel, Conn. [Vol. XII.]

BIDDY WILKES, (6) b m foaled 1891; by Harry Wilkes 1896; dam Kitty K., by Kearsarge 192; g d Bessie Morris, by Robert R. Morris 648, etc. [See Kitty K., Vol. XI.] Bred by Isaac Peabody, Frederickton, N. B., Can. [Vol. XII.]

IRDSON 18724, (6) ch h foaled 1891; by Bird McGregor 14410; dam Memphis, by Onward 1411; g d Nashville (dam of Trumpeter, 2:23½), by Woodford Mambrino 345, etc. [See Memphis, Vol. VI.] Bred by Harvey Brothers, Wilkes Barre, Pa.

ONNIE SAUM, (7) ch m foaled 18—; by Brougham 800; dam Lady Bashaw, by Bashaw Jr. 51. Bred by Joseph Saum, Norton, Kas.; passed to J. D. Case, Spring Green, Neb. [Vol. XII.]

ANNIE M., (6) b m foaled 1891; by Sulwood 6913; dam Deborah (dam of Storm, 2:27), by Squire Talmage 668; g d Belle Dewire, by Bonner, son of Major General Cadmus, etc. [See Deborah.] Bred by H. B. Kelley, Vinton, Iowa.

APTAIN KETCHUM 18505, (6) b h foaled 1887; by Canonicus 12847; dam Lady Ferguson, by Grey Eagle 898; g d Old Polly, by Belknap 60. [See Lady Ferguson.] Bred by B. J. & D. A. Moore, Dunlap, Iowa; passed to J. J. Torrey, Oakland, Neb.

ARROLL P. 20126, (6) b h foaled 1892; by Pleasanton 13662; dam Lois, by Mario 1359; g d Mag Worley, by Clark Chief 89, etc. [See Lois, Vol. VII.] Bred by F. S. Gorton, Chicago, Ill.; foaled the property of J. C. Mershon, Mount Carroll, Ill. [Vol. XII.]

CHARLEY WRIGHT 20106, (6) b h foaled 1892; by Barney Wilkes 7433; dam Silveredge, by Abdalbrino 2646; g d Silverhair, by Administrator, 357, etc. [See Silveredge, Vol. VII.] Bred by O. P. Alford, Lexington, Ky.; foaled the property of W. H. Randall, Durand, Ill. [Vol. XII.]

COCHIN 19744, (6) b h foaled 1888; by Connaught 2432; dam Ethel, by Messenger Duroc, 106; g d Coquette, by Wild Irishman, 252, etc. [See Ethel, Vol. V.] Bred by A. G. Strawbridge, Sharon, Pa.; passed to C. & R. A. Stratton & Co., Evansburg, Pa. [Vol. XI.]

COLONEL RICHARD 19623, (6) b h foaled 1889; by Strathmore 408; dam Torchy, by King Rene 1278; g d Rosewood, by Blackwood 74, etc. [See Torchy.] Bred by C. R. Durand, Jackson, Mich. [Vol. XI.]

DAISY DEWAR, (6) b m foaled 1891; by Wilkesbarre 5244; dam Nelly Dewar (dam of General Smith, 2:20), by Royal Revenge, 978. [See Nelly Dewar, Vol. XI.] Bred by Robert S. Smith, London, Ont., Can. [Vol. XII.]

DRETTA, (6) b m foaled 1891; by Allandorf 7462; dam Sentinella Wilkes, by George Wilkes 519; g d Sentinette, by Sentinel 280, etc. [See Sentinella Wilkes, Vol. VII.] Bred by W. C. France & Sons, Lexington, Ky.; passed to John A. Weindel, Jerseyville, Ill. [Vol. XII.]

EDWILL 20312, (6) b h foaled 1891; by Fayette Wilkes 2036; dam Manzana, by General Hancock 1165; g d Manzanita, by Mambrino Abdallah 2201, etc. [See Manzana.] Bred by Richard Eccles, Auburn, N. Y. [Vol. XII.]

EFFIE DEAN, (6) b m foaled 1891; by Shadeland Onward 6010; dam Niobrara, by Alvarado 2066; g d Idol Girl, by Commissioner 1046, etc. [See Niobrara, Vol. VII.] Bred by Gould & Miller, Fullerton, Neb. [Vol. XI.]

ESSIE WILKES, (7) b m foaled 1889; by Red Prince 7424; dam Maywood, by Blackwood Chief 7670. Bred by John McCabe; passed to Mrs. John McCabe, Peru, Ill. [Vol. XII.]

FIRST CHOICE 19603, (6) b h foaled 1892; by Guy Kohl, 10724; dam Choice Stamboul, by Stamboul 5101; g d Choice, by Dictator 113, etc. [See Choice Stamboul, Vol. VIII.] Bred by C. F. Clark, Boston, Mass. [Vol. XI.]

FLORA, (5) ch m foaled 1871; by Yankee Notion; dam Kate, pedigree not traced. Bred by Louie Richards, Northport, Wis.; passed, 1882, to S. Kelley, Royalton, Wis.; then to W. J. Leonard, Stevens' Point, Wis. Dam of Alar Clay Jr., 2:29½. [Vol. XII.]

FLORIDA, (2) bl m foaled 1887; by *Montana Wilkes*, 14208; dam Allerta, by Dalgamo, 13047; g d Tweedledum, by Lexington Golddust, 4205; g g d Mary Tweedledum, by Woodford Mambrino, 345, etc. [See Mary Tweedledum, Vol. VII.] Bred by Noah Armstrong, Twin Bridges, Mont.; passed to Breck & Long; then to H. Barbour, Helena, Mont. Record 2:21½. [Vol. XII.]

FLORINE, (7) ch m foaled 1887; by Brougham, 800; dam Lady Bashaw, by Bashaw Jr. 51. Bred by W. D. G. Cottrell, Clarence, Iowa. [Vol. XII.]

FORCHY, (7) b m foaled 1885; by King Rene 1278; dam Rosewood, by Blackwood 74;

WALLACE'S MONTHLY.

VOL. XVIII. AUGUST, 1892. No. 6.

Entered according to Act of Congress, in the year 1891, by AMERICAN TROTTING REGISTER ASSOCIATION, at Washington, D. C.

TERMS: TWO DOLLARS PER ANNUM. SINGLE NUMBER, TWENTY CENTS.

AXTELL AT WORK.

BY S. T. H.

Among Some of the Great Campaigners at Terre Haute.

THE beautiful trotting park at Terre Haute is the most picturesque in the morning twilight of early June. It nestles in the bosom of the vast amphitheatre, surrounded by the extended range of hills, whose fringes of primeval forest give to the distant background the hazy charms of landscape effects.

The course is a rectangle, with the four corners reduced to a curve. The inner half mile course for colts and unbroken horses is regulation in shape.

The sub-stratum of both is sand, but the surface is artificial, formed by a layer of tenacious yellow clay twelve inches in depth. This is one of the more recent track improvements. Neither black, alluvial soil, nor leaf mould from vegetable decay, forms the tough, expansive surface necessary for the best trotting course. To the texture of the clay surface, and the thoroughness of its manipulation, much more than to the shape and grades, is attributable the wonderful speed records that have made the Terre Haute track famous for its great race meetings, as well as one of the most desirable training grounds of the more proficient trainers. The grades are as peculiar as the general shape. From the grand stand there is a slight rise, followed by a gradual depression, reaching to the quarter pole; then the surface rises to the half mile, and from that point gently declines to the turn leading into the short-home stretch, where its grade rises perceptibly to the wire. The turns are thrown up one-half an inch to the foot, but they are broad, reaching the expanse of eighty feet, while the stretches and upper sections are narrowed to seventy feet in width.

The course is kept in the most admirable condition. Notwithstanding the recent heavy rains, the hot sun of June had a tendency to bake the surface. From dusk to twilight, on the morning of the trials we were invited to witness, the sprinkler was industriously employed, and when the morning sun came down, fierce and drying, the coarse, heavy harrow, followed by a lighter, finer one, pulverized the surface till it was smooth and fast, yet neither hard nor deep.

The seventy-five acres within the park enclosure, outside of the course, are adorned with groves of oak and beach and poplar trees, treasured monarchs of the pristine forest, under the cool shade of whose extended branches are grouped the long rows of gleaming white, commodious stables, containing, in all, two hundred and fifty box stalls. Within their clean, well ventilated quarters, are collected some of the greatest campaigners, and many of the most promising candidates for honors on the trotting turf. Indeed, if all other trotting horses in this country were suddenly obliterated, there are enough here collected to form a nucleus, which would sooner crystallize the American trotter into a type of extreme speed and distinctive formation, and of clearly defined, well balanced mental traits, than will be produced on this continent by the widely miscellaneous methods that have recently obtained. Here are collected some of the best daughters of the Guy Wilkes and the Electioneer, and the Mambrino Patchen,

Digitized by Google

and the Sultan families. To preside over them, with the majesty of his overpowering individuality, is the superb Axtell, mightiest in his day and class upon the turf, with the more brilliant promise, like his grandsire, George Wilkes, of becoming mightier still in the harem. If there is such a consummation as the perfection of gait and the ultimation of speed, it should come from the crossing of Axtell with these two demonstrated, most successful branches of the great Hambletonian families, the Electioneers and the Guy Wilkes, having for reinforcement the American Star and the Mambrino Patchen and the Clay outcrosses. For he would measurably widen the close movement of the Electioneer branch without necessarily compelling the produce to forsake that most desirable, because speediest of all movements, the straight-line action of Sunol and Palo Alto. He would just as sensibly lengthen the short, trappy action of the produce of Guy Wilkes, while the triple combination of Hambletonian blood through the Axtell, Electioneer and Guy Wilkes lines would intensify the speed resolution, the speed formation and the speed action that so marvellously characterize each one when considered seriatum.

But before dwelling, *con amore*, upon the equine magnates at the park, in critical detail, it is opportune to note the group of celebrated trainers, sitting in a circle at Doble's headquarters, talking animatedly of past battles, and, in moments of absent mindedness, dreaming with the far away look of reflective seriousness of the impending contests that within a few days will begin, to continue until the first light rifts of snow from the north will prove too soon for them to be the harbingers of the approaching winter. Doble and Goldsmith and Hickok and Dickerson form an object group of interesting study. The appearance of trotting horse trainers has improved with the vastly increased importance of the profession. No judge of human nature would associate these men, in manners and conversation, with the trotting horse jockeys of the olden time. Their dress was not only negligée, but shabby. Their lips were discolored with tobacco. Their faces flamed with the angry fires of consuming liquors, and their tongues should have been blistered by the incessant torrents of blasphemies, which they constantly employed as the substitute for both words and ideas. Be it said, to the honor of the modern trotting turf, that this race of trainers has passed away forever. The group we are sketching are not only neat, but natty in appearance, more than one of them approaching to the costume of the seaside exquisite, in personnel. Dickerson, unusually quiet, from the feeling that he is the junior in this council of generals, in repose, often brings into play his habitually business-like smile, his features, more than his words, showing his approbation or dissent from the passing expression of opinion. Hickok is always reflective in manner. His clean cut features and thoughtful expression of countenance betoken the clearness and capacity of his mental faculties. His cold, gray, penetrating eyes glisten like the points of gleaming bayonets. His well considered assertions come from his tightly compressed lips with a precision and completeness that indicate cautious deliberation as the dominant frame of his mind. For profound strategy and secrecy of plans, his facial expression declares him to be the Machievelli of the trotting turf.

Beside him sits the more genial and more freely communicative John Goldsmith, the last remaining representative of that race of great harness horsemen, the Goldsmith family of New York state. About the same in hight as Hickok and Doble—neither more than five feet seven inches in stature, Goldsmith is fairer in complexion, fuller in the face and form, and more sanguine in temperament at least than Hickok. He sits between Doble and Hickok, and, dividing these nestors, he looks more than even Dickerson like a promising youth. But even when his features are at rest, there is a quiet determination in his expression, and a forceful gleam in his eye, that betoken both his heroic courage to win his races, in desperate finishes, and his quick perception of advantages as they arise, during a race, that has always marked his brilliant turf career. But the conceded oracle of the group is the

Digitized by Google

Chesterfield of the trotting turf, Mr. Budd Doble. The Sultan of Turkey never travels toward the setting sun with a more complete retinue of royalty than does this prince of trainers move down the grand circuit to certain victory. Even the beards of his well winnowed oats are clipped, lest they roughen the delicate throats of his superb trotting champions. His stalls are sealed and trimmed to a neatness suitable for a lady's boudoir in her fashionable outings. His blankets and coolers and sheets, of the latest patterns and costliest materials, are as gorgeous in hues as the colors of tropical rainbows in sunset showers. Weight and friction in the minutest detail has been reduced to the minimum. The harness, with trees and trimmings of aluminium, weigh only five pounds. The sulkies of the great campaigners weigh forty pounds, sixteen ounces less than that of Maud S. Indeed all of his sulkyettes and sulkies and training carts, delicately fashioned, yet strong as mechanical ingenuity can make them, revolve upon noiseless spindles. His boots and mechanical appliances, ample in design and effective in use, are kept as clean and ready for service as his own driving costume. His employees are seemingly extravagant in number and remarkably proficient in their specialties. His private clerk is an educated gentleman, competent and efficient in presiding over the accounts and correspondence of his employer. His veterinary surgeon is quick to detect the slightest symptoms of ailment in any of the valuable horses in his charge, and while superintending their cooling out, with rubbing rag in hand, as an extended fan, he frequently waves refreshing drafts of air into the expanded nostrils of the horses, after Mr. Doble has given them severe trials and severer repeats. His farrier, a Swede by birth, has profound mechanical insight, and, tutored by the exceedingly ingenious experimental wisdom of his employer, he can forge shoes so delicate and intricate in design, that if it were possible to swedge out a watch on the anvil, this master mechanic could accomplish the work. His rubbers are like automatic machines in their active precision. Not a word is spoken when their master gracefully dismounts from the sulky. The routine is the same, whether it be some unknown colt, or great turf winners, like the gallant Jack, or the weaving Nancy Hanks, who jogs in a pace, and speeds with a peculiar winding swing, that gives her all the restful help of the pace, yet preserves, at the same time, the well defined action of the trot. They quickly remove the harness, placing the heated horse out of the reach of all drafts and cross currents of air; they lightly scrape away the free perspiration, and rapidly absorb with clean cloths, lightly applied, nearly all that remains. They dexterously bathe the carcass with a gentle tonic stimulant, and the limbs with a stronger liniment. They compress the extremities from the knees and hocks to the pasterns with damp closely woven bandages; neatly overcapping them with scientific celerity worthy of the internes of the Paris hospitals. They then straighten out the hair with dry cloths, white as snow in their dainty cleanness, and lead the panting horse out to occasionally graze and gradually cool out under the ample folds of a thin blanket, whose texture is close enough to prevent cold draughts of air from entering the pores, that are gaping wide open, like millions of thirsty mouths, ready recepticles, when not thus guarded, of fatal congestion. They know when the walking exercise should cease; when the tight damp bandages should be removed, and dry loose substitutes replace them; when the body and limbs should be finally brushed and cleaned, and when the horse, thus put through a course of judicious jogging and speeding and care-taking, more complete than the training of an athlete, or the thorough massage treatment of a patient in the Russian baths at St. Petersburg, should be fed and clothed for his night's rest. All this is done, under the supervision of the veterinary surgeon, with a completeness and despatch, all the more remarkable, that a single word is scarcely ever spoken from the beginning to the end of this patient preparation for the great races, which the genius of the master reinsman, Doble, has won with more horses that he has made kings and queens of the trotting turf in actual

Digitized by Google

races than any other trotting turf celebrity in trotting history.

The quartette forming this group of great trainers are profoundly wise in their profession. No commanding general upon the field of battle more successfully marshals his forces in great emergencies than do these famous drivers concentrate all the energies of themselves and of their horses to win brilliant turf victories.

In their worldly-wise faces can be plainly read self-dependence. Naturally keen witted the precarious life upon the turf has made their minds quick as instantaneous cameras to receive passing impressions. The successful preparation and management of their horses in races, and the measurement of their own abilities with each other in desperate contests, have given to their features and presence that penetrating, worldly-wise expression which the casual reader of character can detect in the glint of their eyes. Inexperienced observers on the race courses, when they see these master reinsman contending most fiercely against each other in hard-fought turf battles sometimes indulging, *sotto voce*, in personal vituperation between heats, would conclude that they must cherish lifelong ill-feelings against each other, even if it does not manifest itself in positive enmity. But this is a mere delusion. Like a company of earnest lawyers, who have recently been at swords' points in some legal controversy, after the battle of words they are the personification of genial companionship and professional courtesy. They talk over their encounters and victories and defeats with the humor of after-dinner speakers, and assist each other in their daily training with a fraternal consideration that amazes the old-time jockey. For instance, Hickok kindly volunteered to drive his three-quarter bred Whips gelding, that recently came from the drudgery of the plow at Palo Alto, against the promising Jersey Wilkes filly, Chiquerita. Moving around the course, like a double team without break or mistake throughout the mile, they finished the last quarter in thirty-five seconds of a fast dead heat. Goldsmith frequently accompanies Doble when he is giving Jack or Nancy Hanks a trial with Hazel Wilkes and the best of the Corbitt campaigners. But they watch each other's performers with intense interest. Both before and after every trial they know precisely the condition of each other's horses, and speculate upon their capacity for the great impending engagements with a maturity of judgment and accuracy of knowledge that make the most brilliant moves upon the chessboard mere bagatelles of intellectual acumen in comparison. Another feature of their methods of training in which they all agree is the slow, systematic preparation of their horses for the season's races. They all antagonize the short, rapid brushes of the Palo Alto system of training. Young colts, they admit, should receive this treatment, for they rarely can withstand the rigor of severe training. But the horse designed for even a severe repeat race, and much more for an arduous campaign, should have an abundance of slow miles, ranging from three minutes to those trotted in the forties, even though he is capable of trotting in the twenties. Repeats are judiciously given, all within his capacity, and the measure of his speed is tested by his ability to trot fast the finishing quarter. This patient process of development by which every muscle of locomotion is thoroughly seasoned, and the entire organism, including the brain, muscles, heart, lungs, digestive organs, limbs and feet, is slowly but surely brought up to the very perfection of condition. This is the perfected result of more than fifty years of empiricism. This preparation alone makes speed, staying qualities, and gameness combined, in severely contested races. The brush method, they maintain, equips the mile dash phenomenon, but ruins his chances in repeat contests. To this careful, patient, gradual process of conditioning and speeding trotting-horses, especially within the past decade, as much as to the improvements in harness, and sulkies, and race-courses, is to be largely attributed the grand broken heat performances on the trotting turf. For, undoubtedly, the horse thus conditioned not only continues to improve as the season advances, but his speed is so gradually developed that with good

Digitized by Google

breeding he rarely ever becomes stale or disgusted with the race-course. These careful methods are among the great triumphs of the modern trainer's art. They have been tested by judicious experiment until they have become as well settled in horse lore as the common law in jurisprudence.

Mr. Hickok, like Senator Stanford and Saulsbury and Brodhead and Goldsmith, is a firm believer in the thoroughbred dam to insure gameness in the trotting campaigner. He confidently hoped to prove his position with Ariel, but the trip across the continent fastened upon the lungs of the gelding relentless pneumonia, and he died within a few days after he reached Terre Haute. But he is not altogether without hope, now that he has to rely solely this season for demonstration upon the large untrained Whips gelding in his stable. The Jersey Wilkes stallion Hussar, record 2:20½, is moving with great steadiness and resolution under his tutelage, and, beyond a peradventure, he will materially lower his record. In connection with his training Mr. Hickok shrewdly remarked: "Hussar needs plenty of flesh. If the "weather continues as warm as it is here "to-day, I will have to ship to a cooler "location, for I do not wish his flesh to "slip from him." Only the expert trainer thus learns the niceties of conditioning, as regulated by the constitutional requirements of each horse. Perhaps the most formidable stable of trotting horses, from two-year-olds to aged campaigners ever brought across the mountains from the Golden state, is that of Mr. John Goldsmith. They consist of the get of Guy Wilkes and of his son Sable Wilkes. They are in superb condition. The climate of California admits of working the trotter so early in the season, that. notwithstanding the long journey, he is much more seasoned than the trotting-horse of the east. Those that have been worked the longest have withstood the journey with the least exhaustion, and that seems to be the general result. At the head of this splendid stable is ranked Hazel Wilkes.

Five of the produce of Guy Wilkes have better trotting records than Hazel Wilkes, but since her arrival in her morning exercise she trotted a quarter in thirty-one and three-quarter seconds, and has both the strength and courage to maintain an exceedingly high rate of speed. She is a low-set chestnut mare with a blazed face, decidedly heavy bodied, on short legs. But the foreshortening of the limbs is confined to the cannon bones, for the forearms are both long and broad in muscular equipment, The merit of her trotting capacity can be measured by the weight of her shoes, which are each seven ounces in front and four ounces behind. In her class she will prove a successful performer. Her brown-coated sister, Una Wilkes resembles her in contour, with possibly less breadth and power, but she has quite as much speed, and the breeding of the dam being by Arthurton out of Nancy, by Gen. Taylor, indicates that staying capacity for which these mares have already earned an enviable reputation. Great speed and greater expectations are centered in the performers by Guy Wilkes out of daughters of Nutwood. The only representative of this stout breeding in the present stable is Vida Wilkes, out of Vixen, by Nutwood, grandam Sister (dam of Albert W., 2:20), by John Nelson. Her three-year-old record of 2:18¼ in shoes weighing only eight ounces in front and four ounces behind is not the extent of her speed in her four-year-old form.

Among the younger lot is the noble filly Muta Wilkes, by Guy Wilkes, out of Montrose, by Sultan. She trotted a trial mile, well within her speed, in 2:26 and has shown quarters worthy of Nancy Hanks. Ora Wilkes a rather undersized but very strong black colt, is a candidate for the great two-year-old stake prizes, and to prove his claims, he trotted a half mile without any persuasion in one minute eleven and a half seconds, while the breeding of his dam, Ellen Mayo, by Director, is sufficient guaranty of his capacity to repeat.

Sable Wilkes has a remarkable representation in this lot of horses, which in appearance is the most striking in formation and speed trials and record performances ever brought from California. The critical horsemen from the Golden Gate look with much skepticism upon the progeny of Sable Wilkes. They all

Digitized by Google

center their doubts upon the Gretchen blood in his pedigree. His dam was Sable, by The Moor, and his grandam Gretchen (the dam of Romero, 2:19½), by Mambrino Pilot out of Kitty Kirkman, by Canada Chief. If Kitty Kirkman had been the daughter of a thoroughbred horse, instead of a cold-blooded sire, there would be no misgivings, but it is claimed that the iceberg stains in Gretchen have not only chilled the ardor of Sable Wilkes, but cooled the ambition of his produce. If such is the fact, it only proves the wisdom of Governor Stanford, who affirms that he is industriously engaged in eliminating every trace of cold blood in the broodmares of Palo Alto. But these evil prophecies may meet the same fate as the similar ones showered upon Volunteer in earlier times, when the turf solons proclaimed his produce would prove faint-hearted because his dam, Lady Patriot, was an alleged defaulter, as to courage. Sabledale, a stout black colt by Sable Wilkes, out of a daughter of Nutwood, has already shown a mile in 2:26½, trotting the third and fourth quarters faster than the others, and he is only two years old, with eight ounces on each front foot, and four ounces on the hind ones. If ease and grace of motion are criterions of repeating capacity, Sabledale will carry home to his hopeful owner, some of the rich stakes for which he is entered. But he alone is not with the stable to float the banner of Sable Wilkes. Macleay out of Mamie Comet, record 2:23¼, by Nutwood, grandam Black Betty, by Sportsman, is the black three-year-old colt that last year made a two-year-old record of 2:22¼, and he has increased his speed thus early in the season. If the Gretchen blood be base treason to endurance, it is exceedingly questionable whether it can have any material influence upon the overlapping stout crosses in the pedigree of Macleay.

Stronger, still, is the lineage of the bay three-year-old filly, Sabina, whose record of 2:27½ was made in her two-year-old form. Her dam is Eva, by Le Grand; grandam Eve, by Arthurton. When it is remembered that Le Grand was sired by Almont, dam the famous Jessie Pepper (the dam of Iona, 2:17½, and Alpha, 2:23½), by Mambrino Chief, and his grandam was by Sidi Hamet, what possible power the Gretchen blood, even if it is as heavy as the waters of the Dead sea, can have to contaminate such a reinforcement of pure and stout trotting and thoroughbred blood it is difficult to determine. To round up this galaxy of splendid performers, Guy Wilkes sends along the brave brown stallion, Rupee, out of Sable Hayward, by Poscora Hayward, whose pacing record last year in his four-year-old form of 2:14¾, indicates that the company of Hal Pointer and Direct may be increased to a trinity before the season closes. All the appointments of this stable are complete. The owner has shipped with his horses his own feed. The well winnowed oats are all the way from Oregon, which are claimed to be larger and more nutritious than can be raised elsewhere in America. No horseman can pass in review this splendid string of California trotters without bestowing a mental encomium upon the enterprise and intelligence of their breeder, Mr. William Corbitt, of San Mateo, Cal., and an outspoken commendation upon their conditioner and trainer, Mr. John Goldsmith.

The stables of Mr. Budd Doble are overflowing with great trotters. Prominent among the younger ones is Tony V., the promising two-year-old colt of Mr. Alley A. Bonner, who recently showed a quarter in thirty-five seconds, without his hopples, and Belle Vara, whose yearling race record is 2:38, whose three-year-old record is 2:22¼, and whose speed this season is simply wonderful. These baby trotters are both by Vatican, the promising son of Belmont, out of Vara, by Hambletonian; grandam Venus, by American Star.

McDoel, honest, reliable and brave throughout his career till faint-hearted misfortune overtook him last year, has been doing miles upon miles of medium speed, and he shows every indication of redeeming the mistakes of the past season.

The gallant grey gelding, Jack, moves with all the courage and style of former years, and if there is a class made for him at the great meetings he will capture the first premiums of these specials. Nancy Hanks, trim, fleet, delicate and

Digitized by Google

full of spirit, snapped with her teeth and flashed fire from her eyes when, after her best mile this spring, in 2:18, she was brought to her quarters for cooling out. This year her front feet are armed with two-ounce toe weights, but her stride and speed will place the championship of Sunol, before the season is over, in great danger.

But, incomparably above them all, in the writer's judgment, both in quality and formation, stands the superb Axtell. At rest he is the balanced perfection of animated mechanism. Tested by the measurements of La Place for the model horse, or by the tape-line requirements of Helm, for the perfect trotting organization, Axtell would more than satisfy the full complements of their exacting demands. In size and power and finish and speed conformation there is nothing more that could be required. He is a rich mahogany bay, with a delicate star and a dainty penciling of white down the center line of the nose. He stands fifteen hands three inches and a half high at the withers, and not a quarter of an inch less over the coupling. His proportions, in every aspect, harmonize with these measurements.

In profile, notwithstanding his apparent compactness, he displays great length in his entire conformation. His shoulders are deep, with the true inclination of the blades for trotting speed. Neither the extreme obliquity of the running horse nor the upright position of the coach-horse, but inclined enough to permit of extension of stride, forehanded, without that undue reach which exhausts the muscular capacity by its enormous revolution. His carcass is long, but lengthy as it seems in profile, it is fortified by strength at every point of its elongation. The saddle-place is short and stout; the ribs are strong and full of resisting capacity; the spinal column is powerful and bountifully supplied over the coupling with great fillets of overlapping muscles; the hips are long and broad, rounding up with great propelling capacity; the thighs and gaskins reach down, full and long, to the extremely low-set hocks, which, too, are remarkably powerful; the cannon bones are flat, short and broad, terminating in clean, strong ankles, that play upon neatly oblique pasterns and have for their base of support full, round feet of dark steel texture; the forearms are equally long and muscular, while the cannon bones are short and flat; the elbows stand out in bold relief from the body, pointing neither outwardly nor inwardly, but straight forward, while the hocks observe the same straight line position, insuring that most desirable of all articulations—line trotting—which now marks the movements of all the exemplars of extreme trotting speed. Viewed in front, Axtell's facial amplitude indicates a large volume of brain, balanced by judicious development. For his inches, he will measure greater between the eyes, with a larger brain pan above them, than can be found in ten thousand larger horses noted for their pronounced intelligence. His clear, brown eyes and their mild expression give confirmation to this impression, even if his remarkable reliability on the race course had not completely demonstrated this distinguishing element in his mental composition.

That preponderance of sense, which eliminates flightiness, shying and timidity in himself, which dominates the mental habits of his offspring, no matter how great may be the nervous excitability of their dams, is the superlative necessity in a sire even when physical conformation and great speed are insured. Axtell possesses this gift in an eminent degree. He is a remarkably sensible horse; sensible in his princely quarters, sensible when being harnessed for a race, calm and self-reliant on the score, being entirely free from that tremulous nervousness that excites sympathy for many noted campaigners less firmly equipped and entirely composed after what would prove exhaustive heats to many great performers. That Axtell contributes this capacity of self-reliance and self-control to his offspring the observing horseman needs only to watch his two-year-old son Axle in his stall, in his work, in his walking exercise, and when superheated by the exacting excitement of his great trials. They both remind one of the *sang froid* of that peerless race horse, Herzog, who, calm and determined, beat

Digitized by Google

the more fretful but the hitherto invincible Versailles in their memorable race, even while suffering from the acute pneumonia that ended his life within twenty-four hours after his great victory. Nothing frightens, nothing excites, nothing daunts the spirits of Axtell. The sire of the two-minute trotter must possess this splendid equilibrium of physical courage and brain capacity.

When you stand behind Axtell your admiration involuntarily frames the expression, "How beautifully he is molded! The hips are exceedingly broad, being almost abnormally rounded up with the wealth of massive leverage muscles; and when he raises his full, sweeping tail, the inside of the hams seem to be as richly endowed with propelling muscles as the outside. His hind quarters are thus literally all powerful. Not like the heavy inertia of the draft horse, nor the short-bowed capacity of the quarter horse, but long as well as broad; extended as well as full, so that the propelling power impresses the the student of horse anatomy as the very perfection of strong and rapid leverage in length as well as capacity for sustained repetition. Then the back seems to be so exactly conformable to the requirements of symmetry and power. After the eye passes over the well-formed dock and coupling, it perceives there is just enough curve, anterior to the coupling, for the graceful and beautiful outline, till the spinal column rises to the apex of the highly-formed withers; and the neck sweeps, with a graceful crest, up to to the sprightly, clean-cut ears, that are rendered more delicate and tapering in contrast with the great, broad jowl plates, and the clean, well-defined throat latch.

To all of this beauty and power, well placed, add the correct position of his limbs and feet. The stifles and hocks, the forearms, and ankles point neither outwardly nor inwardly, but straight forward, so that there is no lost motion, either laterally or longitudinally. When Axtell is in full motion then the supreme value of this perfection of brain and body and limbs is beautifully exemplified. He neither sprauls nor straddles in his gait. The limbs and feet move in harmony, well up under the carcass. The knees roll so that the hind levers can work up comfortably under the elevation of the front feet. The combined articulation is a beautiful revolution, always well up under the body, never too high too indicate lost motion in altitude, nor too wide to unnecessarily diverge from the straight line.

In the rapid improvement of trotting speed, the economy of action has proven to be the most potent factor. When the trotting horse was an elongated dweller, or a high-stepping, altitude mover, or a wide-actioned, cowhocked straddler, he lost as much muscular power as he used in his propulsion. But when all this vital force was enconomized, and utilized, then the 2:30 trotter dropped far below two minutes and twenty seconds. Sunol and Palo Alto, and Nancy Hanks, and Arion, and all the great performers thus trot within themselves. That this muscular and vital economy means better rating, or a more admirably preserved extreme speed, one need only to see Axtell in full motion to be thoroughly convinced. The long-gaited performers of the olden times could trot very fast quarters, while their rating was often sadly at fault. The terms duffers and quittors were then common horse parlance. But the modern trotter so carefully husbands his stride that sustained speed is no longer so utterly exhaustive. Hence there is less occasion for the terms quittor and duffer than formerly. Possibly the best example among entire horses that the trotting turf affords of this vital truth is that of Axtell. Throughout all of his races and exhibitions, in his two and three-year-old forms, he could come and come again, improving as he repeated, and finishing with a power that amazed even the most enthusiastic colt developers.

When his fortunate breeder, Mr. C. W. Williams, drove him to the stallion record of 2:12 in his three-year-old form, he did not seem to urge him throughout the mile. He sat erect, with the reins in his left hand, and the whip rigidly upright in his right. His position was never changed for the first half mile. The horse literally moved along on his own courage, the first quarter in

Digitized by Google

thirty-three seconds, and the second in one-half second better time. The famous driver of Direct accompanied him behind a harnessed runner. At the half-mile pole Starr noticed Williams almost unconcernedly wave the upright whip in the air, as the stock rested upon his knee. Instantly Axtell quickened his pace, leaving the runner struggling in the rear. On he went gaining at every stride. Starr affirms that he never saw a trotting horse forge ahead with such a rush of speed. He called to Williams to slow up around the turn, for his horse could not possibly carry that rate of speed. He then perceptibly pulled him back. Still the quarter was trotted in thirty-two and a quarter seconds. When the mile was finished in 2:12 there was no struggling, no weaving, no evidence of exhaustion, but the same well-sustained stride and quiet resolution that marked all of the courageous finishes of the wonderful three-year-old colt, Axtell.

This perfection of trotting-horse form and action, and courage and speed, is largely the triumph of scientific breeding. There are many sires, possibly more strikingly handsome than Axtell, like the superb Mambrino King, but without his muscular power and balance. On the contrary, there are some few sires like Red Wilkes, that have the power of Axtell without his finish and beautiful contour. Again there are still less that approximate to him in strength well placed, and in comliness, that have not the perfection, of his action. But there are none within the purview of the writer's observation, that have his combination of size, color, power, conformation, brain, action and speed, in the same degree of harmonious perfection, as they are thus perfectly united in the personality of Axtell. This perfection is not fortuitous. If only one, or even the majority of these qualities obtained in a trotting horse, he might still be the creature of accident. But the combination of them all points inevitably to scientific breeding. His grandsire produced many remarkable sires, all potent in the transmission of speed, but the character of the movement has been so materially modified, undoubtedly by the influence of the dams, that the original hind leg, duck-like action has not only been completely obliterated in many instances, but the extended forward stride has been materially modified. To the influence of the dam or grandam, sometimes so subtle as to escape analysis possibly by reason of the power of atavism, must this change be attributed. Thus the action of Baron Wilkes and of his produce differs as much from the movement of Wilton and his offspring as the gait of Guy Wilkes and his representatives varies from that of Axtell, and his baby sons and daughters that are just beginning to attract the thoughtful attention of the most ambitious breeders. Very frequently the remote crosses come powerfully to the surface in ther potent influence upon either the action or the disposition, or the formation, as well as upon the size and style that require an intimate knowledge of the ancestors to be difinitely traced. But nothing more forcibly commends itself to the analytical student of the breeding problem than the tracing of peculiarities of formation and action, and temperament of strongly marked representative sires through the maternal lines.

Such is the subtle power of this sometimes remote influence that the patient investigation from the several owners as well as from the data annually compiled in the invaluable Year Books, will in the extended future furnish to the science of biology some of its most remarkable deductions.

The influence of the sire is immediate and positive. That of the dam is generally more occult. Take for instance Maud S. The Hambletonian advocates claim her to be distinctively Hambletonian in form and action, while the Pilot adherents assert the favors the black Canadian pacer more than the Messenger lineage in her positive characteristics, and the thoroughbred enthusiasts affirm the general finish, and great courage, and speed ambition have come through the royal grandam, the daughter of the incomparable Lexington. The fact is she is plainly a combination of all three inheritances. The powerful leverage of the hind propellors

Digitized by Google

is clearly Hambletonian. Her sire, Harold, has this pronounced hind power and action. Her high, bold knee action, requiring for balance and extension, is essentially of the Pilot Jr. inheritance, while the capacity for extreme speed must be attributed to the Lexington foundation. These influences can thus be analyzed in other great performers. Take for another instance Guy Wilkes and Axtell. The former is by George Wilkes, out of a daughter of Mambrino Patchen, grandam by American Star. The latter is by William L., full brother to Guy Wilkes, dam Lou, by Mambrino Boy, 2:26½, son of Mambrino Patchen. Thus the blood lines are exceedingly close, Axtell has one more Mambrino Patchen cross through his dam. He also has one more Clay cross through Roving Nelly, the dam of Mambrino Boy. To still more enrich his pedigree he has another Mambrino cross and a Pilot Jr. infusion through his grandam, by Mambrino Royal, son of Mambrino Pilot, who was sired by Mambrino Chief, out of Juliet, by Pilot Jr.

The object of this comparison is not to illustrate the richer trotting inheritance of Axtell when tabulated in juxta position with that of almost any other trotting sire within the Register, but to note the changes which the outcrosses have made in both conformation and action.

Guy Wilkes had remarkably rapid action, rather high and short, for his hight, with that quick, drum-beat revolution that stamps himself and produce as pony-gaited. In no respect does it resemble the George Wilkes movement, having more roll of the knee and an energetic forward movement of the hind levers instead of the dragging action of his sire. Lady Bunker was by Mambrino Patchen, out of Lady Dunn, by American Star. Lady Dunn had trotting action that was all abroad—wide behind and far-reaching in front. More than that she toed out with distressing awkwardness. Her son, Joe Bunker, had the same excess of toeing out that amounted to malformation. The Mambrino Patchen family had a remarkably correct position of the fore feet, both at rest and in motion. Lady Bunker measurably corrected this toeing-out peculiarity in Guy Wilkes, but not to its total eradication; for nearly all the Guy Wilkes and Sable Wilkes campaigners at Terre Haute Park toe out. When this fact was mentioned to Mr. Goldsmith, he replied: "None of them are knee bangers. We have no knee boots in our outfit." Neither was Joe Bunker a knee banger, nor his dam Lady Dunn, but they wound their front feet so palpably toward the opposite knees that their destruction seemed to be imminent at every stride.

Now take the action of Axtell and his produce for the counterpart of the illustration. His dam, Lou, by Mambrino Boy, like her sire, has the straightforward movement, with a bold roll of the knee, quick, rather rapid, but well within her reach. She came honestly by this action inheritance. For Mambrino Boy's dam was Roving Nelly, by Strader's Clay, and he possessed this style of movement in an imminent degree. To add to the intensity of the inheritance, Mambrino Pilot, the sire of Mambrino Royal, had this same rapid movement, attended with a beautiful roll of the knee, and that sustained revolution which results from keeping the limbs and feet well up under the body in great flights of speed.

Axtell's gait then is not only perfect for extreme speed and courageous repeats, but has become, by the power of successive inheritance, on the side of his dam, absolutely typical. For instance, when his two-year-old son trotted a quarter in thirty-four seconds, being just one-quarter of a second faster than his great sire finished his champion stallion mile, in his three-year-old form, the assembled trainers and breeders involuntarily exclaimed: "He is gaited just like his sire." "If anything," observed the astute Hickok, "he reaches a trifle further in front," but the measurement of his stride shows this to be an optical delusion. Now the gait has become typical because the influencing gaits of the dam, and the grandam, and great-grandam all harmoniously contributed to this type. The inheritance being thus intense, the power of transmission must be more universally potent. This line of thought

has not received the thoughtful consideration that it demands from the more advanced breeders. That it will insure the success of Axtell, as the sire of a surprising average of swift trotting produce, is as certain from a biological standpoint as that structures of conformation and speedy muscular extensions will characterize them.

Prophets of evil have looked askance at the lameness that came to him from early work. These troubles were merely accidental. They overtake the majority of colts developed into phenomenal trotters before the bone structure can become perfectly matured. The writer puts this suggestive question to Mr. Goldsmith, just from the land where colts are universally trained to swift trotting, from weaning time, to win the yearling and two-year-old trotting champion records.

The question was thus comprehensive: "Take twenty promising yearlings, and "train them to make fast yearling rec-"ords, how many of them will stand up "under the strain."

The murderous answer came: "*You are fortunate if one in twenty remains sound.*" Mr. Hickok maintained that the average of sound colts at the end of the season would not be so great, and Mr. Doble earnestly agreed with him.

Axtell's limbs were no exception to the rule. His two and three-year-old performances injured him forward, and only the recuperation of two years of rest has restored them to soundness. But the ultimate danger of successive breakdowns is alarming. Infirmities, though in the first instance merely accidental, when repeated through successive generations, become chronic, and generally transmissible. Thus nothing is more painfully transmitted than inherited bad feet, and defective eyes. The curse of early training will more certainly tend to fix accidental defects than all of the breaks of nature combined. For instance, Axtell was temporarily injured by severe early training. His son Axle shows so much speed that he is liable to meet the same untimely fate. If this is persistently repeated, through successive generations, first Axtell, then Axle, then a son of Axle, and so on for several generations, defective limbs and break-downs will become as inevitable as the speed inheritance. Early maturity insures early decay. The infraction of physical law can not be made with impunity. Neither the brilliant performances of the Palo Alto colts, nor those of Axtell's produce, gifted as they are with marvelous speed, however humanely they may be handled, can prove any exceptions to this inevitable law.

But the great assuring fact in Axtell's history is that he did not come from broken-down parents or decrepit ancestors. Neither his sire nor his dam were the victims of early decrepitude. Neither his grandsire nor his grandam were precociously developed trotters. His heritage is soundness. His transmission is soundness, and if the Axtell youngsters become enfeebled, it will be the result of severe and precociously early development. The writer saw quite a number of weanlings and yearlings by him out of the choicest collection of broodmares ever gathered in one trotting harem. Cleaner joints, more perfect limbs, and sounder feet, were never placed under royal colts than have been transmitted to the produce of Axtell.

That his most promising sons and daughters may be considerately saved from extreme speed till the bone structure becomes thoroughly matured is to be earnestly hoped for, in the interest of the production of the perfected American trotting horse.

The progeny of Axtell has only reached the immature age of two years. Nothing can be predicated upon performance except upon the promise of the two-year-olds. Axle is the chief of these. No horseman would judge that he was less than four years old. Not only his height, but his breadth. Not only the development of his muscles, but the strength and power of his joints indicate almost the mature age of horsehood. More than all, his quiet, self-reliant, mental composure, both in the stall and during the excitement of great trials, in company, indicate a more mature age. He stands fifteen hands high at the withers, and fifteen hands two inches and a quarter over the coupling. His coat is brownish black in shade, with white ankles as his distinguishing markings. Not even

Digitized by Google

Chiquerita has a more pronounced trotting pitch. He is somewhat more plain in contour than his sire, with the single exception of his head, which is an exact reproduction of his sires, including, precisely, the facial expression. No more power and brain, no more balance and adjustment of carcass to the limbs, consistent with extreme speed, can be suggested in the present stage of development of the American trotter, than can be found in the organization of Axle. The writer, with other horsemen, was favored with a performance by Axle on the morning of June 13, with his enthusiastic trainer, Mr. Budd Doble, guiding his footsteps. The colt's name should have been Independence, to typify his disposition, for a more independent horse never was subjected to harness. He walks and jogs and speeds, as if there was nothing on the earth, in the air, or the waters under the earth, for him to fear. Company to him is amusement. Charles Doble was up behind the fleet Sea Girl to urge him onward. The speed of this gifted daughter of Wilton had no terrors for him. Some days before he was given his first mile trial in 2:43½. To-day he was expected to lower this mark at least five seconds. After scoring two or three times, with the steadiness of tried campaigners, the pair was off, head and head, with Sea Girl at the pole. The pace was increased to the three-quarter pole, when Axle was urged up to his speed. The last quarter was trotted in thirty-four seconds, and the last eighth in sixteen seconds—at the rate of a mile in two minutes and eight seconds! The second mile was nine and a-half, instead of five seconds better than his first trial. Sea Girl received more urging at the finish than did this wonderful colt in his second trial. Within the twenty minutes he was brought out for his second exhibition. Sea Girl, occupying her former position, accompanied him to the three-quarter pole, where a runner, in harness, lapped him on the outside. This strange mixture of new company seemed to amuse him. On came the three together, with a terrific brush of speed, the runner well extended, and Sea Girl doing her utmost to reach the wire in the lead. The phenomenal Axle, for the first time in his famous trials, acted coltish, by looking first at the trotter and then at the runner, till the playful swaying of his head and neck disturbed his balance, and he broke into a run, only to display the wonderful equanmity of his mental organization, by showing how quickly he could respond to the dexterous reminder of his master reinsman to resume the trot. With all this playfulness, and breaking at his highest rate of speed, he finished the quarter in thirty-seven seconds. If no misfortune happens to Axle he will eclipse the two and three-year-old performances of his illustrious sire.

This the only son or daughter of Axtell two years old the writer saw in harness. Drextell was shown in his box, and displays that reliable sense, great quality of bone structure, with the long racing muscular formation for which Axle is already famous.

The Axtell yearling Electell divided the honors with Axle at the trotting park, until his sudden death caused Doble to grieve over the loss of the colt, with whom he was confident of winning the rich stakes in which he was engaged. He, too, was a brown, much more beautiful in style and finish than Axle, but with the same display of power and speed formation; the same well sustained trotting stroke, carefully husbanded under the carcass, and the same earnest, determined, self-reliant composure that seems to be characteristic of the get of Axtell thus far tested. He was the first example of the cross indicated as extremely desirable in this paper—that of Axtell with the daughters of Electioneer. When it is remembered that his dam, Myra, was by Electioneer, out of Addie Lee, by Pulver's Black Hawk, the dam of Adair, 2:17½, and Adalia, 2:27, and of Grace Lee, 2:29½, at three years of age, the future value of Electell, both as a performer and a sire, had he lived, can be approximated. All the yearlings at Warren Park—notably those out of the richly bred Kentucky matrons, and the weanlings, show the imprint of Axtell in conformation and facial development, to the intense degree of a family type. They are strong, active, sensible, easily approached, and full of rapid trotting action. Never have the

Digitized by Google

fields of noted trotting-stock farms been graced with finer forms, cleaner limbs, stronger joints, than a stroll through the paddocks of Warren Park demonstrate are the heritages of the progeny of Axtell. Possibly not the least important characteristic in the blood elements of Axtell is the broodmare feature. This has never yet been considered by the turf press. In the earlier periods of the trotting problem there were distinctive broodmare sires. American Star, the Clays, Pilot Jr. and Mambrino Patchen stand in the front rank of these great broodmare sires. They all had the prominent quality of high-strung nervous organization that eminently fitted their daughters to become successful matrons, but disqualified them from establishing in the male line, constantly widening and accumulating trotting families. This feature can not be attributed to the lack of trotting blood, or formation, or action, or speed, but almost exclusively to their ecstatic nervous organization that made them unreliable on the turf. In the mysterious alchemy of blood combinations this temperamental peculiarity has become invaluable in the formation of the improved trotting horse. Without this element, possibly, there would have been no George Wilkes, or Electioneer, or Nutwood, or Pilot Medium, or many others of the leading trotting sires. But there has now been blended so many of these broodmare strains, in the lineage of the greatest trotting sires, that they will become noted through both the male and female lines of their progeny. They will inevitably become great broodmare sires, as well as the progenitors of great trotting sires. Among the number that have already thus distinguished themselves through their broodmare daughters are Electioneer, Nutwood, and George Wilkes. Richer in broodmare combinations than any of these, is Axtell, for his lineage reveals a double Clay cross, through both paternal and material lines, a double Mambrino Patchen infusion, as well as the magic Mambrino Chief and the still more magic Pilot Jr. foundation crosses. If American Star, and Harry Clay, and Mambrino Patchen, and Pilot Jr. were great broodmare sires, Axtell should be greater than all of them combined; for he is richer in broodmare elements, richer in speed capacity, greater in speed development, and superior in speed formation than all of them together. Indeed, the possibilities of such a sire, if he lives to the average age of horsehood, can hardly be exaggerated.

Reflections in this line passed through the mind of the writer as he contemplated the form and history of Axtell, on that beautiful morning in June. Being determined to ascertain the conclusions of the competent horsemen in his company, he requested that they be given an inspection of him stripped of all his blankets, and an adjournment was moved to his paddock. Thus this company of distinguished horsemen, consisting of noted breeders, famous trainers, and able representatives of the turf press, hung admiringly over the half-open door of the royal Axtell. Hickok remarked that he need never mark another mile on the race course, since a few of his sons, like Electell and Axle, have displayed their superlative racing qualities. Goldsmith added: "He is the perfection of the Wilkes cross, and I look for him and Guy Wilkes to carry off the honors of the family in the production and perpetuation of the most successful elements of the Wilkes strains."

When the writer put this question to his trainer: "Mr. Doble, which one of "all the great horses you have driven to "fame impressed you as the greatest?" there was a significant pause for the answer. This comprehensive question cast a reflective shadow over the pleasant features of the master reinsman. After musing for some moments, to the intense curiosity of his auditors, he began:

"Goldsmith Maid gave me the greatest "pleasure. I was then younger and more "enthusiastic than I am now. She knew "me as perfectly as if we were both "human beings, and I knew her just as "well. I drove her for ten years, and "during eight of those years she was the "queen of the turf. She administered "abundantly to my pride and to reputa-"tion, as well as to my pecuniary re-"sources, throughout all these successful "years. Dexter, of all the trotters I ever "drove, was the most tremendously in

Google

"earnest. His courage and speed were "never put to their extreme test, not even "in his memorable race against Ethan "Allen, when the old Morgan stallion "was carried through the air by his run-"ning mate. If Mr. Bonner had pro-"longed his stay upon the turf, as he "has, since that time, the careers of Maud "S. and Sunol, the best record of Dex-"ter would have been materially lowered. "But he was so resolute that his driver "had no time to dally with losing heats "nor even to acknowledge the salutations "of the admiring ladies that greeted him "from the grand stand.

"Gloster, the giant son of Volunteer, "was the coming king, when he was sud-"denly called to raise up all fours in "death. Gigantic as he was in size, he "was as easy to handle as a gentle pony, "and had he lived, I believe he would "have been the first trotting horse to "have scored a record of 2:10 on the "trotting turf.

"I have driven many others, some of "them with capabilities to lower the "stallion mark, like Delmarch, or the "best turf record, like Nancy Hanks, that "have fully enlisted my enthusiasm and "affection; but take him all in all, from "his ears to his shoes, both standing still "and in motion, the horse that has im-"pressed me the most profoundly with "his greatness—in every inch of his in-"dividuality—is Axtell! This is not all. "From the conduct of his sons, Electell "and Axle, I am satisfied his greatness "will increase in the augmented potency "and the more brilliant records of his "descendants."

It is remarkable how this exalted estimate of Mr. Doble, his trainer, coincides with the judgment of his breeder, Mr. C. W. Williams. When his three-year-old career ended with his transfer from Mr. Williams to his present owners, for the largest prize ever paid for a trotting horse to that date, and the most munificent price to this date, with the exception of Arion, Mr. Williams thus candidly wrote:

"Axtell is, without doubt, the greatest "colt ever foaled. He was bred to "twenty-two mares (in his three-year-"old form, and the produce of one is the "great Axle), shipped all over the coun-"try, trotted in 2:15½ and better six "times, and on five different tracks. He "was handled by a young man who had "no experience in developing colts. He "has never been driven a trial in his life. "He combines the blood of more trotting "families than any stallion that ever "lived. I think he has more speed than "any trotter I ever saw. He has the best "head. He is acknowledged by all "horsemen to be the best-gaited trotter "in the world. He goes with the light-"est shoe, five ounces front and three "behind. I know I shall never own "another Axtell."

In his catalogue for 1890, Mr. Williams thus supplements this exalted conception with a prophecy that has become an historical fact.

"I have unbounded confidence in Ax-"tell's future as a stock horse. His match-"less merit as an individual, taken in "connection with his rich inheritance of "speed and stamina, leads me to look for "extreme speed, with uniformity, from "his loins."

This prediction has been swiftly verified. No one in that notable group of trotting-horse admirers more conscientiously agrees with these corroborative estimates of Axtell, both as a performer and as a sire, than the writer of this paper.

HORSE SENSE.

BY A.

I.—THE article entitled "The Nearness of Animals to Man," by E. P. Evans, reprinted in the April MONTHLY, from the *Century Magazine*, was, without doubts read with pleasure by all who appreciate good things, not only on account of it, own inherent interest, but of the wide suggestiveness of the subject. The editor has all our thanks for placing the article where it could be studied at leisure by the breeders of the country.

As remarked, that delightful article was very suggestive. At least to us it has suggested two lines of thought in regard

Digitized by Google

to the horse, in his nearness to man. The first is the psychological—sense, aspect—the one treated of mainly in the article by Mr. Evans; and the other, the physical—organic, aspect. It is the first of these with which we here attempt, illustratively, to deal. It is impossible (for us) to deal with it in any other way. To do so is to assume that the animal treated of has reasoning powers that attain results in the same mode as man himself. This the writer can not claim to have any proofs of. We, personally, can't assume this, or attempt to *read in to* these "stories" human methods. And not having any means of analyzing or otherwise investigating the horse's "reasonings," we have no doubt whatsoever of his possessing such powers. We simply can't give "the horse" of it. Yet we believe the processes in horse and man much the same. From the scattered records of illustrations of horse sense here aggregated, other minds may be better equipped for this purpose, and may be able to arrive at more determinative satisfaction. We present some details that certainly can not be regarded in any other way than exhibiting the possession of a high order of sense.

Oliver Goldsmith, who tramped over Europe on Shanks' mare, riding bayard of ten toes, in his popular review of "Animated Nature" (prepared for Grubb street), was in a position to appreciate his statement that "the horse deserved a place next to man in the history of nature." The honest Goldie has since had many to support him in this estimate. But there have been those who depreciate such a view. To those we would recommend the following remarks in the opening paragraphs of William Henry Flower's late work on "The Horse:" "The horse is, from many points of view, one of the most interesting of animals. In utility to man it yields to no other. It was his domestic companion, friend and servant, before the dawn of history. It has accompanied him in his wanderings over almost every part of the surface of the earth, performing duties in peace and war which no other animal could have done, and given man facilities for the exercise of dominion over nature which otherwise would have been impossible to him. * * It is only in very recent times that the progress of mechanical invention has begun to supersede some of the uses for which the strength and the speed of the horse for many thousands of years have alone been available." That animal occupying such a position so close to man and so useful, in preference to animals much nearer the paragon in nature, surely shows that the horse must be possessed of no mean physical and especially mental powers. Such is the belief of all, we are not afraid to assert, who have been skilled in true horsemanship in all times and climes. By horsemen we mean those whose aim it is to develop the true inwardness of the horse sense, not those who endeavor to instil into the animal a foreign outwardness as is exhibited by the circus trainers in performing or "trick" horses.

M. Loyal, a prominent trainer of trick horses in Paris, is of the opinion that the horse is one of the dullest of animals. He says the horse has but one faculty—memory. "It must be forced to learn its tricks, which are imprinted on its memory by the whip if it resists, and presents of carrots if it obeys." Thus it is guided to success by the fear of punishment and hope of reward; by the way, quite a Christian philosophy. Compare this with the horse as seen in racing, hunting, herding, or battle—where his exertions have certainly an object that he can comprehend. Thus the feats of the circus, as remarks a recent writer, "depend for their popularity largely in forcing the animal to do what is contrary to his nature, such as strutting about on his hind legs, poising himself on pedestals where there is hardly room for his feet, lying down to be tramped upon by his master or mistress, balancing upon a narrow pathway in imitation of an equilibrist, and other things—the more out of the way the better in the estimation of the populace—in which a horse can take no interest and must lose that self-respect and pride which are so manifest in him under better circumstances. While these feats are astonishing they are rarely graceful or agreeable to the better taste." In the circus horse the idea of the trainer seems to be to train out of the equine, *i. e.*, to obtain the exhibition of, human-

Digitized by Google

like acts that require human personality.

The average horse can't be expected to "reason" that such trick acts are properly requirable of him. But there are evident indications that some performing horses have actually got beyond this state, and realizing, as it were, that they were expected to exhibit their intelligence by trick acts, have, as an actual result, accomplished miracles in that line and confounded even human intelligence.

The famous Marocco, the Bank's bald-faced horse, that had such a world-spread fame for his accomplishments in Elizabeth's time, one of whose wonders was the climbing the steeple of St. Paul's, was such a horse. It was said of this animal that he "shamed all the enchantments of the world." So declared Sir Walter Raleigh. Marocco and his owner were so much beyond human understanding that they were actually burnt at the stake, in Rome, as being the one a witch and the other possessed too much "of the devil." So far for *human* intelligence in those days.

Marocco's feat reminds us of the remark of a writer in comparing the horse with the bicycle, in which the horse was shown to be worthy of the preference: "He can come closer to going where a man can go than a bicycle."

The horse, moreover, in situations wherein something real, of himself, not ideal, outside of himself, is required, is "with us" every time. Besides this he can go beyond even this stage of intelligence and "act for himself."

Again another "intelligent" being writes: "In spite of the praise that has been heaped upon the horse, he is certainly, in our own country, one of the most senseless and helpless of all animals, timid, uncertain, and requiring much care and watchfulness. The reverse of this is the case in the courser of the desert." All this is unjust. To how many myriad uses do we not put "our" horse of which the desert population never dreamed? The oriental animal has only had one environment and one use for ages. The occidental horse is continually being put to new uses, struggling with new problems, facing new dangers, and continually succcessful.

The Standpoint from Which we Ought to Judge the Horse's Mental Powers.—We are inclined to refuse to believe, too, in the existence of the moral sense in animals, yet, *e. g.*, we assert that the peacock is "vain," the ass "stubborn," and the horse addicted to "vice." Articles have also been written on the "depravity" of animals. If we admit that bad exists we must admit also the good. In the limited, restricted sense of the term, animals exercise a restraint that is an example to the highest endowed animal himself. In a broader sense moral qualities may be defined as those that exhibit themselves in good or bad traits, exhibited of the animal itself, or to members of the same set, or individuals of another kind. Now it is generally supposed that vice belongs to the brute that can not reason, that morality is the result of the acquirement of the human form divine and its gift of reason. Taking the latter generalization as a test, and the human subject as the example, we find that man not only is near the brute, but even can outdo him in "brutal" depravity. Reason (the moral discriminator), steps in in many cases as an active, originating, organizing partner to vice. But this is simply the result of the endowments man has obtained supremely from beneficent nature; a higher level of discrimination of knowing good and evil, and independently the power to make the one aid or abet, or hurt or abate the other. Judging the horse from such standpoint it may be maintained that he compares favorably with man, considering his relative natural endowments.

The horse, as indicated by Dr. Lander Lindsey ("Mind in Lower Animals"), has the knowledge of duty, trust or task; a clear conception of his own duties and the duties of others, including man, in relation to himself. He has a feeling that his labor is worthy of hire, deserves a due meed of praise, credit and reward. He feels sore at unrequited labor, and at undeserved punishment he is resentful. Whereas, man, in relation to the horse, in too many instances exhibits the reverse of the desire to make a right return for the exactions levied on that animal.

The horse is possessed of a brain,

Digitized by Google

"small" though it is. And though the cerebrum does not overlay the cerebellum, it has convolutions. Now here is the point, exactly. We can't expect a larger crop, for example, from a field under less favorable conditions of soil, tillage, seeding, etc., as under more favorable conditions. For the amount of brain the horse has, we say he compares favorably with peerless man. Those that deny higher qualities to the horse should not expect him to have a brain at all. But he has, and thus confounds them. The mere fact of his possessing a brain, in our philosophy, which accepts the brain as the seat of consciousness and reason (the Chinese preferring the stomach), provides just so much reasonable and reasoning consciousness. The horse should not be depreciated, condemned, or blamed for the absence of man-like qualities that he should not be expected to possess. On the contrary he ought to be praised for the interpretation or exhibition he makes of the endowments allowed him by nature. We should not expect a horse to be able to tell to a minute the time of day, no more than we could expect a savage, who may never have seen a watch, to be able to do so by such means. Possibly in the human the power of doing so would be more readily acquired. Why? Simply because the approximation to the highest form of interpretative organism exists. Further, we therefore assert, it is an outrage on the ass and mule for man to arbitrarily "endow" these "drudges" with qualities of "stubbornness" and "obstinacy." It is not their fault—they are not to blame—if the brain development they are possessed of or have secured from nature as their concomitant interprets its capacity into acts or appearances which superior man translates from his altitudinous standpoint as to him, *stubbornness*. How did Byron reprove his thoughtless mother when she taunted him about the misfortune of his life? "I was born so, mother," the poet replied, shaming the very being that had conceived him.

But it was not always so with these "despised" animals, the mule and the ass. At one time, under different skies and environments, they were full of spirit and vim, and highly prized by man. If they have become "degraded" in man's estimation, why, let those who would, blame nature, not the animal.

So that we are strong in the belief that an animal should only be made accountable for the amount and quality of talents received. He does not know, he is entirely unconscious of the qualitative and quantitative tendencies of his guiding powers, just as man himself is unconscious of the working of his powers of "consciousness." The higher in scale the animal is the greater powers necessarily go along, of discrimination, by which he can become, if his powers are such as will allow him, conscious of the tendency to degrading viciousness or evil, and so eventually able to counteract and overcome the same. We see in the animal world wise individuals become wiser as they gain more experience of themselves and things. In the highest animal, we see born, as it were, prematurely, individuals which are certain to commit premature acts against the maturer standards of the race. This occurs in high and low born of the race; it is equally strong in each. The individual, simply as an individual among the whole, is condemned. It is not estimated that, in such acts, they but exhibit the function of the preponderating influence of a perhaps, too hurried nature. We blame the individual instead of the determining influences. Hence we say "he was to blame." He, in form and act has "erred from nature's honest rule," though the error is with nature, not the individual, hence is subject to nature's *justice*. He is judged and suffers accordingly. "Lynch law," "Coupar justice," are but examples of primitive human justice as exhibited in the assizes held by animals in the "wilds" of nature themselves.

What is the inheritance that causes these errors of nature? Whatever they are, the punishment is visited, not on what errs, but its reproduced consequence. This is hard on posterity. The "consequence" is condemned to struggle with a disadvantage. Here though endeavoring to fix the blame where it naturally belongs, when it comes to meting out compensation for good or bad

Digitized by Google

acts, reward or punishment, the race as a whole (as judges), never goes behind the individual, because it can't control the influences of nature directly. But this may be some time more possible. Still after nature has finished the product, some uncalculated influences may interpose to alter the whole course and character of the individual.

On the other hand, we praise the great deeds and qualities of certain individuals that are paragons among their fellows. These individuals are, or are not, puffed up with their own wonderful bigness, and show, all over, that they themselves deserve all the credit for their own gifts. They have *no* right to thank or praise themselves. They ought to be deeply thankful, and to praise the bountiful nature which has endowed them so signally. But they don't. They are as unconsciously remiss in this as they are active in blaming their less favored or matured fellows. This is consciousness—vanity.

So it is in the whole range of nature. Different animals but exhibit different degrees of perfection of formation—or maturity of body or mind. As the individual has an immature child-nature, so has the race itself; so has all the animate of nature. These of the sensate world "rise on the stepping stones of their dead selves to higher things." It is true that

> There is a divinity that shapes our ends,
> Rough hew them as we will.

A sublime influence is the great cause of present existence.

We have gone sufficiently far in this line to indicate that any particular animal, considered as an animal possessing an organ of consciousness—which is yet an unconscious functional exhibitor of certain phenomena or development of deeds—occupies its place in the whole according to its endowments. So, as there must be degrees in this endowment, we should not expect more than may be fair. But within these degrees there are greater or lesser excellences, just as there are, for example, in a class of graduates. There are, necessarily, extremes. These illustrate, personify, the possession of higher or lower, or influenced, endowments, exhibiting various degrees of anxiety to make the best mental use of the physical gifts acquired, in good, bad, or indifferent paths, indicating the means existing to exhibit, in organic action, the various powers of ratiocination. There may be higher mental powers than are usually found in the accompanying physical conformation. These powers are generally, however, limited by the physical, in the long run. Sometimes the formation, though "low,'" seems to be adaptive far beyond its position in the general scale. The ants have the largest brain, according to their size, of any animal.

The plain fact of the matter appears to have been that no "reason" was deemed possible except in the "animal" that had in reality the human form divine.

In considering this question critics have compared man in his highest development to brutes in their lowest. They knew that if they had to admit degrees in each their foundations would be removed from them. But, in fact, "many of the inferior races of man are absolutely inferior to many inferior brutes. The inferior brutes are often superior to the human child, representing the early stages of the race." The worst forms of humanity are worse than the brutes. Oft times the horse exhibits more sense than his master.

Horse Sensations.—The horse has been depreciated, for example, for his action in the fire that has overwhelmed his stable; when removed and put at a safe distance, he will madly return and rush to his fate in the flames. This may be paralleled in the human kind, by instancing the conduct of the latter in a fire that has paralyzed them in, for instance, a theater. Here the unreason is as supreme.

In both cases panic is complete and overcomes the reason in either that, exerted, would have saved them. This flight of reason, under such peculiar excitement, seems to be their common lot, and contrasts strangely with the heroism of other occasions when facing death at "fearful odds."

The horse is a creature of habit, has his antipathies and aversions just as man. He shows, for instance, the strangest aversion to a camel. He is subject to natural fears, as man. See how he flees from an approaching train,

Digitized by Google

just as some of us feel terrors at a thunder storm, and hide from it till accustomed to it. At other times the horse associates the thunder storm with battle, as man associated the same with the wars, or anger of the gods. He is subject to the effects of custom in these cases, just like his master. Experience teaches him, likewise, *sang froid.*

Among wild horses the herds choose their own chiefs, who lead and command. If danger is scented a halt is made and the leader takes the front to discover or to give direction as to the action of the whole. If the leaders deem it necessary to fight, the mares act as guards the while.

The horse is capable of strong affection, not only to his own but to other kinds, including man—his god. His senses are all remarkably acute. His sight is particularly good in the dark. He can discover the existence of water in the distance. He can also "scent" danger ahead.

He is said to be emotional and to have a good memory, which some assert is "his sole mental endowment." This we submit is easily controverted.

On the other hand, a horse is subject to a species of insanity. Any one who knows what a "dummy" is can support this statement. Those positive and negative evidences of "conscious" powers argue at once the possession of brain power by the horse. Intelligence is generally indexed in the countenance, face or head. So it is in the horse. "I never ask about a horse's traits," a horseman has remarked, "all I want is a good, square look in his face." The eye, the ear, the lips, the poise or motion of the head, all are indicative to a close observer of the good or bad tendencies of the animal. To have luck the horseman must be a penetrative observer. An old saying was that, "He that would have luck in horseflesh must kiss the parson's wife." But the horseman has now to withdraw his attentions from such a moral impossibility and confine himself to increasing his personal acquaintance with the face of the equine as indicative of the brain power behind the eyes.

Mr. Dottridge, who selects all the horses which compose the black brigade of London, the funeral-coach horses, which are imported from Holland and Belgium, "can tell them by the peculiar glance they give as they look round at me. The whole manner of a horse, as the whole manner of a man, betrays him. Even his nose will tell you. I never knew a horse with a Roman nose to be ill-natured."

Anecdotes of animals, meant by the good people to exhibit faculties, as it were, given to them at the certain occurring time by an all-wise Providence, to accomplish some wonderful necessary act, and then deprived of the power thus only apparently given temporarily, are often subject to the charge of working into the actions of the animal's human modes of reason and understanding, which makes them often ridiculous. In relating a horse "story" the narrators often seem to forget the possibility of the animal being possessed of horse sense of its own. They explain into the horse of it actual human motives. This manner of telling often lends them an undesigned interest to a certain class. They explain the incident as if the horse had an entirely human mode of looking at things.

A horse that used to convey two well-known disputants took advantage of the heat of argument and slackened its pace during the same. It was supposed to regulate its pace by the degree of the flow of soul occurring between its human superiors, instead of the slack on the rein.

Classification of Illustrations.—In our arrangement of our illustrations of horse sense we take an arbitrary method—we group them more for convenience—not according to particular "senses" or methods or degrees of mental attainment. This will be doubtless more satisfactory to the reader. And let us say here, we only wish to repeat facts. As said, we don't wish anyone to fall into the error of reading into every uncommon act of an animal human intelligence. All we aim at is to illustrate the fact that the animal is necessarily endowed with what, for want of a better term, may be called specific sense or intelligence, *i. e.* an intelligence equal or becoming its place in nature. We don't mean to inculcate any hopes of obtaining the impossible; but to direct attention to the cultivation

Digitized by Google

of the possible. The anecdotes are simply retold, therefore, in the words of the narrators. But, taken as a whole, possibly, never previously have so many been collected together—they will afford a mine for the psychological student who can divest them of what is *not* horse. The horse is quite fit to stand in or on his own shoes. Perhaps as the human presents the highest test, the horse may have to be content to "suffer" comparison with the master.

Memory.—In one of the Buddhist legends it is said: "Even the beasts remember the services once rendered them, and when we implore them, they do not desert us, for they know what has happened." Memory was thus one of the earliest noticed faculties of animals.

The following appeared in a Dublin paper, April, 1865: The driver of a baker's cart, which made a daily journey from Dublin to Kingston, six miles, was by accident, just at starting, thrown from his seat, unsensed, and carried to the hospital. The question then became, how was his load of bread to be delivered, at which houses along the way? It was determined to leave the matter to the old mare. She was started from the usual spot, and allowed to pull up whenever she showed inclination to do so. Before her journey's end was reached, she had stopped at 160 houses. Almost without exception it proved that at each of these dwellings there was a customer expecting bread. She went through streets and squares almost without a mistake. The new driver found that he had been able to make his round almost as effectively as his unlucky predecessor.

A horse accustomed to be employed once a week on a journey with the newsman of a provincial paper, always stopped at the houses of the several customers, sixty or seventy in number. But further, there were two persons on the route who took one paper between them, and each claimed the privilege of having it first on the alternate Sunday. The horse soon became accustomed to this regulation, and though the parties lived two miles distant he stopped once a fortnight at the door of the half-customer at Thorpe, and once a fortnight at the door of the other half-customer at Chertsey, and never did he forget this arrangement, which lasted for several years.

A horse belonging to a gentleman of Taunton strayed from a field at Corse, three miles distance from thence. After a long and troublesome search, he was discovered on a farm at Branscombe, in Devon, a distance of twenty-three miles, being the place where he was foaled, although it is certain the animal had not been there for ten years, during which time he had been in the possession of the gentleman who owned him.

The friends of a certain cattle-jobber were anxious to discover at what houses he spent his time. By obtaining the use of his old pony they were guided to the public houses frequented by him. By this agency some very marvelous pieces of trickery were unraveled. Another story is told of a precise old gentleman, who, having purchased a pony for driving, was annoyed by the animal's stopping at every public house that he passed in his drives. The pony gave sure indication of the habits of its former owner.

A similar story to the well-known one of Kosciusko's horse is told of a lawyer, who, in London, requiring to buy a horse to make a journey into the country (it was the olden times), felt very lucky in obtaining a perfect horse at a ridiculously low price. He congratulated himself on his skill in the trade. He had proceeded some miles out of town when he approached a carriage. As the horse the lawyer bestrode came alongside, the animal came to a sudden halt, and lay back on his haunches. At the same time a trembling hand was extended from the carriage window holding forth a purse and various pieces of jewelry. The lawyer's surprise was almost too much for him to offer any apology. Next he met a party on horseback, and the horse had no sooner repeated his former act, than the rider was confronted with the gleaming barrel of an ugly pistol. This incident having eventually ended pleasantly, the lawyer proceeded on his dubious way rejoicing. As he reached the first stage on his journey "friends" were evidently awaiting his arrival; for he was at once arrested. The horse was a "dead give away;" having formerly

Digitized by Google

been the property of a noted highwayman.

Mrs. Lee relates an interesting story illustrating memory and association of places and things in the mind of the horse: "A friend told me that a horse had been in the habit of going with his master a certain road and stopping at the same inn, when those who fed him always threw some beans into the corn put before him. After a time he and his master went from that part of the country and remained away for some years. Then the same habits were resumed and the same inn frequented. The inn, however, had changed owners. While enjoying his dinner the rider was informed that his horse would not eat; that he appeared to be perfectly well, but that there must be something wrong with the corn, which they could not understand, as it was of the best. The gentleman went to the stable. The horse neighed, then looked at him and then at the manger. It suddenly struck the owner that the animal missed the food that he had been accustomed to receive there and nowhere else. 'Throw some beans in,' he said to the hostler. This was done, and the horse looked his thanks and proceeded to his meal."

Gen. Pater, of the old East India service, was a remarkably fat man. While stationed at Madras he purchased a charger, which, after a short trial, all at once betook himself to a trick of lying down whenever the General wished to mount him. Every expedient was tried to cure him of the trick, and the laugh was so much indulged against the General's corpulency that he found it convenient to dispose of the horse to a young officer quitting the settlement for a distant station up country. Two years having elapsed, in the execution of his official duties the General left Madras to inspect one of the frontier cantonments. He traveled, as is the custom in India, in his palanquin. The morning after his arrival at the station the troops were drawn out. As he had brought no horse it was thought best to provide for his being suitably mounted, though it was a task to find a charger equal to the weight. At length an officer resigned to him a powerful horse for the occasion, which was brought out duly caparisoned, in front of the line. The General came forth from his tent for the purpose of mounting. But the instant the horse saw him advance he flung himself flat on the sand, and neither blows nor entreaties would induce him to rise. It was the General's old charger, who, from the moment of quitting his service had never once practiced the artifice until this second meeting. Fortunately, the General was an exceedingly good-humored man, and joined heartily in the universal shout that ran through the whole line on witnessing the ludicrous affair.

Col. Hamilton Smith (author of the well-known volume on "The Horse" in the Naturalist's Library) was recognized by his old charger three years after they had parted. The Colonel was traveling by the mail-coach, and while the horses were being changed his attention was attracted by one. At the same moment the animal rubbed his head against his arm. The recognition was complete on both sides, being, however, more vivid and ready in the quadruped, for, while the Colonel was looking doubtfully, the charger showed an unhesitating recollection.

"*Homing*" *Instincts.*—A farmer residing on the borders of the New Forest, in Hampshire, went over to the Isle of Wight, and there purchased a mare near Newport. The mare was put into a passage-boat, conveyed to the Hampshire coast, and, when landed, was taken to the purchaser's residence, and afterward turned into one of his fields. The next morning the mare was missing. Search was made for her, but she could neither be found nor heard of, and it was supposed she had been stolen. The farmer soon afterward had occasion to go again to the Isle of Wight, and on mentioning his loss to the person from whom he had purchased her, he was informed that she had safely returned to the premises of her former master. The nearest distance from the Hampshire coast to the Isle of Wight is five miles, although the mare probably had to swim a much greater distance. A horse was turned out in some marshes adjoining the Thames. The distance in a

Digitized by Google

straight line from his owner's house was only a few miles, but he had to be sent a long way round to cross the bridge. In less than twenty-four hours he made his appearance at the stable door dripping wet, having swam the river and taken a straight course home. The London *Times* printed this: A young gentleman named Keene had been for sometime resident near Malton, and from Mr. Rutter, of Hissle farm, he bought a hunting mare, which, on leaving Malton, he recently took with him to Whitby. On Wednesday the mare was missing from the field, and a search was instituted, but to no purpose. On Thursday the search was renewed, Mr. Keene and his groom going about ten miles on the Guisborough Moors, and then to Sleights, where they heard the mare had crossed the railway the previous morning. At this point the trail was easy. The mare had taken the high road homeward, and at Saltersgate six men tried to stop her, without avail. At Pickering she jumped a load of sticks and the railway gates, and then found herself in her old hunting country, making across Rysdale for "home." In so doing she had to cross two rivers and a railway. Mr. Keene found her at home on Thursday night, with one shoe thrown and rather lame, but otherwise no worse for her cross-country cut of nearly sixty miles, done in one day, for her previous owner found her standing on the Wednesday night at the gate of the field where she had grazed for the previous two years. A horse in the interior of Australia, after two years of quiet residence on his run suddenly was lost to his owners. He was heard of 100 miles away at the run of the old master from whom he had been stolen years before.

In completing the original Erie canal a pier or dam was erected — up and down the river, and opposite to Blackrock (a village two miles distant from Buffalo, and on the American side of the river Niagara), at no great distance from the shore, for the purpose of raising the waters of the Niagara to such a height that they might be made to supply an adjoining section of the Erie canal. This pier proved a great obstruction to the ferry boats that plied between Blackrock and Waterloo, on the Canadian side of the river. Previous to its erection passengers embarked from *terra firma* on one side of the river, and were landed without any difficulty on the other. But after the dam was constructed it became necessary to employ two sets of boats — one to navigate the river, and the other the basin, so that all passengers as well as goods or baggage, had to be landed on this narrow pier and reshipped. Shortly after the erection of the pier dam, a boat propelled by horses was established between this pier and the Canadian shore. The horses moved upon a circular platform, which consequently was put in motion, to which other machinery was connected, that acted upon paddle wheels attached to the sides of the boat. The boat belonged to persons connected with the ferry on the American side, but, owing to the barrier formed by the pier, the horses employed on the boat were stabled at night in the village of Waterloo. The introduction of a boat of that description was considered an event of some magnitude. The two horses, for that boat had but two, worked admirably, considering the very few lessons they had had upon the treadmill, as it was called, previous to their introduction upon the main river. One of the horses employed on the new ferry boat had once been a dapple-gray, but had become white. He was still hale and hearty, for he had a kind and indulgent master. The first evening after the horses had been a short time in the stable, to which they were strangers, they were brought out for the purpose of being watered at the river, the common custom at the place. The attendant was mounted on the bay-horse — the white being known to be so gentle and docile, was allowed to drink where he pleased. The narrator happened to be standing close by in company with the ferry contractor, on the Canada side and thus had an opportunity of witnessing the whole proceedings of old Grizzle, the name that the white horse went by. The moment he got round the corner of the building so as to have a view of his house on the opposite side, he stopped, and gazed intently. He then advanced to the brink of the river, when

he again stopped and looked earnestly across for a short time. He then waded into the water until it had reached his chest, drank a little, lifted his head, and, with his lips closed and his eyes fixed upon some object upon the farther shore, remained for a short time perfectly motionless. Apparently having made up his mind to the task, he then waded further into the river until the water reached his ribs, when off he shot into deep water without a moment's more hesitation. The current being so strong and rapid, the river boiling and turmoiling over a rocky bed at the rate of six miles an hour, it was impossible for the courageous and attached animal to keep a direct course across, although he breasted the waves heroically, and swam with remakable vigor. Had he been able to have steered his way directly across, the pier-wall would have proved an insurmountable barrier. As it was, the strength of the current forced him down to below where the lower extremity of this long pier abuts upon an island, the shore of which being low and shelving, he was enabled to effect a landing with comparative case. Having regained *terra firma*, he shook the water from his dripping flanks, but he did not halt over a few minutes, when he plunged into the basin and soon regained his native shore. The distance from where Grizzle took the water to where he effected a landing on the island was about 700 yards. But the efforts made to swin directly across, against the powerful current, must have rendered the undertaking a much more laborious one. At the commencement of his voyage his arched, neck and withers were above the surface, but before he reached the island nothing but his head was visible. He reached his own stable-door to attain which he had risked so much, to the no little astonishment and admiration of his owner, who vowed that if the horse performed the same feat a second time, he would retire him from the ferry. Grizzle was sent back the next morning, but embraced the very first opportunity that occurred of escaping, and repeating his wonderful performance of the preceding evening. The result was that his owner was as good as his word. And Grizzle was ever after a privileged pensioner on the good man's bounty.

(*To be continued.*)

THE THOROUGHBRED TROTTER.

EDITOR OF THE MONTHLY:

On two or three previous occasions we have advocated an advanced standard for trotting horses. At the present time we are more than ever convinced that in this way the non-trotting element can be eliminated from our trotting families. The day of trotters that can't trot is fast passing away. The question is, can we collect and combine a family that will be not only trotting-bred, but descended from nothing but performing blood.

In our former discussion of the matter in hand it was suggested that a rule be established naming and defining a thoroughbred trotter (WALLACE'S MONTHLY, Vol. XVI, p. 878). the position was taken that a thoroughbred should be an animal that had in its ancestry, for five complete generations, nothing but standard-bred animals. We have, after more mature deliberation, concluded that still another qualification should be required of the thoroughbred. We must not only have the primal progenitors of our thoroughbreds trotting-bred, they must also show they are, in fact as well as in breeding, trotters. Hence, to eliminate non-performing blood and to establish a race of thoroughbred trotters, we would, with all due deference propose to the National Association of Trotting Horse Breeders that they establish the five following rules:

Rule 1. A thoroughbred producing trotting sire or dam is defined to be a stallion or mare that is standard, and whose ancestors are each and all standard in the first, second and third remove.

Rule 2. A thoroughbred trotting stallion, mare or gelding is one whose sire and dam are each thoroughbred producers, as defined in rule first, and which stallion, mare or gelding shall also have made a trotting record, according to the rules approved by this association, in two minutes and thirty seconds, or better.

Digitized by Google

Rule 3. The produce of a sire and dam which are accepted and recorded as thoroughbred trotters, as defined in rule second, at the time of the birth of such foal, shall also be a thoroughbred trotter.

Rule 4. The produce of a thoroughbred sire and dam each, as defined in rules second or third, shall be a thoroughbred trotter.

Rule 5. No animal shall be accepted as a thoroughbred or thoroughbred producer, as above defined, until his or her breeding is proven and the animal is duly recorded in the stud book kept by this association for that purpose.

The result of adopting these rules will be that every strain of blood in the thoroughbred traces to a 2:30 performer. There will not be the faintest tinge of blood which has not at some time demonstrated to the world that it is trotting blood.

A secondary result will be that ranks will be established in the present trotting family. Sires and dams will rank in proportion to the number of removes they are from the thoroughbred producer.

We believe that with these rules as supplemental to those we now have defining the standard trotter, a grand family of American trotters will surely result. The great thing to be avoided is too great haste in the application of the rules. That is, we must not be in too great haste to be in the thoroughbred producing rank. There is nothing to prevent the ancestors of the thoroughbred being performers. Indeed many of them will be, otherwise the breeding will be remarkable for its weakness rather than its strength.

Hambletonian 10, Abdallah 15, Mambrino Chief 11, Bashaw 50, Daniel Lambert 102, Blue Bull 75, and many other great sires whose dams are not standard will make grand foundations in the pedigree of the future thoroughbred. But they must remain in the foundation. They can not be advanced a rank or course higher, nor is it necessary. We have better building stone for our second course in Electioneer, George Wilkes, Nutwood, Almont, Belmont, Happy Medium, Onward, and many more.

For the third rank, the sires of the thoroughbred producers, while our selection must be, in the main, from young sires, we can still find them great. There are Baron Wilkes, Fairy Gift, Guy Wilkes, Jay Bird, King Rene, Pancoast, Pilot Medium, Princeps, Stamboul, Stranger, Sphinx, etc. The thoroughbred producers are now being produced by many breeders. We frequently see catalogues calling attention to the thoroughbred producers therein contained. This shows that the idea of a thoroughbred trotter prevails. Let the rules suggested be adopted, and the efforts of all breeders will be directed to the thoroughbred. Whether their efforts have been well directed or not the impartial measure contained in rule three will surely disclose.

Jno. M. Hemingway.

Hampton, Iowa, June 23.

THE HORSE IN AUSTRALIA.

BY HEATHERBLOOM.

The first importation of horses to Australia took place in the year 1788. The importation consisted of three mares. They were shipped from the Cape of Good Hope, then a Dutch colony, for the first governor, Capt. Phillip. Indian and Arabian horses, and Timor ponies followed; and at a later date the early settlers obtained from Valparaiso a shipment of perhaps the worst horses ever imported into any country. "Ultimately the more enterprising colonists began to import from Great Britain. These importations were the source of the horse stock in common use to-day in the colonies." In 1800 there were 168 horses in Australia, now there are 1,500,000 on the continent, and they are increasing at the rate of about 30,000 per annum. Eighty per cent of these are saddle and light-harness horses, the remainder are thoroughbred, draughts and ponies. The opening up of the Suez canal first made it possible to improve the fast deteriorating horses by large importations.

With the exception of the race horse, we are informed by George L. Singleton, which is forced in its growth much the same as in the mother country, non

Digitized by Google

of the horses are ever under roof from birth to breaking. In the pastoral districts the system of breeding and management is centuries behind the times, and there is nothing that is suggestive for notice.

There are now only a very few large studs. Wool and beef pay better. This is rather remarkable, for there has been a constant market for all the horses the country could produce, of a kind suitable for cavalry remounts, to India.

The influence of soil is evidenced in the qualities of the horses bred in the various districts, while within certain limits neither latitude, altitude, nor character of soil appears to greatly influence the quality; for good or bad are reared side by side on the various stations from the south to well within the tropics, from an altitude of less than 100 feet, to upward of 2,000 feet on almost every geological formation. Yet it is found that horses reared on some of the artificial grasses grown on the alluvial flats of the more southern rivers are wanting in stamina, nor are those bred immediately on the coast to be depended on for staying, while horses that have been raised in country influenced by the coastal rains within the tropics are decidedly inferior.

Horses bred in the interior within the area of scanty rainfall have better feet and more endurance than horses from the southern parts. In some places where ironstone comes to the surface, horses have to be shod before they are turned out, and even these protections get very hot.

Resulting from the carelessness of the early squatters or station owners in Australia in the management of their studs, many animals escaped to the wilds. They multiplied remarkably as their distant relatives did similarly in America. The escapes developed wonderful sagacity in avoiding the wiles of the sportsman. They became, too, perfect marvels of ugliness in appearance. They are regarded as a nuisance, being of no use and consuming pasture that ought to be better utilized. Besides, they sometines invade the more improved regions they formerly avoided. A price is set on each head in some districts. Hence his destruction is quite an object, and affords occupation to a certain class of "industrialists." These wild horses are called "brumbies" by the colonists, and they play the mischief with the domestic stock, trysting many a noble animal away from the comforts of station life to the degradations of wildness. In 1875 over 7,000 of these brumbies were slaughtered in New South Wales alone. Like the bison in America, the hide was all that was utilized for long. But latterly the carcases have been "boiled down," as they did the sheep, for tallow. Many of these horses would make excellent servants if there was only a place to use them in. A short time ago a resident of Victoria rode from the Gulf of Carpentaria to Brisbane, nearly 1,000 miles. On reaching the latter place, having no further use for the faithful horse that had carried him so well so far —"a real plucky animal, with legs of steel"—he entered the beast and the saddle and bridle at the sale yards. The "articles" were put up in lots. The saddle fetched 15s., about $3.50; the bridle 2s. 6d., about 50 cents, and the little steed who had carried man, saddle and all the long distance was knocked down for "a shilling," or less than 25 cents.

The energetic Prof. Robert Wallace, of Edinburgh University, has recently published a remarkably clever work on "Australia and New Zealand," treating of their agriculture and rural economy, in his usual facile, masterly style. This work is a worthy companion to the same author's no less remarkable work on "India," published in 1887. The two works would, alone, form a monument to any man's indomitable perseverence and literary skill. They have taken their places as classics in the language, and will be referred to in the future by all who wish to become posted on the various important subjects therein embraced. The amount and variety of subjects treated are marvelous. The works are perfect storehouses of information. The general reader will find every page presenting something interesting or novel. The special reader—and now we speak from a horse-loving point of view—will discover several val-

Digitized by Google

uable chapters on the horse, as found in these remote regions, which are well worth perusing. In this place we shall confine our study to Australia which, in many ways, is coming into such prominent notice politically and commercially in this country of late. It will be seen that Australia may be reckoned already as an important market for the highest, as well as other, product of American breeders' art. We are convinced that those foreign markets are destined to be of much value to the American breeder. So some acquaintance with them seems desirable. They ought to be fostered and cultivated. The following particulars are prepared from Chapters XXIV–V of the work noted.*

Thoroughbred horses in Australia are of the "first water," although their performances in Europe have fallen far short of sanguine colonial expectation. The best blood has been imported, and breeding carried on in the most systematic and perfect manner since the early days of the colonies. Doubtless, too, the breed has profited by the change of habit at, as in more than one event the record has been beaten on Australian courses. The credit, however, must be shared with the salubrious climate and the condition of the race course. There is no sport in which a wider or more profound interest is taken in these colonies than in racing. Every little town has its race course, and large cities can count theirs by the dozen. Melbourne, for example, possesses twenty within a radius of a few miles, and it is no exaggeration to say that a Saturday without a race meeting at one or more of these places would be an anomaly. If an opinion might be ventured it seems as if racing were too widely and too well appreciated by classes who can afford to spend neither the time nor the money which its indulgence naturally absorbs.

The two largest studs in Australia are those of (now the late) Mr. Andrew Towne, of Richmond, near Sydney, and of Mr. Samuel Gardener, of Windora Park, near Melbourne. Mr. Towne's stud consisted of 200 thoroughbreds, besides fifty American trotters, and 200 others. He used to dispose of about 100 yearlings in January. In 1889 these realized 120 guineas each. In this stud among many animals equally famous was Grand Flameur, a bay horse, which ran in nine classic races in Australia, and never was beaten. Mr. Gardner's stud numbers in all over 220 thoroughbreds. With the object of increasing the breeding stock, none have been sold since 1887. As in Mr. Towne's stud, the greatest possible care is taken in the mating, and also in the treatment and management of the animals.

One of the great excitements of the sporting world during Prof. Wallace's visit was the departure for England of seven thoroughbred horses—Kirkham, Narellan, Wentworth, Nepean, Mons Meg, a bay yearling colt, and Plutarch, from the famous racing stud of Hon. James White, of Sydney. It was made no secret among Australian racing men that Mr. White would win the Derby, and many, if not all of the best races in England. The only fear expressed was that the horses would be disqualified for some races in the event of the death of Mr. White, which was not unexpected, and happened shortly after. Mr. White's death led to the sale and dispersal, not only of the horses sent to England, but of the home stud. It was amusing to a stranger to observe the confidence of the Australian sons of the turf as to the certain success that was in store for Mr. White's horses in England. The European record had been beaten on more than one occasion in Australia, but as an offset to that must be placed the fact that the new world has a clearer and purer atmosphere, and the condition of the course, which is there absolutely under control, can be adjusted to suit the climate and requirements. These, especially the difference in atmospherical conditions, are serious drawbacks to the unacclimated aspirants to "the blue ribbon of the turf."

The results of the plucky and popular action on the part of Mr. White are therefore not to be wondered at. Up to the sale at Tattersall's on the occasion of the second October meeting at Newmarket, only one of the animals in question, viz.: Kirkham, had ever started, although

*"The Rural Economy and Agriculture of Australia and New Zealand." By Robert Wallace, F. L. S., F. R. S. E., etc.

Digitized by Google

more than a year had elapsed since their arrival. It is to be inferred, as a reason for withholding them so long, that they were not in fit condition. It is stated on the authority of Mr. William Day, of Salisbury, that the performances of Kirkham on the three public occasions on which he had appeared were not nearer than perhaps twenty-one pounds to two stones of many English-bred horses. The full effects of the excessively long and trying voyage, and the radical change of climate and country had not been taken into account by those who had expected so much so soon. It is quite possible, however, that we may hear yet of these Australians. Some of the prices realized at the sale show that they are expected to come to the front. This expectation is fully warranted by the build and appearance of the horses themselves, as well as by the stock from which they spring.

The average price realized for six sold in England, October 8, 1890, was 1,210 guineas, the highest prices being 1,700 guineas, and 2,600 guineas for Wentworth and Mons Meg respectively. The average of the sale of the Australian portion was, for thirteen animals, 1,281 guineas. The highest price was 4,600 guineas for a gelding Titan. Three others realized 2,000 or over. The grand total of the two sales was £23,725, a small sum as compared with what such animals would at one time have brought at the hammer.

American trotting horses are becoming increasingly popular to the young and sporting Australian. Trained from youth to appreciate a good galloping competition, his taste is decidedly developing in the special direction of trotting performances. "Though it is not to be expected that a trotting contest will ever develop the same amount of interest and excitement among a crowd of spectators as a good gallop, yet there is something marvelously attractive about the movements and style of a well-trained trotting horse —something which an ordinary unskilled and non-sporting observer has time to see and ability to appreciate." The American trotter, from which the representatives of the class in Australia are directly descended, had an origin similar to that of the race horse or "blood" horse of England. But the two breeds are now quite distinct from each other in appearance, the form having differentiated with the development of the various parts which are brought specially into play by the different methods of movement involved in trotting as compared with galloping.

This breed has been beautifully trained in America for many generations, and there is little doubt that the naturally tractable disposition of the young animals born in Australia is due to heredity, a fact which would be a serious blow to Weismann's anti-heredity theory if it could be practically demonstrated. This is, however, one of those things well known to men of experience in such matters but which is difficult or impossible to prove in concrete form to one who is without experience.

Training in Australia, as in America, is begun at a very early age and has to be regularly kept up to the extent which the animal will stand without breaking down. Trotters, like thoroughbreds, are "run" as year-olds, and many are in consequence sacrificed through overtraining in the effort to please a depraved public appetite for grand youthful performances. The "baby trotter" is asked to do what is beyond its power at the time, but what becomes natural and easy to it a little later. The result is that even the winners that are able to pass through both training and competition with most success get bent and shaky in the forelegs and prematurely old. But, from the breeders' and trainers' point of view, the public taste and demand must be considered before the animals themselves. Compliance with public demands means money, when it is remembered that the yearly sales of Mr. Towne's trotting stud, produced from cross-breeds as well as pure-bred mares, averaged in 1889 123 guineas for youngsters of but one year off, a shade over the average made by the galloping thoroughbreds. People will not buy trotting horses, however good-looking, unless they can go.

In his former work on "India," the Professor remarks: "The English thoroughbred has been converted into a galloping machine, worthless for almost all but racing purposes. The American trot-

Digitized by Google

ter sprung exactly from the same stock, but having been bred in a different direction, and having retained or even increased its substance, is much more serviceable." In his "Live Stock of Great Britain." he declares, with emphasis, that "the American trotter is now practically a thoroughbred." It will thus be seen that the Professor is an appreciator of the American product of horse breeding.

The light harness horse (other than American trotters) in Australia is of mixed origin, Cleveland bay, Yorkshire, American trotter and a dash of German coach blood enter into the composition of this class of horse. A decided improvement in quality has recently taken place. The Australian saddle horse not only maintained the credit of his English ancestors, but actually outstripped them in size, stoutness and endurance. He may even yet lay claim to the distinction of ranking among the best saddle-horses in the world, notwithstanding the fact that he is not now so good as he formerly was. Early training is an essential point in developing the Australian saddle-horse.

PROBLEMS IN FARRIERY.

BY S. T. H.

The Physiological and Mechanical Action of the Foot.

If the natural pressure of the hoof is primarily upon the wall at the heels, and then as the foot revolves, at the toe, it follows that the pressure of the shoe should be mainly confined to these sec tions. The rings of growth of the wall indicate the accuracy of this conclusion. The rings descend at the heels and toes and rise at the quarters, showing the growth at the quarters is less than at the extremities. The unpared, unrasped colt's foot will present no bearing at the quarters when the smooth surface of the rasp is extended from the heel to the forward arch of the hoof. Now the wall at the quarters is thinner for a dual reason. The quarters are immediately opposite the wings of the coffin bone. If the wall was dense and thick there the wings of the bone would be much more liable to injury in case of contraction than if it was thin and more yielding to internal pressure. Again, the thin quarters admit of much more expansion at the heels than if they were strong and thick; and the expansion of the foot can only be in the posterior portions of the foot from the centre of the quarters to the heels. This capacity for expansion is materially lessened if the shoe presses firmly upon the quarters, and, as is the ordinary custom, nailed well back toward the heels. Unless the hoof is already too much expanded, and the nails should extend back into the quarters, as a brace, to stay the heels, the nails should be driven into the wall around the forward arches of the hoofs. The inquiry then arises: What offices do the sole and frog exert as weight bearers?

The sole begins to arch at the anterior points of the bars. In front of the point of the frog the arch is the greatest, and it extends to the wall, above the point of contact of the wall with the ground. The lower anterior face of the coffin bone has precisely the same arch extending from the outside rim to the centre of the semilimar ridge. If pressure was intended of the lower face of the coffin bone upon the sensitive floor of the foot, the bone would not have been fashioned with a sharp lower border, even if the sensitive floor was a thick pad such as protects the feet of the carnivorous animals, instead of being abundantly supplied with ramifications of nerves and blood vessels. Mr. Fleming is undoubtedly correct when he maintains that there is very little pressure, if any, of the pedal bone upon the sensitive sole of the foot. The insensitive sole, from its arch like shape and remarkable strength, therefore, is mainly devoted to preserving the correct shape of the wall; to prevent its encroachments upon the internal structure, on the one hand, and the undue expansion of the wall on the other. Undoubtedly it is

Digitized by Google

designed to subserve the additional purpose of keeping out the dirt and extraneous substances, and to prevent bruises of the sensitive sole; but as a primary weight bearer its shape, position and action clearly proves such can not be its function.

The frog and quarters and sole, thus being slightly elevated above the line of pressure, and being thus clearly secondary, not primary, weight bearers, the inquiry arises: How are they enabled to perform this function?

This leads our investigation into the internal structure. The inside surface of the wall is serrated with leaves of horn that dove-tail into the corresponding leaves of cartilege that grow upon the outer face of the pedal bone, extending to both the outside and inside faces of the bars. Authorities vary as to the number of these sensitive and insensitive laminæ. Some have claimed that the limit is 500, while others that they vary with the size of the foot. But the author with the fine point of a needle has patiently counted them in green feet of different sizes, and, in every instance, they approximate to 700, including those attached to the bars. These sensitive laminæ are exceedingly tenacious, yet have an appreciable expansive capacity. The lowest bone of the foot is suspended by their dove-tailing attachments. The demonstration of this fact was successfully made by the great veterinary authority, Prof. Coleman, of the Royal Veterinary College of London. He removed the entire soles of a horse's front feet, and then caused him to kick up behind with all his power, and to walk, trot and gallop upon a smooth surface, where no wounds to the sensitive sole could take place. The pedal bone, after this violent exercise, was not in the least displaced in its position, but remained as firm as if the sole had not been removed. Moreover, the horse showed no appreciable discomfort from the loss of the sole, but was as free from lameness as if the absence of an insensitive sole was the normal condition of the hoof. If the frog was a primary weight bearer it would become abnormally developed; exceedingly tough in texture, so much so as to crowd upwrd by the pressure of every footfall into the region of the exceedingly delicate, sensitive frog, and materially interfere with the operation of both the flexor tendon and the sensitive frog. Not only are all these injurious results obviated by preserving the frog and sole as secondary weight bearers, but the other resources of the foot to dissipate the resultant concussion are brought into full exercise. Bearing in mind that the pedal bone is suspended by means of the sensitive and insensitive laminæ, and that their attachments are hard and unyielding, the firm wall being the fixed basis of the insensitive laminæ, and the hard coffin bone the support of the sensitive laminæ, just as the bed of the vehicle above, and the axle below afford inflexible attachments to the spring, and insure their perfect elasticity, it follows that if there is any capacity of expansion and elongation of the internal structure of the foot it must be confined to the laminæ. Ingenious experiments have been made by the great French hippopathologist, Mons. Bonley, who affirms that their elasticity is equal to one-quarter of an inch. both in the lateral and the longitudinal directions. Now there are, approximately speaking, 700 of these sensitive laminæ. If each one has an elongating capacity of one-quarter of an inch, when the weight at every footfall in the most violent action is placed upon the ground the strain comes upon the pedal bone, by which it is transferred to the sensitive and insensitive laminæ. These elongate and enable the pedal bone to descend not more than a quarter of an inch. Of course this descent is less in ordinary trotting or cantering, and still less in walking. But if this capacity for elongation is reduced to inches, its extent becomes an object lesson of surprising extent. For instance, there are 700 of these sensitive laminæ; each one has an elongating capacity of one-quarter of an inch; the entire laminæ, therefore, have a combined capacity of 175 inches of extension power. This is absolutely enormous.

But if this concluded the operation of the laminæ, the pedal bone would press so violently upon the sensitive floor of the foot as to cause intense pain. There must be some compensating relief. This is found in the lateral expansive

Digitized by Google

power of the posterior portion of the hoof. When the heels land upon the ground they expand laterally. The limit of this expansion in the normal foot is limited to the lateral expansion of the sensitive laminæ, which was stated to be equal to one-quarter of an inch on each side. This, in violent action, would be equal to one-half an inch of the entire heel. Now it is a law of mechanics, that the descent of the sole would be exactly equal to one-half the lateral expansion of the heels. This descent of one-quarter of an inch would enable the frog to come into contact with the ground. Here then we have the key to the entire mechanical action of the foot. At every footfall the weight comes primarily upon the hard wall and bars at the heels. Simultaneously the heels expand, which enables the frog to touch the ground. The resultant concussion is thus transferred to the sensitive laminæ which dissipate it very largely by their elongation both side wise and downward. Whatever remains is immediately arrested by the insensitive frog. If any still remains it is transmitted into the delicate region of the sensitive frog where it is entirely dissipated, provided always the hoofs are normal in shape and dressed to the proper height of heels and length of toes. Mr. Fleming made his crusade against the accepted theory of the expansion and contraction of the posterior portions of the hoof one of the prominent features of his "Premium Essay on Horse Shoeing." But since that work was published there has been detected so many evidences of this alternate expansion and contraction that objections have now become obsolete. Without this elasticity the friction of every footfall would become intense. It would be the heavy destructive fall of the trip hammer, for it has been estimated that the pressure upon the bottom of each front foot of a horse weighing 1,000 pounds and trotting at the rate of a mile in two minutes and forty seconds is equal to 1,000 pounds to the square inch.

But with the presence of this expansion and elasticity there is an abundant means provided for destroying all resultant concussion. Foot pads and mechanical appliances for spreading the feet are like crutches to a nimble limbed athlete. All external applications to make the wall soft or elastic are worse than useless, for it should be firm and dense to enable the laminated springs to work to their best capacity. Without this base of support, or with considerable elasticity in the wall, direct interference with the action of the laminæ would be thus interposed. Every preparation of the foot for the perfect operation of its various parts, as above indicated, should be carefully observed. Not the least is the formation of the heel of the shoe, for upon this very largely depends the correct angle at which the foot strikes the ground. Many smiths, indeed the majority of them, finish the heels square, being perpendicular. This is not the inclination of the heel. It is always at an obtuse angle, and the heel should observe precisely the same angle, or in other words, a continuation of the same slant that the heel observes. This does not necessarily insure a short shoe at the heels, for whatever may be the elongation the same angle can be preserved.

Nor does the sole require the application of poultices and soothing puddings to soften its texture. It should be firm and as dense as its texture indicates, not as firm as the wall, because the pressure upon it is not so great, but hard and unyielding enough to keep the hard wall to its position, thus insuring ample space for the working of the internal structure of the foot. All that is required is to leave unimpaired the enamel of the wall that prevents the rapid drying out of the natural moisture of the foot, which is an active agency in retaining the proper shape and texture of the wall. Moreover the sole should not be parched upon board floors or heating bedding, for they rob the hoof of its moisture below and induce contraction, which brings in its train all the evils of inflammation. The natural earth, with clean, cool bedding, is the best floor to insure healthful feet.

The writer has known of horses thus shod from colthood to old age that have never taken a lame step, nor suffered from contraction in any of its many forms. Man can not approximate by mechanical appliances to the beautiful

Digitized by Google

arrangements of nature thus indicated for making the footsteps of the horse, either at his leisure or most resolute speed, free from pain and injury; nor can he by hoof-dressings and poultices equal the enamel of the wall and the moisture of the hoof that nature constantly supplies from the earth. All such applications, like the constant use of bandages and liniments on the limbs, weaken and deteriorate the tissues. Instead of invigorating the parts they positively injure them, and many a horse has become prematurily decrepit by these applications of mistaken kindness. The natural law of growth of the hoof is moisture, not in sufficient quantity to weaken the texture, and such friction upon the coronary band which the grasses and the rough growths always produce in the pasture. Rarely are artificial appliances in the domesticated state necessary. Violent exercise may demand temporary remedial appliances, but hours of constriction by means of medicated bandages, and long continued mascerations in the soaking tubs are relics of treatment that have reluctantly been discontinued under the protests of more enlightened science.

THE HORSE FOR PROFIT.

BY RAY MARSHALL.

I.

All breeders of improved stock prefer a profit as the result of their efforts. There are those who have an idea and are determined to realize it, regardless of profit. It is a rare exception, however, that breeders are willing to sacrifice gain in their ideal. In the last decade there has grown up in this country in several states an abnormal interest in heavy, beefy draft horses. It was stimulated by the theory advanced by importers that such horses could be grown and sold without any handling or training, in much the same way that fat steers are produced. For a time western farmers could sell such colts at the ages of two and three years to supply a demand from the farmers of Pennsylvania, New York and eastern Ohio for work horses. In turn the colts thus bought were worked till five or six years of age, and thus matured and hardened as well as trained, so that they could be sold in the cities at a good advance over the cost when procured from the West. The work of such colts amply repaid for keeping them these two or three years, and, besides, the advance in value was usually considered equal to the interest on the investment and a premium on the risk taken of blemishes or possible death of the animal. Year by year this class of horses has increased in numbers, and the farmers of territory farther east have taken up their breeding. As a result, much of this intermediate trade between the western farmer and the city demand has fallen off. With the numbers of such colts trebled, the supply has come to far exceed the demand. It is true, yet, that heavy draft horses of superior quality meet ready and profitable sales. It will be observed, however, that in many cases this superiority is owing to the fact that at least one-fourth of the blood of the animal is contributed through from our high-spirited and good dispositioned American road horse. In brief, it is conclusively shown by the disposition of the buyers who are traveling among the farmers, that the draft horse, pure and simple, as brought from the old country has not the action, bone, muscle and sinew nor the intelligence and endurance demanded in our wide-awake western world. This statement does not apply to the exceptional cases where very superior equines have been brought across the water. Such animals, however, are rarely found among the practical farmers and general breeders for the market. They are too often kept on a fancy farm where there is very limited opportunity to reproduce their kind.

It is further true that the mating of such horses is too often made with very poor judgment; their progeny is contaminated in the first cross; and the future usefulness for breeding purposes is thus more or less impaired at the start. It

Digitized by Google

may be suggested that in this fact lies the greatest obstacle to the production of first-class animals, viz.: The great ignorance among farmers and horse owners as to the numerous little things to be observed in selecting their breeding animals, and in properly mating them. In a word, it is too true that there is not enough uniformity of ideas as to the standard of excellence to be sought after in the breeding business. As an illustration of this it may be stated that a prominent breeder and importer had a few years ago about twenty imported stallions in his barn for sale. Included in the number was one which he wished to reserve for his own use. During the sale season the stable boys were instructed to neglect this one in the matter of high feeding and grooming. When buyers came to the barns this animal was passed by or shown indifferently, as one not in saleable condition. It is a remarkable fact that it required but little tact to reserve this horse, the owner's favorite, and sell off all the others. The strange part of it, too, is that men traveling and seeking breeding sires are presumed to have much more than ordinary judgment in selecting such horses. It is an incident of the business in nearly all sale stables that if a poor horse is to be sold it is a good plan to price it high. If there is a superior horse to be reserved for any reason, neglect and a low price will usually effect the desired result. The above incidents suggest a solution of the condition of the horse market to-day. At least half of the breeding sires, and probably three-fourths of them, have not the merit desirable for their stations. The breeders, particularly those represented by the general farmer, have allowed themselves to be imposed upon. It is true, however, that in many instances the farmers themselves are responsible for the condition of the breeding business in their midst, from the fact that they have too strenuously insisted on having a uniformly low fee for service in all cases, regardless of the merit of the sire in question. This being true, the importers as well as stallion keepers have been forced to supply the quality which the price demanded. So, in turn, the results have been disastrous to all parties concerned. The producer of horses for the market has a surplus of unprofitable stock, for which he finds scarcely any demand. In numerous instances this season in different parts of the country farmers have abandoned on this account the breeding of fully one-half of their mares, and in some cases all of them. Under the circumstances this action is a wise one; provided there is judgment exercised in selecting the better half of one's stock for breeding, and consigning to the working division, forever, those inferior in conformation and because of poor health, blemishes, and impaired disposition.

This state of affairs has demoralized considerably the patronage of the stallion owner. This individual has, in view of past extensive work in a neighborhood, secured a new horse with a view to meeting the demands for a new cross on the three-year-old fillies for the coming season. Not realizing the situation, on the basis of securing the usual number which he would have a right to expect, his service fees have been fixed early in the spring, and of course could not be changed. Realizing but half the returns anticipated, he is now disgusted with the business, and next season will witness an exodus of many of the present keepers of such stock. The importers, too, have their share of trouble, and present indications point to a reduction in the number of imported horses by half at least, possibly nearer three-fourths as compared with the last three years. This fact is, perhaps, a boom to the future wellfare of horse breeding in the United States. With the numbers largely diminished, great improvements in quality may be expected. It is important that the draft-horse interests in our country be kept up to a moderate extent. For the heavy draying of the city, for the logging camps of the woods, for the bonanza farms and other occasional uses, there is need of the work horse of 1,600 to 2,000 pounds weight. However, along with the weight, there must be a symmetrical development of other qualities requisite in the model work horse. It must not be forgotten that development is impossible without a foundation. If one has a filly defective in several respects it would be better not to breed her

Digitized by Google

at all. If deficient in but few points it may be possible by judgment to mate her with a sire that will counteract such weaknesses. When one has found from two or three generations of breeding, as he has thought, with a view to improve disposition and other objectionable qualities in the strain of blood that his end is not realized it is certainly time to call a halt. Where defective disposition is so firmly implanted in the blood that two crosses of the right sort do not materially reduce it, it is in the interest of the breeder's business to discontinue that strain. The sale of two or three such animals is liable to get his establishment the notoriety of turning out ill-natured stock. The seeking after high merit, and constant effort to avoid the production of any undesirable qualities in one's horses, is in the line of establishing a good reputation for one's breeding farm that of itself comes to be worth nearly half as much as the intrinsic value of the animals in one's establishment. In the future this theory will prove as practical for the breeder of draft horses as it has in the past for the breeder of fancy drivers. There is yet a good field for the breeder of high-class draft horses who has been careful as to the merit of his breeding stock and mating of the same. The farmer who to-day owns a brood-mare with three-fourths draft blood on a "native foundation" which represents the desirable qualities as to physiology, anatomy, disposition, style and action, has in such a rare brood mare an almost invaluable possession, worth three times at least her selling value. With proper mating, the produce can be made to pay a large dividend on the value of the dam, service fees and the keeping and feeding of the mare and her progeny.

Several items, small apparently, are to be considered in the ideal by which one should be guided in producing the draft horse for profit. If anyone expects his breeding business to go along without thought or judgment on the part of the proprietor or superintendent, he will find it certainly a disappointment. It is, to say the least, an accident if one's business runs itself successfully. The old saying, "No foot no horse" is first in importance where so much weight is to be sustained. Going upward from this point, the quality of bone in the limbs is of next importance. Any defect by way of permanent blemish is seriously objectionable. Quality of bone in moderate quantity is much to be desired over inferior and abundant amount of this necessary material. One should observe carefully the development of the muscles of the limbs. Many good horsemen fail to look all around the limb and ascertain whether there are strong and plump muscles inside as well as outside. There is a world of meaning in the expression "clean limbs." This it is impossible to describe on the printed page. It represents a score of qualities, the elaboration of which would prove exceedingly tedious. It is akin to beauty in the world, which writers for ages have written volumes about, and still no one has ever defined it. Intricate as is the composition of model limbs, they are important for the too often despised "beefy draft horse." To become familiar with the make-up of perfect limbs, one must have a practical training by which he is made familiar with the desirable qualities, as well as all of the objectionable points which impair the perfection sought. Much, of course, can be learned from reading, and conversation with experts, but there are deficiencies which can never be grasped except by the combined application of one's gaze and hands frequently upon the object of study. There is certainly nothing degrading in one's mastering the details of knowledge in regard to the limbs. In great commercial houses it is often the custom to require the sons of wealthy owners to commence at the very botom to learn the business. There is something inspiring in the speculations as to the outcome in several generations of breeding. The master hand in the breeding business must be guided by a fertile brain. Evolution of this sort of guiding mind must come from the union of quick observation with constant work of the hand in every-day contact with the object of study. On the limbs of the horse should be centered the heavy work of observation and practice. Next should be considered the matter of con-

Google

stitution, akin to which is also the quality of endurance. The determining of these qualities comes largely from working the animal to a period approaching exhaustion. It is, however, not important to carry this to the last limit. The brood-mare or the stallion of the heavy order that is capable of walking four or five consecutive miles at a gait of about five miles per hour, and accomplishes this feat can be counted the possessor of a fair constitution provided there is no evidence of serious weariness attending or following it. The matter of endurance, however, could not be thoroughly established short of a continuous walk with a moderate load, for twenty miles. Such a journey made at the average rate of four miles per hour, ought to indicate, in most instances, superior endurance. Where the animal is able to turn about after two hours' rest and refreshment and repeat the journey in about the same time, no serious exhaustion resulting, the assurance of staying qualities is thus made doubly sure. Of course, in determining of these qualities, allowance must be made for what is known in stable parlance as "soft condition." It would be an unfair test for a horse to give it a twenty miles' walk when it had not been accustomed to walking more than three or four miles daily previously. Such a horse traveled seven miles the first day, twelve miles the second day, twenty miles the third day, should not find such journeys any serious detriment. Such exhibits of powers if against the horse's good qualities would show what is known as "shortness of breath," reluctance to go ahead and weakness generally. Some allowance of course may be made for the disposition to shirk on the part of some horses.

Without going into all the details of the desirable qualities in the profitable draft horse, it will suffice the purpose of this article to say in addition that bone, muscle, flesh and sinew (with only a modicum of fat) are some of the prominent characteristics sought in a casual study of the model animal. Of course when the physical qualities are observed we have still considered but one-fourth the real value of the horse. Three-fourths the value of any work horse or breeding animal lies in its head. The trite phrase "horse sense" has a world of meaning in the study of the equine race. All conceed that instinct, or caution—a common factor in this quality—is not to be dispensed with. Yet there is strong demand for intelligence in addition; which will to some extent furnish reasoning power and judgment. The contact of the draft horse with its fellows and with the busy commerce of the cities, calls for a knowledge superior to that of the average driver. Of many incidental qualities that might be mentioned as desirable, the affectionate disposition to consider and treat kindly living creatures in its way, is of paramount importance. The ponderous animal with such traits would step over a prostrate form on the street carefully without hurting it. The animal devoid of this kindly disposition, would not distinguish between animate flesh and blood and a bundle of rubbish. This season is peculiarly an epoch in the growth of horse breeding. Many are rushing pell mell away from draft-horse breeding. A sensible, far-sighted farmer with a view to profit to himself and to the general welfare of the horse industry will consider seriously the above suggestions as well as the many unmentioned facts which may be inferred from his observations of the situation about his home. Further, he will consider the results that will follow should all at once take up the breeding of road horses and light drivers. The foregoing statements are only suggestions in the direction of advice as to successful rearing of draft-horses. The reading of these words will only remind many of what they already know, and prompt them to perhaps, new and fresh thoughts. The draft-horse breeder will certainly feel from careful review of the situation this season, that there is still room at the top. We would say incidentally that of the general farmers of the country who aim to breed for sale one or two teams per year, not half of them can afford to breed draft horses exclusively. Do the best they will, probably half of them will fail to produce uniformly good animals. With the greatest care in the next ten years probably not more than one draft horse in ten of those put upon the market will bring a top price. Probably

Digitized by Google

two of every five may be average horses. This will leave still one-half of the product below the average in quality. The most successful breeder will be fortunate if half of his youngsters are above the average. Of course it is true that the environments of the broodmare, her work and management, have much to do with the successful realization of results. The small farmer who works his own mares with judgment, if he is a fairly good horseman and continually observes the conditions requisite to the proper development of the maturing fœtus, will succeed better than the one whose work is done mainly by hired men. Next to the small farmer working his own mares the best returns can come from the large breeding farm, where there is systematic attention given to the broodmares and where the general management tends to inculcate the domestic trait in both the dam and her prospective progeny. An incident of such effort at developing this trait is the plan of feeding a little grain two or three times a week to the broodmares and foals. Where they are accustomed to coming up to a feeding place, if but every other day during the grazing season, with the intermediate days utilized for salting, etc., a small amount of grain, oats or oatmeal, with a little wheat bran, will suffice to not only give strength to the development of frame in the youngsters, but will be especially valuable in cultivating an acquaintance with mankind and in effecting a forbearance among themselves of much in the way of accepting knocks and trifling bruises from crowded contact with each other at these times. Of course this will entail, perhaps, an expense of $5 per head on the colts during the six or eight months of the grazing season, but it is evident to anyone that the gentle colts at the end of this time, as compared with a wild condition, resultant from neglect of this training, will have an added value equivalent to two or three times the cost to say the least.

Of course after the colt is two months old everyone expects to feed it preparatory to the time when it shall be weaned, so that it may be able to dispense with the dam's milk and go right along growing without loss of the valuable colt flesh. After the weaning period, and for weeks previously, it is highly important that there be the greatest care given to grain feeding. Until the youngster is eighteen months old it will not have the discretion in selecting the grasses to meet its taste and needs, which comes after this age. The brain of man in the guise of thought and judgment, must provide at this time the bone-developing and muscle-forming ingredients needed in its growth. Very thoughtful attention must at this time be given to cultivating the growing colt's taste for provender—the different kinds of hay, corn fodder, straw, etc. Where there is winter blue grass in abundance care must be exercised that the grain and meal shall not be in excess of the needs of the youngster to the extent of taking away a strong desire for the grazing at this time. In the absence of winter pasturage ensilage, roots and any like cooling food can be used to the best advantage in connection with the right proportion of grain feeding. We think it advisable to provide sheds or stables with stalls for the young colts in groups of not more than four and that up to the time they are eighteen months old they should be haltered and tied up as often as once a week from the age of three months. This brings them usually to the second winter. It is advisable now to halter once every other day at feeding time for an hour or two. The growing strength of the powerful animal requires, as a precaution against wilfullness, that this practice of tying be increased as it grows older. During the following summer it is also desirable that once a week the two-year-olds be brought into the barn, haltered and fed and allowed to remain tied for perhaps six hours. Such systematic handling enables one to observe any bruises or deficiences, any ill shapes that may be taken by the hoofs, and correct the same with knife or other instruments. When winter comes such colts should be tied in their stalls in groups of not more than four, daily, once at feeding time, and more attention should now be given to leading them, which, of course, should have had some attention prior to this time. Leading out to water and tying to a post or tree in the open air once or twice a week for half an hour is

Digitized by Google

valuable during this third winter of the coming horse's life. The result of this will be that much of the risk of breaking the powerful three-year-old will be anticipated. Upon the small farm where there is the work to do, it is usually better if the farmer or an expert hired man works the two-year-old colts at light driving about the farm, to the postoffice and in the light cultivating of the crops. The reason for all this is evident to those upon whom the buyers have called in recent months. The buyer does not want the annoyance of "breaking" the colt; besides, it is now evident to every one that a colt trained from its earliest life is worth three times as much in some respects as one that is "broken" only, and this work never but half completed.

With the right sort of care, something after the plan outlined here, draft colts and coaching horses can be made ready for sale at two and three years of age. The frequent demand among the farmers themselves for a team which they can work a few months and then dispose of at a profit is well worth the precaution of training the youngster as it grows up. Recent experience with a three-year-old draft gelding convinces the writer that $5 worth of time and care per year is the best investment one can make, even on a draft animal. In most cases it will result in selling the animal one year earlier. This of itself, if the breeder has not work for the horse when fairly matured, will repay the cost of this early training in the amount saved from expense of keeping another year. Add to this the risk of death and the interest on the investment, and there is a farther inducement for seeking the earliest practicable sale period.

I have confined this article almost exclusively to profit in the draft horse. There are many farmers who have an average liking for all kinds of stock, with no special preference for the horse. With a view to dividing his breeding business, and not making a specialty of either horses, cattle or any one of the breeds of domestic animals, he can grow two or more colts every year and give them the care outlined above, even if he has no tact as a fancier and fitter of road horses. As has been hinted already in this article, such a breeder of horses is not swelling the supply of drivers and light-weight horses, and is meeting a legitimate demand. Of course it is only anticipated that such colts will sell at three years and four years of age, for from $100 to $200 each, owing to quality. At the minimum price there is profit in this, equal at least to that of growing fat steers or fat hogs. A farmer has the consolation, too, when the scourge takes his pigs, and low markets take his cattle, that he has something in the colt that is for sale at least for cost. There is little to be held out to the breeders of such horses in the line of speculation. He may possibly, by special work in this direction, get some speculative values from the breeding trade, and there is, after long continued breeding, the probability that for breeding purposes a few of one's animals may be sold for fancy prices. Not more than one breeder in fifty of draft horses should expect such results. It would seem that the days of speculation in this breed are nearly at an end. This class of horses may be handled at a profit by every one who observes carefully the conditions requisite to success. The only caution to be observed is, that one avoids swelling a crowd in this line of work. It is not advisable usually to breed the draft horse exclusively. Many men with a special liking for the road horses, find it impossible to care for very many of them. The capacity of their farms may be sufficient to support thirty to fifty head. There will be more or less risk to the man of limited capital in putting all of his means into the one kind. If either kind must be neglected, in the matter of training from want of help to do it, the draft horse will best stand that neglect.

HAILING THE HACKNEYS.

BY R. C. A.

Composition of the Breed.

The "Hackney" a Universal Type.—The Hackney—to make use of a common phrase, whose kind is generally described by a word derived from the name of our

Digitized by Google

subject, viz., "*hackneyed*," which indeed is very useful in indicating the uses of the original—"has come to stay." The animals bearing this title, since the importation commenced, have won their way into the hearts of all lovers of specialized horse forms. Perhaps they constitute, taken altogether, the most distinctive type of animal that has been produced in modern times in all that concerns their conformation, style and action.

Articles in this magazine have dealt with the breed from several standpoints. That we do so again is ample evidence of the interest all American horsemen must have in this breed. American breeders ought indeed to love almost it as "a very brother."

We intend in this article to deal, summarily stated, with the composition of the breed, and also allusively to the homes it has found in America.

The first part of this intention, in itself, has proved particularly interesting.

As indicated in a previous article (September, 1891), the study of the word *hackney* itself discloses the very interesting fact that it is perhaps the most widely distributed word applied to a horse that exists in the whole family of Aryan languages. In fact the word may be taken as indicating the earliest distinctive form of the horse. That form as indicated by the meaning of the word seemed to be universally disseminated. But the existence of the common word, if it does not prove a common origin of the animal, proves the common existence of such a type that so impressed itself on the minds of the people who successively inhabited the various regions of the old world that they applied this similar name to the one similar type, thus also establishing the fact of their own common origin.

Further, that type, so denominated, certainly would never be expected to remain continually, exactly the same. According to distribution and environment it appreciated or depreciated perhaps, till in more modern times, while the average was improved, there were also, too, what might be termed *plus* or *minus* classes—these in relation mainly to size, the early governing distinction. But still these three grades—this used in its proper sense—had still the distinctive features of the horse which had originally received the designation

This Type, Variously, in the Stud Book.—Now the above has a direct interest to the student of Hackney "lines." These various grades we indicate became known to moderns by other names, derived from other ideas had of the horses from which they were taken, than those that originated and spread the primary word.

Thus we find as the foundation of, or entering into the composition of, the Hackney as conceived in its Stud Book, such variously named examples or evidences as *nag, cob, pony, galloway, hack,* besides *trotters*—English or American. These are all actual occurrences in the entries. They represent the grades on the "greater island" of the type originally universally known as *hackney* which is now particularized and demonstrated as entirely and solely a British breed. In Britain the characteristics had been preserved, developed, and accentuated.

The "sister isle," Ireland, does not contribute its original type to the first volume, else we might have had the addition to the above list of grades the *hobby*. There is an instance of an Irish trotter, however.

But the above enumeration gives as good an idea of the foundation composition or character of the hackney breed as anything we can well produce.

The last link in this connection is furnished by "the objects for which the society is established," as set forth in its articles of association, the initiatory one of which is "(*a*) To improve the breed and promote the breeding of hackneys, roadsters, cobs and ponies." As the consideration of horse names is a contemplated subject of treatment by the writer, more minute reference to the above and other similar names is to be deferred.

Other Blood Indicated.—The blood of the animals mentioned was of the home breed, on the dam or foundation side. Infused into that was what may be regarded as giving all its determinative cast. We refer here to the *hunting, thoroughbred* and *oriental* blood.

Digitized by Google

The hunting (partly thoroughbred) blood was introduced, also, by means of the dams. These may be regarded as high grades (American usage) of the thoroughbred. The thoroughbred and oriental were introduced by the use of such sires directly, or by direct lineal succession.

The above indicates the general composition of the modern hackney—in fact it is a summary of the breeding exhibited in the first volume of the Stud Book. We have made the above review as a first step, because American horsemen will find that they have a *direct interest* in the contents of this first volume, which is our next step and object to show.

The Hackney Stud Book.—In August, 1878, at a "Royal of England" show, an attempt was made to establish a "Trotting Horse Register" for roadsters, cobs, ponies and hackneys. The first object of this promotion was to put on record as far as possible all that was known about horses that had traveled in Norfolk, Yorkshire, and other counties, or had been exhibited at the local and royal shows. "This would establish pedigrees once for all." The next thing it was desirable to have in the register was "as complete a record as possible of really good hackney mares of known breeding."

At this meeting a report says Mr. J. H. Wallace of New York was present and stated that "in 1822 Mr. J. Booth of Boston, imported Bellfounder, a Norfolk trotting horse, bred by a Mr. Farrar. It was part of his business in England to trace the pedigree of Bellfounder, as he was imported with an impossible and fictitious pedigree. Bellfounder's blood mingled kindly with old Messenger's blood and that of the whole trotting family. The Hambletonians were out of a mare by Bellfounder. Bellfounder was just such a horse as he saw at Downham, in the class for roadster stallions under fifteen hands, two inches. When he saw that class he thought he must be in New England, where they had a family of horses called Morgans, all trotters with high action, stylish heads and tails, not so fast as the trotters of the Messenger blood, but they mingled kindly with it, and gave it substance and compactness. The Morgans were exceedingly gentle and kind." The above is an interesting little report and speech. It has a distinct value in the connection in which we are writing.

At length in May, 1884, was issued the first volume of "The Hackney Stud Book," of Great Britain, containing a list of stallions from A. D. 1755, to A. D. 1881. Part of this volume consists of an *appendix*, being "A Record of Stallions either sired by thoroughbred stallions and out of Hackney mares; or the produce of thoroughbred mares by Hackney stallions; or, Hackney stallions bred beyond the United Kingdom." It contained 880 entries of stallions in the main volume and sixty-eight in the *appendix*.

Interest of Americans in the Hackney Stud Book.—Shepherd F. Knapp.—In the year 1857 there was foaled in America a horse that received the name Shepherd F. Knapp. The breeder was George Snell, Turner, Maine. Shepherd F. Knapp was a chestnut. His sire was The Eaton Horse, by The Avery Horse; his dam was by Whalebone (The Clark Horse), by Sherman, son of Justin Morgan.

By virtue of his several qualifications for the same, in that *appendix*, at page 371, appears the name and pedigree, etc., of this American bred Shepherd F. Knapp, attached to whose entry therein is the conspicuous statement: "Imported into England."

Shepherd F. Knapp is therein stated to be the sire of:

Goldfinder (Lewell's) 318; dam by Goldfinder (Palmer's) 316.

The Great American 332; dam a Shales mare.

Knapp (Conchar's) 399; dam by Phenomenon (Ramsdale's) 573.

Shepherd F. Knapp (Ringer's) 762; dam by Norfolk Nag (Gower's) 518.

Besides the above given in the appendix he was, according to entries in the main part of the volume, the sire of:

Washington 852; dam by Nonpareil (Gardner's) 474.

Rapid Roan (Grout's) 660; dam by Rapid Roan, *ppendix*.

[*Norfolk Shepherd*, not entered separately, but given as the sire of Jerry (Murrell's) 337.]

Digitized by Google

Primrose, dam of Rising Star 672, and Star in the East 768.

Washington was sire of:

Adonis (Applegate's) 12.

Fireaway (Bower's) 266.

Model 2d (Gregg's) 460.

Dam of Canvasser (Cooke's) 114.

Goldfinder (Lewell's) 318 was sire of: Goldfinder 3d (Lewell's), 319.

So that Shepherd F. Knapp was, in this first volume of the Hackney Stud Book of Great Britain, directly responsible for sixteen animals.

That this Shepherd F. Knapp blood was mingling with the best, as the best, is seen by some of the records. Goldfinder (Lewell's), his son, took first prize and special at the Norfolk Agricultural Society in 1880.

Star of the East 798, sire of Rising Star 672 and Star in the East, 800, both out of dams by Shepherd F. Knapp, must have been one of the most successful show sires of the breed. The total sum won by him from 1876 to 1883, inclusive, was $5,000, besides gold and silver medals.

Rising Star won five first premiums at important shows. His grandam Nelly, won no fewer than twenty-eight firsts at Royal of England, Great Yorkshire and other shows. Star in the East is, as will be observed, full brother to Rising Star.

Washington traces to the venerated Marshland Shales 435, and Wroot's Pretender 596, Knapp's dam was sired by Phenomenon (Ramsdale's) 573.

In the earlier volumes of Wallace's Register we learn that the dam of Shepherd F. Knapp was "a pacing mare," that he passed from his breeder, through the hands of Silas Mitchell, Russel Bros. and others, to H. W. Genet, of New York, then to Mr. Senter, by whom he was taken to England "where he was kept a number of years at the stud," and also "engaged in some races there." His number in Vol. IV is 282.

In the same volume we are informed that the dam of his sire "The Eaton Horse," 122, is known as the Bullers' Mare of Anson, by Winthrop's Messenger. Besides what we may really call "the great" Shepherd F. Knapp, The Eaton Horse had to his credit Stranger, 30, and Village Girl, 2:28.

Shepherd F. Knapp's grandam "was a mare brought from New Hampshire to Maine, not traced."

Mr. Wallace states in Vol. III that "the pedigree given to him in England was entirely ficticious." This refers to the pedigree given at date of his exploits there; not to that in the *appendix* to the Hackney Stud Book, which corresponds exactly with the particulars in "Wallace's Register."

It will be seen that through the Eaton Horse 122, and Whalebone 943, Shepherd F. Knapp actually traced to the "father of the Hackneys" in England, and also to "the father of the Morgans" in America. So that on both sides this horse was descended from the best stepping blood on each side of the Atlantic, the Morgan horse being a bit of a high stepper himself; as Black Hawk's (Vermont) "stock were uniformly stylish and *trappy* drivers," and were usually fast, some of them among the fastest. These little facts have considerable interest.

Hiram Woodruff, in chapter 4, of his classic work, says:

"Shepherd F. Knapp and Jessie were another pair that were trained early, and with no ill effect, even though their race was one of uncommon severity. They were four-year-olds, and trotted five heats, the best of which was two minutes and forty seconds. It was the second heat, and was won by the filly after she had previously won the first. Upon seeing the time of this heat, I concluded that the colt could beat her, and he won in two minutes forty-one seconds. But though in view of his recent doings in France, it can not be said his severe race did the colt any permanent injury, it would be too much to affirm it did him any good. Next year, while in training for his match with Henry Clay he continually hit himself in the elbows, by reason of excessive knee action as it appears, and thus prevented the bringing him up to the mark. This horse recently trotted two miles and a half in France in six minutes and fourteen seconds, which is a trifle better than the rate of two-thirty to the mile."

Further on, in the same volume, Woodruff gives a little anecdote and makes

Digitized by Google

some remarks anent the Bush Messengers:

"This Bush, or Maine Messenger line was another very good ramification of the Messenger blood, and of great value in Maine and Massachusetts. The horse got a large number of fine trotters and some first rate ones. The latter were nearly all chestnuts. I mentioned this fact to a friend who comes here to 'talk horse,' and, said he: 'Now here's a glorious confirmation of the old maxim, Like produces like, *or the likeness of some ancestor!* The Gray Messengers take after Mambrino, old Messenger's son; those chestnut Bush Messenger's, take after Blaze and Flying Childers, the sire and grandsire of Sampson, who got Engineer, Mambrino's sire. Now, here you see, Hiram, is a proof.'

"'Stop!' says I. 'What you say is all very fine, but I think it just as likely that the Bush Messenger's dam was a chestnut, as that his colts were thrown back to Flying Childers.'

"The Eaton horse, in Maine, is a near descendant of the Bush Messenger, and he has kept up the line of trotters. Shepherd F. Knapp is one of his colts."

"At the meeting of the Yorkshire Agricultural Society, at Beverley, a prize was awarded to Shepherd F. Knapp, whose action was as beautiful as anything ever seen in this country, his hind legs following or pushing on his forequarters outside his forearms. For pace no English roadster could touch him. He was not a roadster sire according to Norfolk, Suffolk or Yorkshire trotting authorities, in fact, he was nearly thoroughbred. Major Stapylton, of Myton Hall, Yorkshire so well known some years ago as a breeder of high-class horses of every kind, race horses, hunters and harness horses, in Yorkshire and in town, and of the stamp of horses he drove in his four-in-hand coach and other carriages, writes thus about Shepherd F. Knapp: 'He is, according to the American pedigree, out of an Arab mare, by Ethan Allen, by Morgan Black Hawk, by Sherman; Morgan Howard's mare, by a son of Hambletonian, his dam said to be by Imp. Messenger, a thoroughbred horse, by Mambrino. His produce out of thoroughbred mares in the course of four years showing more the shape of the dams than the horse, with good size, have obtained the points so often wanting in so many of our hunter and trotting horses, capital legs and shoulders, with action and constitution. With half-bred mares his power is still more shown. They have invariably followed the horse in shape and action, getting the Arab head and fine temper. As yearlings and two-year-olds they have fetched high prices."' The above is extracted from Sidney's Book of the Horse. In so far as it deals with the horse individually, and as a sire, and coming from a high British authority it is valuable. We acknowledge it as a worthy tribute to a worthy horse. It is not to be wondered at that the pedigree of the horse as given does not altogether correspond to the American authority.

The remarks of Mr. Woodruff and Major Stapylton would indicate that Shepherd F. Knapp, if he lived to-day, in such form, would be a very czar among Hackneys; his dash and step would create a furor and electric sensation.

Shepherd F. Knapp was truly a great horse. He was a Hackney—a splendid one. Being bred in America simply emphasizes that fact. His breeding, manner of production, proved his American creators quite as adept as the English fraternity. The materials were the same and equally as good. The credit belongs not so much to the materials in such a case as to the skill of the users who originate therefrom and the insight required to secure the best results. As a Hackney, Shepherd F. Knapp was evidently *facile princeps.*

It must be particularly gratifying to know that the blood of Shepherd F. Knapp is preserved in the best of shape in England to-day. It is in the best of condition for being perpetuated. It is to be found very largely in what may, from many points of view, be considered as the most representative stud in England—that of Mr. Burdette-Coutts at Brookfield, within hail of Bow Bells. In the superb catalogue of this stud—more a history of the breed—we find many worthy successors of and many appreciative allusions to the great American. Of his daughter, 288 Primrose,

Digitized by Google

is therein said: "The breeding of his mare affords a much more interesting study than we can afford space for." p. 69). "Old as she is, there is hardly more striking combination of quality hape and action in the stud than is to e found in Old Primrose." She "will lways be identified with 495 Polly as lternating for many seasons with each ther in taking the principal prizes in Yorkshire." Old Primrose has a large amily at Brookfield—some bought for, nost bred in, the stud.

The Knapp blood comes in for further note in alluding to the First Old Belle "a rare good one" as dam of Washington, Dividend the dam of Goldfinder, 318, son of Shepherd F. Knapp, and others.

Washington, again, is in England, it is pointed out, the sire of the famous Movement. Altogether it is a happy incident that there has been shown so great an appreciation of this strain of Shepherd F. Knapp, whom Mr. Coutts describes as "the brilliant American sire who left so many traces of his excellence both in Norfolk and Yorkshire."

Mr. Burdette-Coutts is a student and lover of the American trotter, for he sees in it a good deal of the real Hackney. Visiting an establishment where was a noted horse of the Clay family he exclaimed: "Why he's a Hackney!" On seeing his action he remarked: "He has too much stride behind; we don't want the speed, but the high, graceful knee action in front." These are such remarks that have doubtless been made of many an American, which shows that had the fancy for "fighting the air" instead of fighting time, been suggested as of marketable value, the call might have been easily catered to, in this country itself. There are many still being bred of the highly eligible Shepherd F. Knapp type.

Other American horses in Stud Book.—But his is by no means the only American blood in the first volume. We have, besides the great horse the following:

Firefly (Houldsworth's) 273, foaled 1876, bred in Essex, had for dam a daughter of "Morgan Lightfoot (*American*)."

Rifle 669, foaled 1871, owned by his grace the duke of Devonshire, was sired by "Cannon, by Cambridge Chief (*American*), by Vermont Black Hawk, by Sherman Morgan." Cambridge Chief, it is stated in a note, in 1863, stood at Garner's livery stables, Liverpool. He was then nine years old, fifteen hands, jet black. His dam was a Black Mare, sired by Flying Morgan, and from a Hambletonian mare, reported to trot a a mile in 2:38.

Railway 654, foaled 1836, had for his grandam "Theobald's American grey trotting mare." His dam, by Sir Peter, daughter of Theobald's mare, trotted a mile in 2:40, beating the duke of Grafton's mare, and was afterward sold for export to France.

Marksman (*Appendix*), foaled 1873, brown, sixteen hands, *sire* White Eye, *dam* by Lexington, *g. d.* a trotting mare bred in New York. His breeder was James Wadsworth, Lake Forest, Ill., and he is or was owned by William Morris, Aberdeen, Scotland. Marksman won four first prizes and two silver medals at the Royal Northern Agricultural Society's shows, at Aberdeen.

American Horses Imported into England.—In addition to "the useful hackneys" bred in America, as entered in the Hackney Stud Book, Vol. I, Woodruff mentions the following trotters that "went to England" in former times: Rattler, "the best American trotter that ever trotted in England;" Oneida Chief, a chestnut pacer; Ajax; Sir William, chestnut; Confidence (Mr. Osbaldeston's, "The Old Squire"), bay; and Lady Slipper, white. Beside these, were Tom Thumb and Rochester. With the incomparable Shepherd F. Knapp, the above list, doubtless, included the best. But they by no means represent the whole American contribution to British horse stock. It may be said that, at the latest, from Youatt's time onward, there has been an increasing importation into Britain, from America, of American trotters. Deep down in the Britisher's heart is an innate love for "a trotter;" and, as Hiram Woodruff remarked of, if I forget not, Mr. Osbaldeston, who had the passion more fully developed than usual (which he attributed to his sojourn for a time in Amer-

Digitized by Google

ica), he had to have the best, and when he wanted the best he knew of only one place to get them—America. So the American trotter was really the only recognizable trotter in Britain. Indeed we might almost say that every horse that could trot was "an American." He could not be sold so well without that title.

As indicated by Sidney, large and constant importations of American horses took place frequently, to fill positions of what really were, to them, *drudgery*. We use this word advisedly, for this is the accepted definition of the word Hackney, itself, in the introduction to the Stud Book. There, Mr. Euren quotes long definitions from William Taplin's "Sporting Dictionary," to indicate the difference between a "hack" and a "hackney." Taplin, in this very interesting description, proves the subserviency of the Hackney in the province of "all *drudgery* and *labour*."

"I closely examined," says Sidney, "a number of American horses which were imported in 1878 for use in the North London tram cars. They were nearly all remarkable for quality and action, with neat heads, and tails stylishly set on. They had courage, and were very good tempered. The defect of the inferior sort was being too long in the leg and too much split up behind. They have remarkably good constitutions. They were far superior to anything imported from the continent of Europe. The Americans are the only people besides ourselves that have sires with quality, size and action. Their stallions are more sound and have better trotting action than average English blood horses. The prices given for a pair of American trotters far exceeded anything paid for the finest steppers in London or Paris."

Certainly, comparatively the tramhorse might be called a *drudge*. But we know for a fact that there were often among those impressed drudges many a horse of "mettle, spirit, shape, color, marks and the like," that frequently came under the observer of horse conformation and were, as a result, promoted from the slavery of the tram or van, to the dignity of the saddle, or dog-cart. Such, in truth, was the history of a "black pony" that might have honored the name of Morgan—that became "famous" in the Highland home of the writer. The clatter of this pony's —she was a mare—ironed hoofs on the hard roads of a frosty night or morning echo in the brain yet. She made "the welkin ring"—every household along the road knew the clatter—there was no interval distinguishable between the sounds, it was continuous—of "the famous black pony." She had a most peculiar disposition; she would "go" only with two, and it was our earliest pride that "we were that" one besides her groom who could ride her. There were others such as she, scattered over the tight little isle. And there is no doubt that such blood, during all these years has been utilized, absorbed in the great gulf of Hackney original sources. As "imitation is the sincerest flattery," we find, further, that there are such names as Tom Thumb, Rattler, Confidence, Rochester, in the Hackney Stud Book, which might be advanced as at any rate proving the impression made on the mind of Johnny Bull by Uncle Sam's product of horse-flesh.

As recorded in the "Notes and News" columns of the July MONTHLY, the duke of Marlborough has two American stallions, Malta and Handsome Boy, at stud at Blenheim, for the purpose of service on Hackney mares, the belief being "they can not fail in making a strong impression" their action being described "as everything that a fastidious Londoner could desire." Besides these stallions, Tuxedo, Lyle, Woodford, are also American horses advertized in Britain at stud this season. Their produce will be Hackneys. But they will likely be debarred from entry in the next volumes of the Stud Book, because their sires are higher bred, *i. e.* too many crosses of registered foreign blood than the authorities will recognize! But doubtless means will be otherwise taken to protect the breeders of this class of stock in the future.

Having made an effort to show the American interest in the first volume of the Hackney Stud Book, that interest should whet our appetite and entice us into an examination of the blood lines of these Hackney breeds—our third object.

The Blood Royal of the Hackneys.—Old Shales or "Shield's," The Original,

Digitized by Google

was a son of Blaze, "thus showing the lineal descent of the Hackney from pure Arabian blood." Old Shales, the father of the Hackneys, was the sire of Scot Shales 692, and Driver 187, the only two of The Original's progeny to whom Hackney records trace.

Scot Shales was famous for getting "good stock out of common mares." His name as sire was always "sufficient recommendation for the horse." Thompson's Shales 700, and Roper's Shales 701, were good sons of Scot. The more famous sons were Hue and Cry 373, and Thistleton Shales 702. Both these were subjects of the writers of the time. Thistleton's Shales was the sire of Marshland Shales 435, foaled 1802, whose dam was by Hue and Cry 373. "He trotted seventeen miles in fifty-eight minutes, carrying twelve stone." This feat made him ever famous. Marshland Shales is held in the greatest veneration by Hackney breeders. A splendid tribute to him is quoted by every historian for which, in full, the reader must consult Euren's most valuable introduction. We can not resist the temptation of reproducing the last sentence of the beautiful tribute: "Amain, I did for the horse what I would neither for earl or baron—doffed my hat; yes, I doffed my hat to the wondrous horse, the fast trotter, the best in mother England; and I, too, drew a deep *ah?* and repeated the words of the old fellows around: 'Such a horse as this we shall never see again; a pity that he is so old.'"

He died at the ripe age of thirty-three years. Of his sons Chadd's Black Shales 83, "the champion of England," Chadd's Shales 704, are celebrated. Norfolk Cob (Wright and Goold's) 475, whose sire was the famous Fireaway 208, had for sire of his dam the great Marshland Shales. The Norfolk Cob was in turn sire of The Norfolk Phenomenon, and both sire and son were celebrated. Here we must leave the line of Scot Shales.

Driver's claim on posterity rests on his only famous son, Jenkinson's Fireaway 201, foaled about 1780. He got so much good stock that his name is found in many pedigrees. He is reported to have trotted two miles in five minutes, and to have been afterward sold for 1,000 guineas. Through Wroot's Pretender 596, he greatly influenced the stock of Norfolk, Lincoln, Yorkshire and North of England generally. Wroot's Pretender was in turn the sire of Ramsdale's Performer 547, who was the sire of Black Rattler 82, and Lund's Merryleg's 449, two of the great sires in this strain of Yorkshire Hackneys. Another strain of even more importance came through the same Jenkinson channel, viz.: West's Fireaway (203), grandsire of the Norfolk Cob, already mentioned.

Norfolk Phenomenon, son of the last, like the sire, combined the other line of Scot Shales; he traveled from Norfolk to Edinburgh where he died in 1850 (*circa*). Anything tracing to him is "priceless." "Nine-tenths of the prize Hackneys of the present day owe their prominence to him." Particularly is this so when combined with that of his near relative, Ramsdale's Performer 547. From this we have Triffitt's, the very great Fireaway 249; as well as Lord Derby 419, inbred to Norfolk Phenomenon, and on the other hand we have Denmark, 177—another "the great,"—inbred to Ramsdale's Performer. Mr. Alex. Morton asserts that it is with these two strains in combination that "we generally see the red tickets carried off at the shows." Bond's Norfolk Phenomenon, is a progenitor of all the leading sires of the day; such as Confidence 158; Norfolk Gentleman 492; Great Shot 329. When these are mated with such strains as Yorkshire has in the Ramsdale Performer order, there are produced such as Edgmont, Star of Mepal, now in America, and Field Marshall, known to show fame. Of them all, i. e. "the great" sires, perhaps Triffit's Fireaway trips off the tongue of breeders more frequently than that of any other recent sire.

The above notes, if they prove anything, prove the potency of similar blood judiciously mingled and blended into close lines.

Next, our fourth object, we shall trace the intermingling relationship of the American and English trotter and Hackney. Such information, though of an elementary character, has at times to come in for repetition as a sort of creed.

Sampson and Bellfounder.—Another

Digitized by Google

son of Blaze, who was so responsible for the Hackney of the day, was Sampson, by steps from whom through Mambrino and Messenger we come to Rysdyk's Hambletonian. Mambrino, "the racer and trotter," was the sire of Messenger, "the ancestor of American trotters," from which source Rysdyk's Hambletonian sprang. Now in the pedigree of the latter the sire Bellfounder is close up on the dam's side. And Bellfounder, the once difficult to trace, *traces from Scot Shales and Driver themselves, on either side.* So that here we have at a glance the lines of connection between the two great similar and dissimilar—in breeding, origin, and physical result—breeds of America and England. Bellfounder, the American, "imported by James Booth, of Boston, July 11, 1822," appears in the first volume of the Hackney Stud Book. He was foaled in 1816, was bay in color, and stood fifteen hands high. *He was bred by* Roger Jary, Ashill and Harling, Norfolk. Bellfounder (Jary's) 55, then as his title is therein, was sired by Steven's Bellfounder 52, by Pretender (Wroot's) 596, by Fireaway (Jenkinson's) 201, by Driver 187, etc. His dam was Velocity (Jary's) *g. d.* a Yorkshire mare. The above will indicate his position in regard to the original Shales and Sampson, both sons of Blaze, all as established by the Hackney records. (*To be continued.*)

American Boy and Williamson's Belmont.

AMERICAN BOY was a fine race horse and finely bred. He was by Van Mater's Sea Gull, son of Imp. Expedition, dam sister to Boxer, by Imp. Expedition. I was always taught to believe that the tendency to trot came from Expedition. My father was familiar with Expedition and Messenger, and both horses in their time stood at my grandfather's stable, and he was familiar with both and always said that Expedition was the finest horse of the two and a horse of the prettiest action, that the only advantage the Messengers had was that they were not quite as nervous. Messenger, though a very correctly formed horse, was on the plain order.

Before American Boy was brought West he got the horse Awful that was one of the most celebrated trotting horses East. Awful beat Lady Suffolk at two-mile heats; also Dutchman in a three-in-five race at mile-heats, and at one time was called the phenomenon. After coming to Ohio he (American Boy) got what was called the Keith horse, that beat all of the horses that he met, making a campaign from Cincinnati to New Orleans and back, trotting seven or eight races during the trip, and won them all.

I saw this horse at Mr. George Crean's stable, in Cincinnati, after his return, and Confidence was also there, just having returned from his eastern trip, where he had been trotting a number of races with Ripton, Americus and Lady Suffolk. Mr. Crean offered to match the Keith horse against Confidence for a purse of $5,000 a side, either at mile heats or two-mile heats, which was declined by the owner of Confidence.

There was one remarkable thing about American Boy. He lived to be twenty-three years old, and he never got a sorrel colt in all of his stud service. His colts were uniformly bay or brown with a strong family resemblance in all, and I never saw one that was a not good roadster. I believe that had horses been trained to trot in that day as they are now that he would have been celebrated as *the* sire of trotters.

Belmont inherited all of the trotting qualities of his sire and transmitted those qualities to his colts; besides they were superior as farm horses. The dam of Belle Echo was worked in this neighborhood until she became old and was sold to go to Los Angeles. If Langford had been broken to harness and trained to trot he would have become as celebrated as a trotting horse as he did a race horse. He could trot very fast when he was in training. Owen Dale, Bonnie Belle, Dashaway and Musidora could all trot fast. The only thing they wanted to make them trotters was the education at that gait, instead of training them as race-horses. Ida May could trot as fast as any of them, and a daughter of hers, by Owen Dale, produced Lady Ellen, and she was a good trotter and has proved an extraordinary good broodmare. She has three or four in the list and more coming.—*W. M. Williamson, in "California Breeder & Sportsman."*

WALLACE'S MONTHLY.

AMERICAN TROTTING REGISTER ASS'N, Publishers.

CHICAGO, AUGUST, 1892.

Office: RIALTO BLD'G, CHICAGO, ILL.

TERMS:

THE MONTHLY.—The subscription price of this magazine is $2 per annum, payable in advance, and never less to single subscribers. Single numbers, 20 cents.

Ten dollars in one remittance will secure six copies for a year, five of which must go to strictly *new* subscribers. This is a gratuitous copy to the man getting up the club, and not a reduction of the price to the members of the club.

Subscription agents and postmasters will be allowed a commission of 30 cents on each new subscriber, and 15 cents on each renewal.

Let it be understood that there is no reduction on clubs or parts of clubs of less than six.

THE YEAR-BOOK.—Notwithstanding the increased size and cost of the Year-Book for 1891, there will be no change in the price.

Single copies at the office or post paid.....$ 2.50
Six copies in one order, at the office..... 12.00
1886, '88, '89 and 1890, in one order..... 6.00

The Year-Book for 1891 contains 1,000 pages. These prices will be strictly maintained in all cases.

THE TROTTING REGISTER.—Vols. 1 and 2 are out of print.

Volumes 3, 4, 5, 6, 7, 8, 9 and 10, each.....$ 5.00
All in one order..... 35.00

The Developed Broodmares.

OF late years so many trotters that have entered the 2:30 list have had for their dams mares with records of 2:30 or better that the question of the value of developed blood in the female line of a pedigree has become one of considerable importance. It is only during the last few years that there has been any considerable number of new 2:30 or better performers from dams that were also standard by performance, because in the earlier stages of building up the type of horse now known the world over as the American trotter, there were necessarily only comparatively few that made records of 2:30 or better, so that when from the entire 2:30 list was taken the stallions and geldings, the mares were not anything like as great in number, up to ten years ago, as would have been imagined. Of course an attempt was made to breed the most of them, but it should not be forgotten that in the days referred to a horse capable of trotting in 2:30 was valuable for campaigning purposes, whereas now with the ability to go no faster than that, he would be absolutely valueless, no matter how obscure the meeting at which it was sought to trot such horse, because at the present time the production of 2:25 and better trotters is so great each season that the 2:30 horse is practically of no account so far as winning races is concerned.

The present has been not inaptly termed "the broodmare epoch" by a distinguished writer on turf affairs, and therefore some facts in regard to what the developed mares have done and are doing, will be of interest and value. An examination of the Year Book for 1891 has been made with a view to ascertaining how many trotters in the 2:30 list to the close of last season were from dams with records of 2:40 or better, it being assumed that, all things considered, it is fair to call a 2:40 clip developed speed. It is not claimed that there are no errors in the list which is the result of this search through the records, but it is practically correct, and is given below. It will be found that 201 trotters with records of 2:30 or better are from mares with records of 2:40 or better, and that 133 of these mares have records of 2:30 or better. Going a little further we find that fifteen of them have records of 2:20 or better, and that these fifteen have produced nineteen 2:30 or better trotters, four of them—Adelaide, 2:19¾, May Queen, 2:20; Lucille Golddust, 2:16¼, and So So, 2:17¼, having given the trotting turf two performers apiece. And right here it is worthy of note that these four mares were all great campaigners in their day. It would take a good deal of space to show in detail what each of these mares did in the way of trotting, but a careful review of records is summarized in the following table:

Name.	*Years on turf.*	*Races trotted.*
Adelaide.....	7	70
May Queen.....	3	11
Lucille Golddust.....	8	38
So So.....	6	14

It appears that these mares average six years apiece on the turf, and that their average of races trotted is a trifle over thirty-three, so that to those who argue that the producing qualities of mares are necessarily rendered less potent by campaigning this showing will be something of a surprise. It may also be mentioned incidentally in this connection that other celebrated campaigners, such as Goldsmith Maid, Lucy and Lady Thorn, have pro-

Digitized by Google

duced daughters and sons that in turn have thrown a great average of standard speed.

Looking at the list in another light, it is seen that a good many record breakers at early ages have also shown themselves great producers. In this list, for instance, is found Galatea, a four-year-old champion in her day; So So, the greatest two-year-old of her time; Sweetheart, the first two-year-old to beat 2:30; Wildflower, who lowered the two-year-old record to 2:21; Elvira, who held the four-year-old championship with 2:18½ to her credit; Sallie Benton, whose four-year-old record of 2:17¾ was the best on the books when it was made, and Lady Maud, who was the greatest five-year-old of her day. The dam of the record-breaking Wildflower also appears in the list and has a record within a fraction of a second of 2:30. Lady Maud, the best five-year-old of her time produced in Monbars, 2:16½, the second fastest two-year-old trotter that the world has ever seen, and perhaps the best race nag of his age. The old pacer, Pocahontas, that was a famous mare in her day, the acknowledged champion of the side-wheel gait, is also represented in the list, and Belle Brasfield, 2:20, is another campaigner that has attained a place among producing mares. All these facts point to a conclusion—a conclusion by the way which is almost irresistible—that, other things being equal, a mare which has more than average speed at the trot is more liable to produce trotting speed than a mare of only ordinary qualities in harness. It will hardly be denied that Beautiful Bells is about as great a producer, age considered, as the world has seen, and it is worth noting that she has a record a trifle better than 2:30. Then again as showing that pacing mares are not entirely out of it when the test is that of production, it may be said that in addition to Pocahontas, two other well-known pacing mares, Mattie Hunter, 2:12¾, and Lucy, 2:14, also appear in the list.

In the matter of producing foals that come to their speed early, the developed mares are also well to the front, as shown by the following names of horses which made creditable records early in life, the names of their dams and their records being also given:

Name.	*Record.*	*Dam.*	*Record.*
Adelaide McGregor (2)	2:29¾	Adelaide	2:18

Dash Races for Trotters.

THE question of whether or not dash races should be given for trotters and pacers is one that has at various times been more or less discussed by horsemen and managers of trotting tracks, and on two or three occasions spasmodic attempts to give the idea a fair trial have been made. The most noteworthy moves in this direction are to be credited to the association which controls the Detroit track and the Northwestern Association of Trotting Horse Breeders. At trotting meetings given by each of these organizations there have been placed on the program a number of dash events for various classes of horses, but they were so much handicapped in various ways that the full measure of their capabilities for attracting and amusing the public could not be fairly judged. At the Northwestern Breeders meeting in this city last summer it was an open secret that several of the officials who had the active management of affairs were

Digitized by Google

rabidly opposed to the dash system as applied to trotters, and under such circumstances it was hardly to be expected that the experiment would be fairly conducted. Nevertheless, enough was seen of how the idea worked in actual practice to convince a good many men that in the near future events would so shape themselves that dash trotting would to a greater or less extent force itself to the front and demand recognition from the more prominent trotting tracks.

It is idle to assert that the present stereotyped program of trotting meetings—mile heats in harness, three in five—commends itself to the public, and this is evidenced by the fact that at all great centers of population in this country where running meetings have been established and conducted in an honest and enterprising manner they have been a tremendous success financially, the benefit of which success is shared alike by horsemen and track management, while in the same localities trotting, which is distinctively an American pastime and in itself of far more interest than running races possibly can be, has languished and practically died out. It is of no use to try to force upon the American public a style of racing which it does not like when something which commends itself to that same public is provided by other people. The trouble with trotting track managers is that they are jogging along in precisely the same rut which their grandfathers occupied, and it is only within the last two or three years that any headway has been made in the important item of reducing entrance fees and providing future events of much value in which trotting-bred youngsters can be nominated before they have worn harness and their selling value as yearlings greatly enhanced. It seems strange, almost incredible, that the managers of trotting tracks, who are almost without exception men of enterprise and forethought, should with the living example of the running turf and its financial success before them, adhere tenaciously to customs which bind them to a mossback line of action. On the running turf there are not only races for horses of different ages, but there are events at all distances from half a mile to a mile and a half, and a crack three-year-old race horse is capable of winning more money in a single season than a trotter under the system which is just now beginning to die out, could get a chance to try for.

What the trotting turf wants is variety, and, in the opinion of many, the first step in this direction will be the introduction of dash races as a prominent and permanent feature of our great trotting meetings. The public goes to running races, not because it prefers to witness horses galloping under the saddle instead of trotting in harness but because it is treated to a number of complete events, five or six, in the course of an afternoon and then sent home in time for supper, whereas at trotting meetings it is not infrequently the case that one race will drag along through an entire afternoon, and in many instances its finish has to be postponed until the following day. The American people, when they patronize an out-door sport which has for one of its adjuncts the betting ring, demands that it shall be given quick action for its money. The people of this country are naturally of a speculative turn of mind, and it follows inevitably that they are averse to betting on a contest where their money is certain to be locked up for an entire afternoon, and where a horse must win three heats in order to be declared the victor. More than this, they naturally turn to that form of racing which by its continually changing conditions gives to each event a dash of uncertainty. If all the races on running tracks were mile heats three in five, if every horse carried exactly the same weight, and if the other accessories of the sport were precisely the same on every occasion, does anybody suppose that at each of the leading tracks there would be from fifty to seventy-five bookmakers paying $100 a day a piece for the privilege of pursuing their calling—in fact furnishing in advance all the money that is offered in stakes and purses? Is it reasonable to suppose that with stereotyped conditions such as have thus far been inseparable from the trotting races the public would flock to the running tracks and crowd the enormous betting rings every half hour or so when a race is to be decided? Under the present system of the American running turf the people who attend races are enabled to bet their money over and over again, whereas at a trotting meeting a man with limited capital that starts in to play the first race must go into the grand stand and sit all the afternoon before he knows whether or not he is going to win. It is, of course, unfortunate that betting must always hold so close and conspicuous a relation to turf sports which are made popular with the general public, but it is a fact whose existence may not be denied, and as such must be considered.

Digitized by Google

It is not claimed that dash races should constitute the only feature of trotting meetings, but it is held that as a reasonable business proposition the breeders of trotting horses and the managers of trotting tracks can not afford to be so blind to their own interests as to cling tenaciously to customs that are far behind the spirit of the times. A great many people, when this subject of dash races for trotters is broached, at once declare that to countenance its introduction would mean the deterioration of the American trotter. They claim that it is stamina as well as speed that we are breeding for and that this element cannot be secured or maintained unless the heat system of racing is adhered to. There is not so much force in this argument as at first blush would seem to be the case, while on the other hand it is not an uncommon matter under the present system of requiring that a horse win three heats before he is entitled to the race, to see a field of trotters and pacers made to exert themselves mile after mile until they are utterly weary and those who drive them amenable to the law for the punishment of cruelty to animals. Every trotting-horse driver, every breeder, every man of sense who goes to the races, knows this to be true. How about that race for pacers three years old and under at Independence a year ago this month when twelve heats were required to settle the question of supremacy? "I felt sorry for those poor horses," said Budd Doble, a great driver and a humane man. Other instances of like character but perhaps not so marked might be given, but it is not believed that a point taken in this regard will be disputed by any man of experience.

Dash racing for trotters and pacers is coming. Already the Kentucky Trotting-Horse Breeders Association is considering the advisability of offering purses for dash races at various distances at its meeting next October, and one event of that character, a dash of a mile and a quarter for horses of the 2:15 class, has already been announced. What is wanted on this subject is an expression of opinion from breeders. They are the men who can carry the day with the management of trotting tracks and they—especially now that colt stakes are a feature of trotting meetings—are the parties most deeply interested. Mr. J. C. Sibley, of the Prospect Hill stock farm, an establishment which is turning out successful young trotters every season and whose expenditures in the way of nominations to trotting stakes amount to thousands of dollars, was asked by the editor of the MONTHLY for his views on this subject, and he replies as follows:

"I have believed for a long time that more variety should be given to the patrons of trotting tracks, and would hail with pleasure dash racing. I should especially like to see races given which should have two-mile dashes and two-mile heats for the respective classes. To make short dash races would in my judgement be going backward and losing the stamina that we all so much desire in the race horse, and I hope the time will never come that the dash will be for less than a mile. Nothing can more surely test the race-horse qualities of an animal than long-distance events. Four or five-mile dashes will give the superior horse a chance to assert himself, no matter how many start, and will more truly determine race-horse qualities than the five or seven-heat races where a good horse may be interfered with by parties interested in the pool-box. I hope we have some that could participate in that kind of an event. If we do not have them that can do so creditably I should certainly feel that it was necessary for us to commence anew and procure such animals as could engage in this style of races."

Mr. C. J. Hamlin has unquestionably sent more trotters which possess both extreme speed and great campaigning qualities to the front during the last few years than any other breeder, and his village farm establishment goes through each recurring campaign with one of the most formidable trotters and pacers in the country. Twice have its representatives won the $10,000 Charter Oak stake at Hartford with Prince Regent and Nightingale, that were sired by Mr. Hamlin's stallion, Mambrino King, and from mares owned by him. He has also bred the champion double team and driven them a mile himself over the Independence better than 2:14. He is a successful breeder of trotters and a first-class driver, and none of the mysteries of properly fitting a horse for a race are beyond his ken. His reply to a letter suggesting that his views on the subject of dash racing on the trotting turf would be of interest to the readers of the MONTHLY is brief but virile.

"I know of no successful breeder of game-trotting race horses who favors or ever will favor dashes or cup records. If you can embellish the above go head, I can't."

In the matter of cup records or authentic trials against the watch under other names, Mr. Hamlin's position is well known, and it is that of many other lovers of the trotting horse who do not believe that any value is added to the strain of blood by having a

Digitized by Google

number of its representatives make one-heat flights against the watch on a carefully prepared track and a day selected for its favorable conditions to fast time. Other breeders defend the cup system of making records on various grounds, chief among which is that in most instances it is a troublesome and expensive task for a horse to obtain a record close to the limit of his speed by making a campaign. As to the relative value of race records and those made in contests against it, there will hardly be any dispute among breeders, and there is none at all among purchasers of trotting stock, for which reason it is perhaps just as well to continue recognizing both kinds of performances for purposes of registration and establishing speed limits, inasmuch as the time trials will, in a measure, carry their own penalty in disposing of the animals which make them, or of their produce.

It is a different matter, however, when the question of dash races is considered, because it does not necessarily follow that the adoption of the dash in place of heats will result in the deterioration of the trotting horse's stamina. On the contrary, as Mr. Sibley very forcibly puts it, a dash of from three to five miles will establish the game qualities of a trotter in just as great a degree as would a prolonged contest of heats. One great trouble with the heat system is its lack of variety and also the ever-present fact that there is no telling to what lengths a race may be strung out and horses engaged in it thereby unnecessarily punished. It may be a three-heat affair or it may be one of twelve heats, as instanced above. It is not within the realm of possibility that any one would attempt dash races at less than a mile, and were the system given a fair trial it would doubtless be found that events at the greater distance would be most popular. There are other ways in which the dash system would work to the advantage of horse owners, by giving the public better entertainment in some respects than is possible with long races of heats. In the matter of scoring, for instance, it would be found that when a field of horses was marshaled to go a journey of two miles or more there would be very little scoring indeed, no matter how large the field, because every driver knowing that there would be plenty of time in which to display the speed of his horse and utilize his own tactics of reinsmanship, would be anxious to get away with as little delay as possible, and all who have followed the races are well aware that when the drivers try to effect a start it is not long in being obtained. With Mr. Sibley's views as to distance adopted, one great objection to dash races is dissipated, and we are sure that no one will see this more quickly than Mr. Hamlin, who is nothing if not practical.

Mr. Foxhall A. Daingerfield, of Culpeper, Va., a gentleman whose love for the trotter is intense, and who, it may be said incidentally, is a strong and eloquent advocate of trotting blood for trotters, says, in reply to the request of the editor of the MONTHLY that his opinion on the subject of dash racing be furnished for publication:

"I view the system of dash races as a dangerous innovation, very likely to be adopted by our trotting associations in the near future, and *sure to be followed by more disastrous results to the trotter than it has been to the thoroughbred.* The main value of the roadster being his stamina and ability to 'last all day' or repeat rapid and long-sustained efforts on the road when required for business or pleasure, anything tending to induce breeders to look to speed alone in the trotter (as they now do in the runner), as his only element of value, must degrade the most useful of all equines to a mere gambling machine.

"I should regard records in dash races as more misleading to purchasers than tin-cup records (which are held as evidence of speed alone), for they would probably be esteemed as furnishing evidence of some other racehorse quality not possessed by the holder. It is not an unheard of thing for horses with records, in first heats, of 2:12 to 2:13, to melt away and be disgracefully beaten by a 2:20 performer that can last six or seven heats at or about his clip.

"For horses three years or over I favor three-in-five, and for colts under three years, best two-in-three heats, for both trotters and pacers. FOXHALL A. DAINGERFIELD."

Mr. F. S. Gorton, well known as a breeder, writes:

"The Northwestern Breeders' Association had some dash races at their meeting of 1891, which seems to please the horse owners and people very much, but they were arranged the last thing on the program, when every one was tired and ready to go home, and were not given a fair trial. The idea of a dash race each day is to have it come off to take the place of any delay, to keep the audience constantly enter-

tained. They were strongly favored by one member of that association, as he believed they should take the place of the tin cup. With a horse that could win in those large fields, a single dash better than 2:30 would be given more credit by any thinking buyer than if he had a record two seconds faster against the watch. This member that advocated them in 1891 is still as firm in his opinion as he was before they were tried. The fields were always large. The Association added $200 and charged only $5 entrance. These dashes could be given on any kind of a plan regarding the purse, and if the amount was large enough for trainers to prepare their horses for a very fast mile we would see all race records beaten, and I predict would become very popular.

"The dash races have never had a fair trial."

Death of Palo Alto.

It was announced by telegraph June 22, that the stallion, Palo Alto, 2:08¾, which record is the best for an entire horse at the trotting gait, had died the previous night at the farm of his owner, Senator Stanford, in California. Few horses were better known to the general public than Palo Alto, and his death at a time when he had reached the zenith of fame and was just entering on a career in the stud which bade fair to perpetuate his name is an irreparable loss to the breeding interests. The story of this horse, that beginning with a public trial in 2:23¾ as a two-year-old fought his way up inch by inch until he reached the top of the ladder of fame, so far as trotting stallions are concerned, is not a long one, and it is full of interest.

Governor Stanford began his breeding operations at the Menlo Park ranch about fifteen years ago, using for his premier stallions the Hambletonian horses Mohawk Chief and Gen. Benton. In those days there were scattered through California a large number of mares by the pacing horse, St. Clair, a stallion concerning whose blood lines nothing is known. He, however, sired a good deal of trotting speed from the ordinary mares of the country, and the first really crack trotter that Governor Stanford owned—Occident, 2:16¾—was a member of the St. Clair family. It was natural, therefore, that in his breeding operations he should turn to this same blood for his broodmares, and from them he succeeded in giving the world a number of remarkably fast young trotters for those days. It was not, however, until in 1877 Governor Stanford came east and bought the Hambletonian–Clay stallion Electioneer that the Menlo Park establishment was in a fair way to become famous as the nursery of phenomenal trotters. Electioneer's first fast trotting colts, the most prominent among whom were Fred Crocker and Bonita, were from mares with a good deal of St. Clair blood in their veins, and subsequently another daughter of that horse produced in Wildflower and Manzanita the two and four-year-old champions of their time. After the fact that Electioneer was a remarkable sire had been demonstrated and the horse himself was well along in years, speculation naturally turned in the direction of forecasting which of his sons would be selected to take the old horse's place in the stud when death should claim him.

It had long been a claim of Governor Stanford's that with a horse of great action-controlling power like Electioneer it was possible to produce from strictly thoroughbred mares a type of animal that would combine the swift trotting gait of the Hambletonian family with the admitted great lung power and fine bone of the thoroughbred. Governor Stanford believed that this combination would eventually produce the fastest trotters in the world, and being a man of great determination in the exploitation of any idea which engaged his attention, he has for the last dozen years or so made the mating of Electioneer and thoroughbred mares a special study. That he has succeeded beyond the expectations of those who are not favorable to such violent crosses is an admitted fact, and the brightest jewel in all the crown of equine stars produced by breeding thoroughbred mares and Electioneer was Palo Alto. It was by reason of his unquestioned ability as a trotter when he was in training as a two-year-old that the colt from Dame Winnie was named Palo Alto, in honor of the farm where he was bred, and even then, half a dozen years ago, it was said that Governor Stanford liked his way of going so well and was so impressed with his physical conformation that he had decided to reserve him as the successor of his sire. As a three-year-old Palo Alto did not do any trotting, but in his four-year-old form he came East and won nearly every race in which he started, trotting most of the time against aged horses and closing the campaign with the race record of 2:20¼. Since that time his history has been a familiar one to the public. Although a horse of phenomenal speed he has not been reserved exclusively for exhibitions against time, it having always been the policy of his

Digitized by Google

owner to trot Palo Alto against other horses whenever an opportunity presented itself, and on some occasions he has made memorable performances, notably the one at Chicago two years ago this summer when, trotting against the gray gelding, Jack, the fastest representative of the Pilot Medium strain of blood, he stepped close to the fastest three heats on record by a stallion up to that time. Last year Palo Alto, although troubled with an ailing leg, was fitted by Marvin specially for trials against the watch, and after a number of efforts over the kite track at Stockton he succeeded in reducing his record to 2:08¾. Previous to this he had been rather unfortunate, as although his miles were always extremely creditable ones, Stamboul and Axtell had beaten him a little in the race for championship honors, and subsequently Nelson and Allerton proved themselves most troublesome opponents. The 2:08¾ mark of Palo Alto, however, made last fall, kept him safely in first place, and although it was entirely within the limits of possibility that even so great a performance would be bettered during the present season it was thought that the California stallion also had a chance to cut it down as he seemed to have entirely recovered from the weakness in one of his legs, which had formerly at times made him lame, and was going better than ever up to the time he was taken sick a couple of weeks ago. There has been a great deal of sickness and mortality among horses all over the country this season and the Palo Alto establishment is no exception to the general rule. It is only a short time ago that one of the most valuable horses owned there, Advertiser, that is by Electioneer and out of a George Wilkes mare, his second dam being the old-time trotter Lula, was prostrated with pneumonia, and for a time his life was despared of. Advertiser made a record of 2:16 as a three-year-old last season and was one of the stallions for whom Senator Stanford would not entertain an offer. Hardly had he recovered when Palo Alto was taken sick and in spite of all that the best veterinary attendance could do he died as stated above. Now that he is gone there will be no chance to ascertain whether or not like another son of Electioneer, Ansel, that is out of a thoroughbred mare, Palo Alto would have achieved success in the stud, but inasmuch as in gait, appearance and general disposition, he took entirely after his sire, in no respect resembling his dam, it is only fair to assume that had he lived there would have sprung from his loins a race lusty young trotters that would have been credit to their illustrious progenitor.

Palo Alto's turf record is such a brilli one that it is herewith given:

Regulate the Pool Box.

At the Hartford meeting not long ago the favorite in the 2:26 pacing class was the chestnut gelding Charles L., and after he had won a first heat in 2:20½, and in doing so shown that he outclassed the rest of the starters by three or four seconds, he was distanced in the second heat by reason of a bad break. Of course it is a suspicious circumstance, and one

Digitized by Google

that should always be looked into carefully by the judges, when a horse that is favorite in a race before the start and that wins the initial heat in fast time, is afterward behind the flag. Everybody knows that pacers are ordinarily not as handy in recovering from a break as are trotters, but even at that it is only once in a long time, that, with ordinary care on the part of the driver, a pacer that has the speed of his field need be distanced simply because in some particular heat he is unsteady. Of course it is impossible for the judges to in every instance reach a fairly accurate conclusion as to whether or not there is in cases like the one referred to, a job, unless they pay strict attention to the betting and do not content themselves with a glance at a pile of tickets on his own horse exhibited by the driver of the animal which is distanced or being beaten in slow time after winning a heat or two. It is the easiest thing in the world for a driver, preparatory to a contemplated "dump" of those who bet on trotting, to provide himself with a stock of pool tickets that are ostensibly on his own horse to win, but if in such cases the judges would demand that the pool books on the race be brought to the stand and have them examined by an expert in such matters they would in many cases discover the exact locality of the African in the woodpile.

It is in fact about time in the history of the American trotting turf that the pool selling be taken under the wing of the track management, and not sold out at auction to parties, who, no matter how great their financial responsibility may be, have no interest in checking fraud, and who frequently are of the moral caliber which, not content with merely winking at such matters, enters into active participation in them for the money that is to be made thereby. In such instances the poolseller is known as a "macer," as his position makes it possible for him to know just how everybody's money is being bet, and it is a fact not susceptible of successful denial that no job of any magnitude in a trotting race can be put through without the knowledge of those who have the pool box in charge, and it follows that if they were honest enough to denounce every such scheme fraud would practically be eliminated from the trotting turf. But the pool seller's interest is not in the direction of spotting jobs. On the contrary it lies the other way. A job in a trotting race means plenty of betting by men who imagine that they have a sure thing, and as the poolseller gets a percentage on the amount bet he is anxious to see go into the box as many dollars as it is possible to wager on the event. He not only says nothing to the officers of the track, when it is plain to him that a job is being prepared, but almost without exception he evades in every possible way a truthful answer to the questions put to him by the judges and others when it is time to ferret out a turf swindle. Once in a while if it comes to a pinch some pool sellers will tell a string of lies and swear to them.

These statements are based on facts known to a great many people who have seen more or less of the seamy side of the trotting turf during the last two decades. Hardly a season passes that some pool seller is not involved in a scandal (which means a swindle), and yet not one of the fraternity has been punished. As far back as 1877, when at the Utica, New York, meeting, the celebrated Edwin Forrest race brought the trotting turf into disrepute with the general public it was found difficult to open the mouths of pool sellers to such an extent that their testimony was of any value. The Edwin Forrest race resulted in such prominent drivers as Dan Mace, Gus Glidden and Morrell Higbie being temporarily retired from the public exercise of their avocation, while a more inconspicuous figure in the sulky, a man named Pyle, flared up in the bright light of publicity and flickered out to be heard of no more, until, ten years later he assumed some prominence in the far west as a breeder of trotters. One Tufts, a poor wretch of a boy who had been poorly paid while training and driving the mare Loretta F., was found to have succumbed to the seductive influences of a few hundred dollars and pulled the mare. He was promptly expelled. It came out then in the most convincing manner to every man who examined the evidence that a well-known pool seller was mixed up in the Loretta F. robbery from start to finish. Was this pool seller prosecuted? Not at all. Was he stopped from doing business on tracks belonging to the association of which the Rochester course was a member? Nothing of the kind happened. Last year, again, there was a palpable job in the most important race at the Baltimore spring meeting, a stake in which the money offered was far beyond the usual amount to be contested for in a trotting event. It was deemed a certainty that this race could be won by a certain horse, and he did capture two heats in such style as to leave no doubt of his superior-

Digitized by Google

ity over the other starters. He was pulled and hauled around the track by his original driver, another driver was "stopped" by those who had been betting against the horse, and finally the whole affair wound up with the expulsion of some people, a portion of whom were afterward reinstated. The owner of the horse, a man against whom no evidence of complicity in the scheme was ever made public, suffered along with the rest, but the pool seller who was publicly charged with being at the bottom of the job got away all right as usual.

The present high standing of the trotting turf and the trotting horse business has been brought about solely by reason of the fact that the breeders of trotters, who are almost without exception men of undoubted honesty and with clean, successful business records, have of late years begun trotting the produce of their farms in public races. Through no other cause could this metamorphosis in the affairs of the trotting turf have been produced, and it is therefore the duty of breeders to see that the trotting turf is purified in the direction where it has long been the most odorous and where reform will do the greatest good. The pool box is may be a necessary adjunct of the trotting turf. On the running turf the life, vitality, and moving power of the whole structure is the betting. On the trotting turf the betting is an inconsiderable feature, but still it is something without which it is probable that large trotting meetings could not be successfully conducted. The natural inclination of the American people who patronize out-door sports is to mingle a little speculation with the other pleasures of the day, and it is also true that men who own horses and trot them for public purses are, almost without exception, ready to back their candidates somewhat on the day of the race. Poolselling may not, therefore, be disassociated from the trotting turf, but even taking the ground of the most conservative people on this question and admitting that the pool box is an evil, it is still better to regulate an evil than to ignore its existence and thereby increase its power for harm. It is through dishonest manipulation and by the jobbing of races through the pool box that the trotting turf, and incidentally the trotting horse, and to a greater or less degree the men who breed trotting horses and race them, are brought into disrepute with a certain section of the American people.

There is no occasion for this. There is not the slightest reason why the pool box feature of trotting meetings can not be conducted with as strict an eye to honesty as any other part of the entertainment. The trotting associations owe it to themselves, to their members, to breeders, and to the general public that some action in this matter be taken. The trotting season of 1893 should be marked by official control of the pool box. The time is ripe for the passing away of the day when an individual or firm shall control this privilege at any meeting. It is a source of much income to the tracks, which income is contributed directly by the public which attends the meetings, and therefore that public should be protected to the utmost. As matters now stand it is protected very poorly indeed, and in many cases not at all.

Let private control of pool selling cease.

Another Great Brood Mare.

By virtue of some recent trotting at San Jose in California there was an entry to the 2:30 list which placed the Electioneer mare Wildflower in the "Great Brood Mare" table, two of her produce having become standard by performance. They are Wildmont, by Piedmont, that made a record of 2:27¼ as a three-year-old in 1891, and now Wild Bee, a three-year-old sister to Wildmont, has taken a mark of 2:29. This circumstance, which in itself is a great credit to any mare, recalls the fact that in her day Wildflower was a trotting wonder, as on October 22, 1881, nearly eleven years ago, she placed the trotting record for two-year-olds at 2:21, and it was rightly estimated that her performance would stand longer than any other champion mark at that time on the books. This proved to be the case, as it was not until 1888 that the 2:21 performance of Wildflower was bettered by Sunol, who eventually closed the season with a two-year-old record of 2:18, since which time two others have beaten her mark and a third has equaled it, they being Ralph Wilkes, 2:18; Monbars, 2:16½, and Arion, 2:10¾.

There is a little doubt that had Wildflower not met with a sickness in her three-year-old form which destroyed her usefulness as a trotter she would have been among the fastest of the get of Electioneer, as up to the time she succumbed to the effects of a severe attack of pinkeye Marvin rated her very highly indeed. She was foaled in 1879, and to have two representatives in the 2:30 list at twelve years of age is a remarkable showing for any mare, so that

Digitized by Google

Wildflower may fairly be considered a precocious broodmare as well as a phenomenal colt trotter. Her success in the breeding ranks is of course something of a feather in the cap of those who argue that developed sires and dams are the ones to which we should look for the fastest trotters and for the greatest development in the way of speed production generally. It is unquestionably true that among the famous young trotting sires of the present day those whose speed has been developed and tested on the race track are largely in the majority, as was shown in a recent number of the MONTHLY, Guy Wilkes, Sidney, Quartermaster, Director, Eagle Bird and others being conspicuous examples. It used to be argued —and with an unquestioned foundation of truth—that by campaigning a stallion or mare for a number of years the vitality of the animal was more or less impaired, and, with this premise to start from, the opponents of the developed sire and dam idea were prone to argue in favor of full brothers or sisters to noted trotters for use in the breeding ranks rather than the great performers themselves. It soon became apparent, however, that in some instances campaigning did not sap the vital powers of stallions to an appreciable extent, George Wilkes being a case in point. In those days, however, stallions capable of trotting better than 2:25 were not common, and those with records of 2:20 or better could be counted on the fingers of one hand, whereas at the present time there are 2:25 stallions galore and a longer list of entire horses with records below the 2:20 mark than anybody who has not looked the matter up would imagine could possibly be the case.

However, there is at the present time a vast difference in the treatment of trotting stallions from that accorded them a decade or so ago. At the present rate of production of trotters of all grades, from the 2:30 performer to one that can beat 2:10, it is an unprofitable venture to campaign a horse at all unless he can win a race now and then, in order to accomplish which feat it is necessary that he take a record about equal to his best speed. Once this point is reached he is outclassed, unless he be one of the sensational variety, and therefore the most remunerative use that can be made of him is to place him in the stud. The horses of the present day, therefore, which are offered for public service or retained for private use, and a part of whose equipment in the breeding ranks is a fast record, have not been campaigned sufficiently to in any degree impair their vitality, and the same may be said of mares with fast records that are raising colts. In the case of a mare like Wildflower, that was a world-beating trotter of her age when two years old, there was no chance to exhaust her vitality, because a baby trotter will recover from a great effort much more quickly and also more fully than one that has reached maturity. Wildflower is bred in lines that with each recurring trotting season demonstrate on the race track their potency in the production of trotting speed, she being by the Hambletonian-Clay stallion Electioneer and out of a mare with a trotting record of 2:30½, made a great many years ago. This mare was sired by the pacing stallion St. Clair, concerning whose pedigree nothing is known. She was made to trot only by the use of a great deal of weight on her forward feet, her natural gait being the pace, and yet the speed element in her was so prominent and dominated her nature to such an extent that when she was mated with Electioneer she produced a couple of world's champions in Wildflower, 2:21 as a two-year-old, and Manzanita, 2:16 as a four-year-old. Now that one of her daughters is in the "Great Brood Mare" list, it is demonstrated that the blood of Electioneer and Mayflower will breed on, and as Manzanita, the sister to Wildflower, is a beautifully gaited mare and never wanted to do anything but trot it is fair to assume that she also will become famous in the breeding ranks.

Wildflower's two foals that have beaten 2:30 are by Piedmont, a horse whose record was made in the fourth heat of a winning race against a good field, he following up that performance by winning the fifth and sixth heats as he liked. That the blood of the old pacing stallion St. Clair, whose breeding is wholly unknown, was to prove an important factor in the pedigrees of California trotters was demonstrated beyond question when the get of Electioneer that were out of mares by St. Clair began trotting fast and beating all the records previously made by horses of their age. In addition to siring the dam of Wildflower and Manzanita, both record-breakers, St. Clair also got the dam of Bonita, that at one time held the two-year-old trotting record, and of Fred Crocker that was also a two-year-old champion in his day, so that at different times three two-year-old trotters out of mares by St. Clair have been world's champions. This in itself would be an incontrovertible argument as to the

Digitized by Google

lue of the blood of St. Clair, and incidentally pacing blood, in trotting pedigrees, espe-lly as it is now generally conceded that the t and pace are interchangeable gaits and tely to be produced by either trotting or ing sires or dams. But the sons of St. Clair ve also been the progenitors of creditable tting and pacing speed, as Dietz's St. Clair ed the dams of the pacer Yolo Maid, 2:12, lle Button, 2:19¾, and the trotter Gen. gan, 2:23¼, while Doc, a son of St. Clair, ed Occident, 2:16¾, and another son, St. ir 656, has two trotters in the 2:30 list and also the sire of the dam of one trotter and o pacers that are standard by performance. hootz's St. Clair sired the dam of Ladywell, 16½, and Lorita, 2:22¾, so that on the whole e showing made by the St. Clair blood, pecially in the female line, is a remarkably eritorious one when it is considered that its hances have not been remarkably good. It true that the performing foals of Wildflower ve not been, like their dam, sensational colt otters, but this fact does not at all impair the rce of the showing that she has made in vor of developed mares as dams.

Close on the heels of what the produce of Wildflower have been doing in the way of ntering the 2:30 list comes the information hat Anselma, that is by Ansel, 2:20, and out of Elaine, 2:20, recently made a record of 2:29½. Elaine, as is well known, is a product of the Hambletonian-Clay cross, being by Messenger Duroc, a son of Rysdyk's Hambletonian, and out of the famous Clay mare Green Mountain Maid. Like Wildflower, she was a phenomenal colt trotter, holding the record for three-year-olds when the mark for trotters of that age was only a little below 2:30, and she subsequently placed herself on a par with the big black gelding Prospero as the fastest of the produce of Green Mountain Maid by getting a record of 2:20. It is true that, technically speaking, Elaine is not yet entitled to a place in the "Great Broodmare" table, but as a matter of fact, she should rank with many that are members of that distinguished company, inasmuch as in addition to having Anselma in the 2:30 list at a fairly early age, she also produced the sensational trotter Norlaine, that in her day reduced the yearling record to 2:31½. It is of course necessary in formulating rules by which admission to any class is regulated that there shall be laid down certain lines from which no deviation may be made, but at the same time it is of value and interest to those who study blood lines and performances with a view to using the information contained therein to learn of facts which bear directly on the proposition they are endeavoring to solve. From this standpoint the 2:29½ performance of Anselma and the 2:31½ mark of Norlaine as a yearling give Elaine great distinction as a broodmare, and it is only fair that her work should be in some manner set aside from something ordinary in the same line and given the distinguishing mark it deserves. It is also a noticeable fact that, like Wildflower, Elaine, in addition to having been the three-year-old trotting champion of her day, has produced her fastest foals by stallions that are also exponents of the developed speed idea in sires, as Norlaine was by Norval, 2:17½, and Anselma by Ansel, 2:20. The Norval foal, it is also worth noting, was much the faster of the two, as the records show, being able to trot about as fast when a yearling as Anselma is at a more advanced age, and this will not be overlooked by those who are in favor of trotting-bred stallions, because Norval conforms in his blood lines more closely to trotting strains than does Ansel, the dam of the latter being a thoroughbred running mare.

Grimes and Others.

It would not be a bad idea for the trotting track at Mansfield, Ohio, to begin some sort of proceedings against the driver Gee Grimes in order to ascertain just what latitude that person and others of his ilk have when it comes to deciding how a trotting meeting in which they are interested to the extent of having made entries in various classes is to be run. At a recent trotting meeting in Mansfield it appears that Grimes was dissatisfied with the action of the judges concerning a certain race in which he was engaged, and he also took exceptions to the manner in which the starting judge performed his duties. A newspaper published at Mansfield said at the time of the meeting that in one race the distance flag would have fallen in front of the mare Belle Durland driven by Grimes, had not one of the stable hands employed by him snatched it from the distance-judge's hands. It was after this episode that the immaculate and sensitive Mr. Grimes found fault with the starting judge and demanded that he be taken from the stand. When the officers of the Association very properly refused to pay any attention to this impudent demand on the part of a driver

Digitized by Google

whose career bristles with "queer" races, Mr. Grimes packed up his traps and left town, stopping long enough at Cleveland to have himself interviewed by a newspaper reporter in order that he might unload a tirade about the Mansfield track and its management.

If Grimes had what was honestly coming to him he would have been off the trotting turf long ago, and there are plenty of men who know this. About three years since he pulled the pacer Fred Arthur in the most deliberate manner at a meeting of the Northwestern Breeders Association held in this city, and the judges on that occasion, among whom were Congressman John L. Mitchell, of Milwaukee, and the late Charles M. Smith, of Earlville' Ill., took prompt action. After Fred Arthur had lost two heats to Maggie R. in 2:18, 2:19¼, finishing in fourth and second positions, they took the horse away from that driver, the race being postponed until the following day. Up to that time the judges had, of course, no absolute proof of Grimes' guilt, but the next morning Messrs. Mitchell and Smith, who were in the club house at Washington Park, were sought out by Mrs. Grimes, who told them a most pitiful story of her husband's position, of his failing in the way of strong drink, and admitted to them, for him, that he had been pulling the horse. All she asked of them for her husband was that instead of another driver being put behind Fred Arthur to finish the race her husband be permitted to retain his seat in the sulky, promising that if this were done Fred Arthur would win, and win so easily that at no time would the result be in doubt. Both Mr. Mitchell and Mr. Smith had been firmly convinced of Grimes' guilt, but, of course, this confession and plea of the man's wife clinched the matter. They deliberated for some time, not even then having any faith in what Grimes said, but they knew that if another driver were put up by them and Fred Arthur won the race there would be no other logical course for them to follow but to expel Grimes, and out of pity for the man's wife and children they were inclined to avoid doing this if possible. The result was that Grimes went out and won with Fred Arthur in such an easy manner as to demonstrate beyond question that he had previously been pulling the horse's head off. He was not expelled, and since then has risen a little in his business. No doubt success has made him impudent as well as bold, but perhaps now that the facts of the Washington Park episode and his acknowledgment of guilt in that race are recalled he will behave himself a little more as a convicted man should, and not be so ready to tell other people how to conduct their business.

Get Rid of the Rascals.

AT the recent Philadelphia meeting a grey gelding called Senator K., won the last three heats of the five-heat race for horses of the 2:34 class, simply and solely because his driver was taken out by the judges after the horse had been beaten in 2:32½, and an honest man put up, who drove Senator K. to the wire in the next heat in 2:24¼, winning handily and distancing not only the horse that had beaten him the two previous heats, but a couple of others; then he went on and won the race in a jog, after which the judges, instead of expelling his owner, W. K. Weidensaul, fined him $100 for his conduct. What is needed on the trotting turf is an honest enforcement of the law, and it is such juggling with the enactments already on the books that disgusts the public and drives reputable men out of the business. In the case at Philadelphia there was no question, according to the reports of the race, which were endorsed by the action of the judges, as to the guilt of the man who owned Senator K. and drove him the first and second heats. In the second mile the horse was beaten only a little in 2:32½, and it was his being pulled directly under the eyes of the judges that induced them to put up a new driver, who, as previously related, proceeded to distance the horse that had just been beating Senator K., trotting a mile with the latter about ten seconds faster than he had previously shown. Now, if the judges didn't believe that Weidensaul was guilty of pulling Senator K., there was certainly no occasion to fine him $100, and if they did believe him guilty there was no occasion or excuse for fining him, but every reason in the world for expelling him. It is this paltering with justice and with men whose acts entitle them to immediate and perpetual ostracism from the fellowship of other horsemen that makes the trotting turf on such occasions appear cheap in the eyes of the public. There should be absolutely no fining a man when he is tried and found guilty of pulling a horse. His offense is one which strikes at the very roots of a successful carrying on of public trotting and he is the most determined as well as the most despicable enemy that sport can have. Millions of dollars are invested in breeding the American trotter, and

Digitized by Google

is principally by means of great trotting meetings that his speed can be shown and the animal made saleable at remunerative figures. In the past, skullduggery of various kinds brought the trotting turf almost to the level of a dog fight, and now that it has been raised from the sinkhole of iniquity into which pick-leg gamblers at one time plunged it, there should be no chances taken as to its future. The instance at Philadelphia, where a man who had pulled a horse was fined a paltry $100 instead of being expelled, was paralleled at Chicago last summer during the meeting given under the auspices of the Northwestern Association of Trotting-horse Breeders. Driver Dick Wilson, who hails from Indiana, had in one race a mare that by her previous performances was rightly a favorite over the field. Under Wilson's management she was pulled and hauled all over the track, forced to repeated breaks, and an evident attempt to distance her made. An honest driver, George Starr, was put up, and, starting from an outside position in a large field of horses, he drove his mare, Letta C., a mile fully ten seconds faster than any she had previously gone, demonstrating beyond the possibility of a doubt that Wilson had not tried to win with her. The public knew this. It saw the performance of the mare in the hands of a dishonest driver and the honest one. It cried out for justice. The judges were satisfied that Wilson had pulled the horse. Did they expel him? Not at all. They fined him $100, taking his action, presumably because Wilson was interceded for by a man prominent on the trotting turf, who might have been in better business. That decision hurt trotting in Chicago to an extent that few people imagine. What Wilson deserved that day and what Weidenaul deserved at Philadelphia was immediate and perpetual expulsion, and breeders should see that the Punch-and-Judy performances that so often take place in the judges' stand are done away with forever.

Put the horse puller off the turf for good.

A Big Fraud.

On the 2d of last February Registrar Steiner received the following letter:

"SALEM, NEW JERSEY, February 2, 1892.

"J. H. STEINER, Registrar,

"*Dear Sir:* I enclose you application of my own stallion Dictawood, by Dictator, 113, with fees and proofs. He is the property of Mr. H. P. Brown, of Crooks, Ky., who has asked me to attend to the matter for him.

"Please send me acknowledgment when you receive this, and if any more proof is necessary shall be pleased to furnish it.

"E. H. SMITH."

The pedigree of Dictawood as given by Mr. Smith was as follows:

Name—Dictawood.
Color and sex—br. h.
Year foaled—1879.
Bred by—H. C. McDowell, Lexington, Ky.
Got by—Dictator 113; son of Hambletonian, 10.
Name of dam—Rosewood; record 2:27.
Bred by—Richard Downing, Lexington, Ky.
Got by—Blackwood 74; son of Norman 25.
Second dam—Rose Edwards.
Got by—Frazier's Mambrino.
Present Owner—H. P. Brown, Crooks, Bath county, Ky.

Along in May of the present year, when it came to the knowledge of Registrar Steiner that the pedigree of Dictawood as given was probably a fraudulent one, that gentleman wrote to Mr. Smith concerning the matter and received from him the following letter:

"SALEM, NEW JERSEY, May 30, 1892.

"J. H. STEINER, Registrar,

"*Dear Sir:* Yours of the 25th instant concerning the registration of Dictawood at hand. This is quite a surprise to me and probably needs some explanation as to my connection with the matter. Being fairly posted on trotting pedigrees, I have been requested to help owners investigate pedigrees and collect proof for registration here in this county. As I found the work to my taste I concluded to advertise for business as I found any quantity of breeders who had no idea how to proceed in the matter and would gladly pay a well-posted man for his services. It was through this ad that I was thrown in with Mr. Brown, who claimed to own the colt by Dictator called Dictawood. After writing me as to his eligibility to registration I wrote him what proof was necessary and after a while I got the bill of sale in question. An incident in connection with the receipt of said bill of sale made me accept it without a doubt, and he either believed it to be genuine or else played a cunning game. I had about forgotten the case, thinking he had changed his mind or something, when I received a letter asking if I had received the bill of sale. He said he had sent his man to the postoffice with some letters, it among the rest, and he had got drunk and didn't know whether he had mailed them or not. In a day or two I received a telegram asking if I had not received bill of sale, which I had not. He seemed much exercised for fear it would be lost. Shortly after this I received it and forwarded it to you. I never had the least doubt as to its being correct, as I was not acquainted with Maj. McDowell's signature. I have to-day written Mr. Brown demanding the certificate and enclosing him your letter. I also enclose you a letter from him to me acknowledging receipt of certificate.

Digitized by Google

"Hoping this explanation will be satisfactory, I am,

"Yours respectfully,

"E. H. SMITH."

Accompanying this letter was the following from H. P. Brown, who had all along posed as the owner of Dictawood.

"CROOKS, KY., April 26, 1892.

"E. H. SMITH, ESQ.,

"*My Dear Mr. Smith:* I am just in receipt of Dictawood's certificate, 18652. You will kindly accept my thanks for the prompt way you done your work. It was received March 22, but I was in California until last Friday. I will send you about a dozen applications just as soon as I can get my work in shape.

"Thanking you again and again, and saying that I am well pleased don't express it, I am

"Sincerely yours,

"H. P. BROWN."

It might be well to explain right here that Brown, so far as learned, is a telegraph operator of no known responsibility. The certificate which Brown forwarded to Smith was as follows:

"Sold to-day to H. P. Brown, Cincinnati, brown colt Dictawood, four white ankles, star, strip and snip, foaled May 3, 1879. Sired by Dictator, 113. First dam Rosewood, by Blackwood, 75; second dam Rose Edwards, by Frazier's Mambrino, for $400, and I hereby release all claim to said colt, in consideration of the purchase money having all been paid.

"H. C. MCDOWELL.

"Lexington, Ky., March 4, 1880."

This alleged certificate purports to be in the hand-writing of Maj. McDowell, the owner of Dictator, and that gentleman was at once communicated with by Registrar Steiner, and the facts of the case stated to him. Under date of May 12, 1892, he replied as follows:

"J. H. STEINER, ESQ., REGISTRAR,

"*Dear Sir*: Yours of the 10th instant received. I have no record nor recollection of ever selling a colt to H. P. Brown, Crooks, Ky. I never gave to him nor any one else a certificate to the fact that I had sold to any one a colt by Dictator, out of Rosewood, 2:27, by Blackwood; grandam Rose Edwards, by Frazier's Mambrino, because I never owned such a mare nor bred such a colt. I have thought, ever since I first heard of this horse, that he was a fraud. I have, however, been careful to say nothing in the matter and have not answered letters of inquiry regarding the horse, as he might possibly have been bred by Mr. Durkee, who did own a mare bred and named as described in this certificate. I believe the pedigree fraudulent, and the mistake made by the party getting it up is a very natural one, as I did own a mare by Blackwood, named Rosewood, but she had but one foal by Dictator, a mare now on my farm. It is just the slip that an unprincipled scamp would make. I have no doubt that on examination of the certificate purporting to have been made by me it will be found to be a forgery. Yours truly,

"H. C. MCDOWELL."

The certificate was thereupon sent to Maj. McDowell, who endorses upon it: "This certificate is a forgery," and wrote Registrar Steiner, under date of May 24, as follows:

"J. H. STEINER, ESQ., REGISTRAR,

"*Dear Sir:* I find on my return home your letter of the 17th inst., inclosing what purports to be a certificate given by me to H. P. Brown, Cincinnati, describing a colt called Dictawood as bred by me and sold to the said Brown March 4, 1880. This certificate, or bill of sale, is a forgery. I have made such an endorsement on the said paper and return it to you herewith.

"I have not Mr. Durkee's Stud Book, and I doubt very much whether he kept one. The horse did so little when returned to him by Col. West that there was no necessity for a Stud Book.

"There is no question about the fact that this is a palpable fraud, and the parties to it should be thoroughly exposed.

"Yours truly,

"H. C. MCDOWELL."

In the meantime Registrar Steiner had been receiving some further information in regard to the fraudulent Dictawood and his being kept for service in 1891 as Blackwood Chief, 7670, as the following letter will show:

"NEW RICHMOND, OHIO, June 8, 1892.

"AMERICAN TROTTING REGISTER:

"I would like if you would give me a little information in regard to a horse that was represented the season of 1891 as Blackwood Chief 7670. He served some fifty or sixty mares under that name. Now he comes out under a new name and number. He is called Dictawood, but I forget his number. He has just been recently registered. I suppose you will understand the horse I mean, as I don't think there is any other horse by that name registered. He is owned by D. W. Bethel, Owingsville, Ky. There are a couple of colts here by the horse which I will buy providing the horse is all right. There is a great deal of dissatisfaction here in regard to the horse, and I do not want to invest in any of his colts until I know he is all right.

"Respectfully,

JAMES A. BURKE.

To this Registrar Steiner replied as follows:

"CHICAGO, June 9, 1892.

JAMES A. BURKE, ESQ.,

"*Dear Sir:* Your letter of yesterday received. Blackwood Chief 7670, is registered in Vol. VII, under Rule 7, as a brown horse foaled 1876, by Blackwood 74; dam Dictator Maid, by Dictator 113; g d O'Keefe Mare (dam of General Stanton 2545), by One-Eyed Kentucky Hunter; g g d by Long Island Blackhawk 24; bred by C. J. Hamlin, Buffalo, N. Y. The last accounts we have of this

horse he was still in New York state. I have written to Mr. Hamlin to find out his present whereabouts. "Yours truly,

"J. H. STEINER, *Registrar*."

Under date of June 9, D. W. Bethel and H. P. Brown, who had passed as the owners of Dictawood and Blackwood Chief, were written to as follows:

"D. W. BETHEL, ESQ.,

"*Dear Sir:* I am informed that you are the present owner of the stallion Dictawood, registered by H. P. Brown, Crooks, Bath county, Ky., as being by Dictator 113; dam Rosewood, 2:27, by Blackwood.

"Some time since we discovered that this registration had been secured by fraud, and we notified Mr. Brown to return the official certificate of registration.

"We would like to know whether the horse you are standing under the name of Dictawood is the same horse registered by Mr. Brown for which we gave a certificate of registration as having been registered No. 18652, and if so, ask you to return us the official certificate of registration, as we have cancelled the registration, also state when and under what circumstances you became the owner of the said horse.

"We propose to thoroughly ventilate this fraud through WALLACE'S MONTHLY, and hope you will be able to show that you are in no way connected with it, and give you this opportunity to make your statement in the case.

"Yours truly,

"J. H. STEINER, *Registrar*."

The letter to Brown was as follows:

"H. P. BROWN, ESQ.,

"*Dear Sir:* On the 27th day of May, 1892, I wrote you a letter demanding the return of the certificate of registration of the brown stallion Dictawood 18652, and notifying you that we had cancelled the registration on account of fraud. We have had nothing from you in regard to this demand, and again request you to return the certificate and show cause why you should not be put on the black list for procuring a registration by fraudulent methods.

"Yours truly,

"J. H. STEINER, *Registrar*."

Of course nothing was heard from Brown, but Dr. D. Bethel replied under date of June 15, as follows:

"OWINGSVILLE, KY., June 15, 1892.

"J. H. STEINER, ESQ.,

"*Dear Sir:* Yours is just before me. In reply will say that I bought the horse from Brown on March 4, 1891. At the time he gave me written statement of his breeding, giving me a note of hand to have him registered. This he neglected to do until I forced him to do it. He then had it done and had the certificate sent to himself at Crooks and gave me an order to get it. I would send you the certificate, but when I got sufficient evidence that the horse was a fraud, I burned it because I wanted no horse that was in controversy, more especially where I could see that it had been done so fraudulently.

"His address was Montgomery, W. Va., but you will see by the returned letter enclosed that he is not there now.

"I hope you will expose this and let it be a lesson to him. I would not again suffer the humiliation for the horse were his pedigree straight. If there is anything I can do to help you in any way let me know, or if anything remains unanswered I will take pleasure in answering it.

"Yours very truly,

"D. W. BETHEL."

About this time some further facts in regard to H. P. Brown came to light, and it was also learned that Dr. Bethel in all probability got the horse from a horse-dealer in Cincinnati named Marks. On June 14, Mr. J. A. Burke of New Richmond, Ohio, wrote:

"J. H. STEINER, ESQ.,

"*Dear Sir:* In reply to yours of the 9th, will say it will do you no good to write to H. P. Brown. He is known as a railroad telegraph operator, and you are just as liable to find him in Oklahoma as Crooks, Bath county, Ky. You write the postmaster there and you will find he is unknown. Mr. Bethel bought this horse from M. M. Marks, No. 111 Court St., Cincinnati, Ohio. Mr. Marks bought him from a man at Warsaw, Ky., name unknown but he was proprietor of a hotel at that place. The horse is supposed to be a saddle-horse. I sent a gentleman to see Mr. Marks yesterday and charged him how he should approach him, which is how I got this information. He says the horse is a high-bred saddle-horse. My agent didn't tell him how Bethel had the horse represented, and he is ignorant of the facts of the case. In regard to the affidavit, will ask you to make two more copies. Send one copy to Mr. Ed. Treaver, Carthage, Ky., also one copy to Mr. Jacob Anderson, same address. Both of these gentlemen bred to the horse the season of 1891 under the name of Blackwood Chief 7670. They are very sore about the matter. Mr. Treaver bred one also bred back this season. Both of those gentlemen are old citizens in high standing and any information you wish in this matter can be had by addressing them. The horse stood the season of 1891, also this season, at Carthage, Campbell county, Ky., handled by a man of the name of Barker, for Mr. Bethel.

"Very respectfully,

"JAMES A. BURKE."

The following affidavit was made in the matter by Mr. Anderson.

"STATE OF KENTUCKY, } 88
CAMPBELL COUNTY. }

"Jacob Anderson, of Campbell county, Ky., being first duly sworn, deposes and says: That during the season of 1891, he bred to a horse standing for service, owned or controlled by D. W. Bethel of Carthage, Ky., advertised as

Digitized by Google

Blackwood Chief 7670. The affiant further swears that he has seen the horse now standing at the barn of Z. F. Barker, Carthage, Ky., owned by D. W. Bethel, and advertised as Dictawood, 18652.

"The affiant further swears that the horse Dictawood, and Blackwood Chief as above mentioned, are one and the same horse.

"JACOB ANDERSON."

"Subscribed and sworn to before me, June 27, 1892.

"W. H. HERNDON,
Deputy County Clerk.
Campbell county, Ky."

REGISTRAR STEINER has in his possession one of the stud bills of the horse variously known as Blackwood Chief and Dictawood. It says that he (Blackwood Chief) "is the sire of four in the 2:30 list," which statement is utterly without foundation and then it goes on to speak of Dictator, the pretended sire of Blackwood Chief, as "a brother of Harold, sire of Maud S., 2:08; Electioneer, the wonder of the Pacific Coast, and George Wilkes, by many thought to be the greatest horse that ever lived."

There is also in Mr. Steiner's office an affidavit from Mr. E. B. Treaver, of Carthage, Ky., stating he bred some mares to the horse that stood as Blackwood Chief 7670 one season and was then registered as Dictawood, in the course of which he says Bethel bought the horse of M. M. Marks, a Cincinnati horse dealer. According to Mr. Treaver, Marks never claimed to know how the horse was bred. Mr. Treaver also enclosed a letter from Dr. Bethel evidently in reply to the one calling attention to the fact that the horse Blackwood Chief was not what he was represented to be. In this letter Dr. Bethel says, "Probably you are not aware that prior to May 19, 1891, two different stallions could be registered under the same name. Such was our unfortunate predicament, hence the change in the name, because the other Blackwood Chief, 7670, was an older horse. Mr. Hamlin never owned the horse that Mr. Barker has, hence of course the difference," etc.

This reference by Bethel to Blackwood Chief, 7670, needs a line of explanation. After standing the horse with the fraudulent pedigree as Blackwood Chief one season Dr. Bethel went to the village farm of Mr. C. J. Hamlin, where the real Blackwood Chief 7670 is owned, and leased that horse for the present season. This was last March, but since then Mr. Hamlin's superintendent has gone to Kentucky and taken Blackwood Chief away from Dr. Bethel, Mr. Hamlin not caring to ha any further dealing with the man. Th whole affair simmers down to this: Dr. Beth stood a horse as Blackwood Chief, und a pedigree that was fraudulent. Subs quently this horse was registered under fraudulent pedigree as Dictawood, the wo being done by H. P. Brown, a telegragh oper tor who can not now be found. Dr. Beth claims that he bought the horse from Brow and that Brown furnished him with a certi cate of registration. He also claims he kne nothing of the fraud and that as soon as came to his knowledge he destroyed the ce tificate which had been sent him by Registra Steiner. On the other hand the evidence Mr. Treaver and one other man is to the effe that Dr. Bethel himself bought the horse Marks in Cincinnati. The MONTHLY leave its readers to judge for themselves as to D Bethel's position in the matter. It may b said that the American Trotting Register A sociation will accept no pedigrees which de pend in any degree upon statements made b Dr. Bethel until this transaction is cleared up and under no circumstances from H. P. Brown

Death of W. H. Wilson.

READERS of the MONTHLY have alread learned, from the public prints, of the deat of W. H. Wilson, which occurred July 14, i a Cincinnati hospital, whither he had bee taken, from Fort Wayne, for treatment fo bowel trouble of a serious nature. Mr. Wil son had for many years been prominent amon trotting-horse breeders; was a man of grea energy and enterprise, and the extensive es tablishment he had built up at Cynthiana, Ky. known as Abdallah Park, is a monument t these qualities in the dead man, as his pat was beset by obstacles and misfortunes of kind that would have daunted a person of ordi nary mold. Mr. Wilson was always far-see ing in all matters relating to the trottin horse and his blood lines, and never was th better illustrated than by his selection o George Wilkes to take to Kentucky at a time when that stallion had absolutely no reputation as a sire. As the man who took George Wilkes to Kentucky Mr. Wilson must always be remembered, so long as the interest in trotting blood survives, but with those who knew him personally his memory will not easily fade away. He was warm and steadfast in hi friendships, and as a husband and father hi qualities are well set forth by his daughter,

Mrs. James, who, at the request of the editor of the MONTHLY, contributes a sketch of her father's life, as follows:

W. H. Wilson was born in 1837 in Whiteside county, Ill. His early youth was spent in and near Chicago. At the age of fifteen, being an energetic boy, desiring to make his own way in the world, he went West. Splitting rails and rafting lumber, driving stage and fighting Indians, his history for some time is that of many another self-made western man. As he grew older he began to handle horses, and was successful in trading and commission dealing. He kept a livery stable at various times. Being fond of speedy horses, and becoming a good trainer, he occasionally drove in races.

He married in 1862, at Lexington, Ky., Miss Annie E. Cook, who with their two daughters survives him. For some years after his marriage he continued the same mode of life, living at different times in Covington, Lexington and Cynthiana, Ky., and St. Louis Mo. Deciding that Kentucky was the best place for him to make a permanent location, he returned in 1872. Collecting a carload of good and stylish roadsters he went to New York city, where he sold them privately, at prices which although remunerative, were not high for the speed they could show. This was his first eastern venture, his sales previously having been made in the south. It was then he met the Simmons Bros., and many of the others who have been his staunch friends ever since.

He had formed the plan of establishing a stock farm in Kentucky and bringing to it a fast stallion of good family. Even then he believed that stallions and mares of good trotting pedigree and individual trotting merit would produce better trotters than those that had no speed, or those in which the speed had not been developed.
